The date of the first attempts at determining latitude by measuring the altitude of heavenly bodies (at first, the fixed stars) is unknown, but Columbus is said to have had a cross-staff (see SEXTANT) for this purpose. Somewhat later the astrolabe was devised. In 1594 the celebrated navigator Davies published in his pamphlet entitled *The Seaman's Secrets* a modification of the cross-staff. In using this instrument the observer stood with his back to the sun looking at the horizon through a sight at the end of the staff, while the shadow of a movable projection fell on the sight box. In 1729 Pierre Bouguer devised an improved form of Davies's instrument. This was followed almost immediately by the invention of the quadrant by Hadley in England, who described his instrument in a paper to the Royal Society in May 1731, and by Thomas Godfrey of Philadelphia, who made an instrument as early as 1730 that was used at sea in August, 1731.

The earliest work devoted specially to navigation was that of Pedro de Medina, published at Valladolid in 1545. In 1530 Gemma Frisius wrote upon astronomy, cosmogony, and the use of globes. In 1537 Pedro Núñez (Nonius), cosmographer to the King of Portugal, published a work on astronomy, charts, and some parts of navigation. In 1556 Martin Cortes published at Seville *The Art of Navigation*. Davies, in *The Seaman's Secrets*, defines three kinds of sailings—horizontal, paradoxical, and great-circle. The paradoxical embraced latitude, longitude, and distance, and combined what are now called traverse and Mercator's sailings. He also gave a clear description of great-circle sailing and the proper method of accomplishing it.

Among the developments in navigation in the nineteenth century were the patent log, the Thomson sounding machine, the Thomson compass, the Ritchie liquid compass, compensation of the deviations of the compass, and the great-circle sailing chart. Almost all the old appliances were much improved, and steam propulsion has greatly simplified navigating problems. Charts (q.v.) are undergoing constant correction and are, considering all things, wonderfully accurate, but much can yet be done and is being done. The most serious enemies of the navigator of the present day are fogs and irregular currents.

MODERN ART OF NAVIGATION.

In the merchant service vessels are taken in and out of port by a pilot. When the vessel is ready to leave port, the pilot (or captain in the United States Navy) takes charge. Men are

stationed at the wheel for the purpose of steering and others at the lead to take soundings. Then by means of buoys, beacons, landmarks, ranges, etc., the ship is kept in the channel. When there is any danger that she may touch bottom, soundings are taken steadily at short intervals. For convenience in entering or leaving port at night, harbor lighthouses and lighted buoys are placed in proper locations. For convenience in navigating many channels, ranges are established. That is, two objects are placed in such a manner that by steering so as to hold them in line the ship is kept in the deep water of the channel. Many of these ranges are formed by two lighthouses and can therefore be used at night.

When the outer buoys and dangers are passed and the vessel is in deep water the pilot is discharged. The position of the vessel is then carefully ascertained by compass bearings or other means. This is called taking the *departure* and may be done at any time before losing sight of the land.

The further navigation of the vessel is effected by means of: (a) dead reckoning (q.v.); (b) compass bearings, or horizontal angles, if proceeding along the coast with the land in plain sight; (c) the lead (q.v.), so long as the depth is not much over one hundred fathoms; (d) observations of the heavenly bodies.

Navigation by means of dead reckoning consists in determining the position of the ship by means of the record of courses and distances sailed which is kept in the log-book (q.v.). (See *SAILINGS*.) When the course of a vessel is along a coast with objects in sight which may be identified and which are marked on the chart, it is possible to obtain the position of the ship at almost any time during the day, and, by means of observations of lighthouses, frequently during the night. When the water is not deep and the coast not clearly visible, an approximate position can be obtained by soundings, but these are not always to be relied upon except within rather wide limits, whereas by compass bearings of objects on shore or by measuring the horizontal angles between three objects the exact position may be determined if the chart is reliable—and charts of much frequented coasts are generally very reliable.

When far from land, the most accurate way of determining the ship's position at any time is by observations of the heavenly bodies. Of these, the most useful is the sun, but observations of the moon, planets, and stars are also taken. The general practice is to determine the longitude by means of the sun in the morning and afternoon, the time when it bears about east or west being the most favorable, and to determine the latitude about noon, when the sun bears north or south. The altitude of the sun above the horizon is measured by means of a sextant (q.v.) and the exact time ascertained by means of a chronometer regulated to Greenwich (in American and British vessels) time. The chronometer may not show the exact Greenwich time, but its error and rate of gaining or losing is known, having been carefully determined in port. From the altitude of the sun its zenith distance is obtained ($\text{zen. dis.} = 90^\circ - \text{alt.}$); the declination of the sun from the equator can be obtained from the *Nautical Almanac*; and the latitude is known with sufficient accuracy from previous observations and dead reckoning. By solving the oblique

spherical triangle whose vertices are at the pole, the zenith, and the sun, and of which three sides (as given above) are known, the hour-angle of the sun east or west of the meridian is ascertained. Correcting this by adding or subtracting the 'equation of time' (derived from the nautical almanac) the mean local time is obtained. The difference between this and the Greenwich time of the chronometer gives the *longitude in time*, which is reduced to degrees in the usual manner.

The simplest method of obtaining latitude, and the one most commonly used, is what is called "latitude by meridian altitude." This is taken at the time the sun bears north or south as it crosses the meridian. The observer knows the approximate longitude. A short time before the body reaches the meridian, he begins to take altitudes of it (usually the sun is taken). As soon as the altitude stops increasing and begins to decrease he knows that the sun has crossed the meridian and that the maximum altitude obtained is the one sought. If h is the altitude thus obtained and d is the declination of the body obtained from the *Nautical Almanac*, then the $\text{latitude} = 90^\circ - (h + d)$, the sign of d being *plus* if the body is on the same side of the equator as the ship and *minus* if on the opposite side. If a meridian altitude cannot be obtained, a spherical triangle must be solved, in which case the time must be as near noon as possible, otherwise a considerable error in latitude may result from a small one in observation or time.

The ship's position when ascertained is *plotted* (i.e. correctly located) on the proper chart and a line drawn connecting it with the preceding position. The continuous line joining the various positions is called the ship's track and shows her latitude and longitude at the different parts of her voyage. As soon as a position is determined and placed upon the chart the navigator determines the course for the next day, or next few hours as the case may be, by finding the course which must be steered to arrive at the point desired. This operation is facilitated by the outline drawing of a compass placed on the chart, the circumference of which is divided into degrees. By means of parallel rulers the direction of the new course is transferred to this compass and the correct course ascertained. The course thus obtained is either the *true* course or *magnetic* course, according to the character of the chart compass, some of which are laid down with the north point directed toward the true north and some with it directed toward magnetic north.

If the log-book of the ship is carefully kept and the speeds and courses accurately determined, the navigator may each day determine not only his position, and the course and run since the previous day, but also the ocean currents, because—neglecting errors in observations, etc.—the difference between the course and run by log (or the dead reckoning) and the actual course and run as determined by astronomical observations is due to current. He also frequently checks the table of compass errors by bearings of the sun—the correct directions of the sun being computed.

BIBLIOGRAPHY. The following reference works may be consulted by the reader in search of further information: Walker, *Navigation* (Baltimore, 1888); Coffin, *Navigation and Nautical Astronomy*, revised by Commander C. Belknap, U.

S. N. (New York, 1899); and *Bowditch's Practical Navigator*, published by the Hydrographic Office, United States Navy, Washington (new editions every three or four years, but all recent editions substantially the same).

Much information in regard to navigation is contained in the following articles: ALMANAC; ASTRONOMY; COLLISIONS OF VESSELS; COMPASS; DEAD RECKONING; FOG-SIGNALS; HELM; LATITUDE AND LONGITUDE; LEAD, SOUNDING; LOG; LOG-BOOK; RULES OF THE ROAD; SAILINGS; SEAMANSHIP; SEXTANT; SOUND, SOUNDING; STEERING; TACKING AND WEARING.

NAVIGATION, FREEDOM OF. The right which all nations possess of unrestricted passage over the high seas. While the right is now universally admitted, it is only within the past century that the question has become a settled one. Formerly claims of territorial jurisdiction were made over large portions of the ocean, and these claims have led to much controversy and frequent international disputes. (See *MARE CLAU-SUM*; *BERING SEA CONTROVERSY*, etc.) But the question of national control in its present phase is reduced to the application of the rule to broad arms or recesses of the sea, narrow seas inclosed within the territory of a single State, straits leading to inland seas, such inland seas and navigable rivers rising in one country and discharging through the territory of another.

Of the first class, bays are generally conceded to belong to the States to which the embracing promontories belong, unless the headlands are so far separated as not to permit of effective defense. Thus Delaware Bay was in 1792 declared to belong exclusively to the United States, and a like claim for Chesapeake Bay would hardly be contested, although the Bay of Fundy is held to be a part of the high seas.

The straits over which international controversy has chiefly arisen are those leading into the Baltic and Black seas. Denmark claimed exclusive control over the former by prescriptive right. As early as 1319 certain prescribed tolls were levied upon the Dutch, an attempt to increase which a century afterwards resulted in war. In the seventeenth century England and France contracted to pay the same Sound Dues that the Dutch paid. This continued until about 1855, when an arrangement was made whereby, on the payment of 35 million rix-dollars (about \$17,500,000), Denmark relinquished her claim to tolls, and agreed to properly police and protect the passage. The United States' share of the capitalized tariff was \$393,011. Previous to Russia's acquisition of the northern coast of the Black Sea it was Turkish water, but by the Treaty of Adrianople (1829) entrance through the straits into the Black Sea and navigation thereon was permitted to Russia and Powers friendly to her. But according to the ancient custom all foreign vessels of war had been prohibited from entering the Bosphorus and the Dardanelles, and this inhibition was continued under the Treaty of London (1841) between Turkey and the five Powers. By the Treaty of Paris of 1856 the Black Sea was neutralized, but in 1871 Russia secured the abrogation of this provision of the treaty and has the right of maintaining her fleets of whatever size in the Black Sea. Turkey may in time of peace lawfully open the straits to her friends, although unfriendly to

Russia, whenever it may seem necessary to provide for her own safety.

When a navigable river runs between two States both are guaranteed its unmolested use and the line is held to run along the middle of the stream. But when a river rises in the territory of one State and discharges through the territory of another, international law does not admit the moral claim sometimes asserted by the upper State to right of navigation to the mouth. Yet nearly all such streams flowing through the territory of Christian nations have now been opened by international agreement. By the act of the Congress of Vienna (1815) declaring free the use of certain streams separating or traversing the territory of different Powers, the Rhine and Scheldt were opened to navigation. This act also opened most of the other European rivers, excepting the Danube, which by the Treaty of Bucharest and later by that of Adrianople (1829) was made free for common commercial use to Turkey and Russia. Later by the Treaty of Paris (1856) this also came within the application of the concert of the Congress of Vienna. At the close of the Revolutionary War Spain held the territory at the mouth of the Mississippi and refused the United States outlet to the Gulf of Mexico. The Louisiana Territory was subsequently ceded to France, and its purchase by the United States in 1803 removed the question. The Saint Lawrence was thrown open to the United States by the reciprocity treaty of 1854 with Great Britain, which also included the reciprocal use of the Upper Lakes and the freedom of Lake Michigan to Canadian subjects. In South America the freedom of the Rio de la Plata to commerce was guaranteed by a series of treaties from 1853 to 1859; while the Amazon was in 1867 declared by Brazil to be open to all nations. The Stikine, Yukon, and Porcupine rivers of Alaska, rising in British territory, were opened to the subjects of England and the United States by the Treaty of Washington (1871), while the Congo and Niger in Africa were opened under an agreement for an international commission provided for by the Congo Conference of 1884-85. Consult the authorities referred to under *INTERNATIONAL LAW*. See also *HIGH SEAS*.

NAVIGATION ACT. The name applied to each of a series of acts, known collectively as 'The Navigation Acts,' passed by the English Parliament, beginning with 1645, for the purpose of protecting the shipping of Great Britain and her colonies, of injuring the shipping of the Dutch, the chief rivals of the English, and of exploiting, for the benefit of England, the commerce of the English colonies. See *NAVIGATION LAWS*.

NAVIGATION LAWS. The early restriction placed upon commerce was but one phase of the application of the economic doctrines advocated prior to the time of Adam Smith, prohibiting exports, regulating intercourse, and generally obstructing the operation of economic laws. The first recorded British navigation law belongs to the reign of Richard II. (1381), and required the shipment of merchandise by the "King's liege people" in "ships of the King's liegance." Subsequently a more liberal policy was pursued. With the discovery of the New World and the consequent growth of colonial dependencies, both the importance of navigation laws as a question of

policy and their sphere of influence were greatly extended. England, France, Spain, Portugal, and Holland by their restrictions prohibited all commercial intercourse between their colonies and other nations; and Spain even treated the crews of foreign ships wrecked upon her coasts as pirates. In 1645 the English Parliament passed an act prohibiting the importation into England of whale oil and other products of the whale fisheries, in any vessels except such as were owned in England and were manned by English seamen. This act was the first of a long series of acts which are known collectively in history as "The Navigation Acts." The acts of 1651 and 1660—the latter of which is known officially as "The First Navigation Act"—served as the basis of the British legislation in this field for almost two hundred years. In general, the objects of these acts, as of the succeeding ones, were to protect the shipping of England and her colonies, and to exploit the trade of the colonies in the interest of the mother country. The chief feature of the acts of 1651 and 1660 was the prohibition of the importation into England of foreign products except in English ships or in the ships of the country of production. In 1663, by what is usually known as the 'Second Navigation Act,' it was ordered that "none of the products of the English plantations or factories . . . in Asia, Africa, or America shall be carried anywhere (except to other plantations) till they be first landed in England, under the forfeiture of ships and cargoes." The English restrictive measures neither destroyed the Dutch commerce of the seventeenth century nor stamped out American shipping interests of the eighteenth. The Lloyd's register of 1775 returned for the three years next preceeding, 2311 vessels of American build as against 3908 of British construction. The chief features of the British Navigation Code, which was essentially identical with that of all maritime nations, as it existed down to the time of its repeal in 1849, required: That no foreigner could own, wholly or in part, an English ship; the captain and three-fourths of the crew must be British subjects; foreign products must be imported in British ships or in ships of the country of production; products of Asia, Africa, and America could not be imported into Great Britain from any European port in any ship whatsoever, and such products could be imported from any other place only in British ships or those of the country of production. No coastwise trade was permitted in foreign ships to the United Kingdom or between different British possessions, and trade of any kind was permitted only by special authorization. The effort to evade these restrictions involved great waste of capital, while the adoption of a more liberal policy has resulted in no diminution of the prosperity of the British Merchant Marine.

The American navigation policy began with the treaty of commerce entered into with France in 1778, which included a provision to take as the "basis of their agreement the most perfect equality and reciprocity." But the liberal tone of this instrument was discontinued when, under the influence of the New England representatives the framers of the Constitution in 1789 gave to Congress an unrestricted power to enact navigation laws (U. S. Con., Art. I., § viii., clause 3). In 1789-92 the foundation of the American system

was laid by the levying of tonnage dues and import taxes after the English custom so drastic in nature as to give American shipments a practical monopoly of American commerce. This was followed by a registration act (1792) and the closing of the coasting trade to foreign shipping in 1793. After the close of the War of 1812 the two countries somewhat modified their attitude toward each other, and a treaty was entered into placing their ships upon a reciprocal footing in the ports of the United States and Great Britain and suspending somewhat the discriminating duties charged upon the goods carried. This tendency gradually resulted in England in the Reciprocity Acts of 1824 and the final repeal of her navigation laws.

The American system continued practically unchanged. In addition to those already stated, some of its more vexatious provisions which prevailed for three-quarters of the nineteenth century forbade or restricted the registration of foreign-built or foreign-owned vessels, the repair of vessels abroad, without payment of duty on materials used in repairs, or foreign vessels in the United States, without duty on entry of repairs, and compelled all vessels to first report at a port of entry and conform to the customs regulations before they could proceed to the port of delivery to discharge their cargoes; and foreign vessels could discharge only at the port of entry.

Meanwhile, American shipping had undergone various changes consonant with the economic forces in operation during this period. From 1815 to 1842 with an abundant natural supply of building material coupled with American ingenuity, it increased 70 per cent., but with the change from wooden to iron vessels, this advantage was shifted in England's favor and during the period following the Civil War the depression in freight rates and the more lucrative opportunity furnished for the investment of American capital in other directions resulted in the decrease of the American merchant marine. The decrease was also accentuated by the law forbidding any but American-built vessels to carry the American flag. The changed conditions of the past decade, however, and the modification of the statutory restrictions—by an act of 1892 foreign-built vessels of 8000 tons burden, and a speed of twenty knots an hour, which are owned in a certain part by Americans, can fly the American flag—have invigorated ship-building and shipping interests generally in the United States.

Under the provisions of the act of 1884 owners can now fill vacancies in the positions of officers below captain by aliens when in foreign voyages; seamen can be discharged at foreign ports on mutual application of master and seaman without payment of additional wages; seamen are allowed only one month's pay in case of injury to the vessel; consular fees for services to vessels and seamen are paid by the United States Treasury. Ship-building is encouraged by permitting a drawback on imported materials equal in amount to the duty paid, if the vessel is built for export. Vessels must now have the port of registry, or the place where the owner resides, if in the same district, painted upon their sterns. Vessels in trade with contiguous foreign territory no longer are required to pay a capitation tax on passengers, thus putting vessels trading with

Canada and Mexico on equal terms with the railroads, and more liberal mail laws have been passed. By the act of 1888 the tonnage rates were reduced to 3 cents per ton, not to exceed 15 cents per ton per year in the aggregate on each entry of all vessels from any foreign port in North America, Central America, the West Indies, Bahamas or Bermudas, and a rate of 6 cents not to exceed 30 cents upon all vessels entering from foreign ports, the President being authorized to suspend this duty so far as it was in excess of tonnage and other duties imposed by the country of their home port. The further act limiting the liability of ship-owners for the ship's debts, excepting wages, to the amount of his interest has proved a great benefit. The United States Shipping Commissioners were established by the act of 1872, and later, by the act of 1884, were placed under the control of the Treasury Department, as was the Bureau of Navigation, established in that year.

NAVIGATORS' ISLANDS. See SAMOAN ISLANDS.

NAVILLE, ná'vél', EDOUARD HENRI (1844—). A Swiss Egyptologist, born at Geneva, June 14, 1844. He studied at the university of his native city, King's College, London (1862), Bonn (1866), and at the Faculté des Lettres, Paris, receiving his degree in 1867. During his university career he paid much attention to Egyptology, and in 1868 he followed the courses of Lepsius at Berlin. The following year he went to Egypt, and in 1870 he published as the result of his investigations there his work, *Textes relatifs au mythe d'Horus recueillis dans le temple d'Edfou* (Geneva). His *La litanie du soleil* appeared in 1875, and his *Inscription historique de Pinodjem III.* was published at Paris in 1883. In 1874 Naville was commissioned by the London Congress of Orientalists to edit the text of the *Egyptian Book of the Dead* (q.v.). Naville spent the next ten years collecting material in the libraries and museums of Europe. The results of his labors appeared in *Das ägyptische Totenbuch der 18. bis 20. Dynastie* (1886), one of the most important works in the history of Egyptology. Beginning in 1882, Naville usually spent his winters in Egypt conducting investigations for the Egypt Exploration Fund, and his work in this direction produced most valuable results. In 1891 he became professor of Egyptology in the University of Geneva. Among the most important of Naville's works, in addition to those already mentioned, are: *The Store City of Pithom and the Route of the Exodus*, Egypt Exploration Fund Memoir i. (1885); *Goshen and the Shrine of Saft el Henneh*, Egypt Exploration Fund Memoir iv. (1887); *The Festival Hall of Osorkou II.*, Egypt Exploration Fund Memoir x. (1892); *Ahnas el Medineh*, Egypt Exploration Fund Memoir xi. (1894); *Deir el Bahari*, Egypt Exploration Fund Memoirs xii., xiii., xiv., xvi., xix. (1894-1901).

NAVY, DEPARTMENT OF THE. One of the nine executive departments of the United States Government, created by act of Congress of April 30, 1798, and charged with the general control and administration of the navy. From 1789 to 1798 the management of naval affairs was under the control of the War Department. At the head of the department is a secretary, who is a member of the Cabinet, appointed by the President with

the advice and consent of the Senate, and receives an annual salary of \$8000. As the President is by the Constitution the commander-in-chief of the navy, the Secretary is generally subject to his direction. It is his duty to execute such orders as the President may give relative to the administration of naval affairs, including the procurement of naval supplies and the construction, armament, equipment, and employment of vessels of war. A variety of specific duties are imposed upon him by law, in which cases he is not subject to the direction of the President. He makes annual report to the President of the operations of the Navy Department. His deputy is the Assistant Secretary, who is appointed by the President, and who during the absence or incapacitation of the Secretary acts in his stead, taking the title of acting Secretary. An act of June 8, 1880, authorized the appointment of a judge-advocate-general of the navy from the marine corps or the navy with the rank of colonel or captain. It is his duty to receive, revise, and record the proceedings of courts-martial, courts of inquiry, boards for the examination of officers for retirement and promotion in the naval service, and to give opinions on such legal questions as arise in the course of the administration of the navy. Another officer of importance attached to the Navy Department is the commandant of the marine corps.

By an act of July 5, 1862, eight bureaus were established in the Navy Department, at the head of each being a chief, appointed by the President from among the officers of the navy. These are, the bureaus of (1) Yards and Docks; (2) Equipment; (3) Navigation; (4) Ordnance; (5) Construction and Repair; (6) Steam Engineering; (7) Medicine and Surgery; and (8) Supplies and Accounts. See *Navy*, under UNITED STATES.

NAVY REGISTER. An annual official publication of the United States Navy Department. It gives a list of the officers of the navy and marine corps in order of their rank, a list of retired officers, a statement of resignations, retirements, dismissals, and deaths since the publication of the previous register, the number of stations with the ships on each and the names of officers attached to them, and an enumeration of the ships of the navy, with some details of their character, present condition, and service.

NAVY YARD. The principal navy yard of the United States is located at Brooklyn, N. Y., on the East River. There are three dry docks at this yard and one under construction. Here also is located the naval clothing factory which makes the uniforms for the enlisted men. The other important navy yards of the United States are at Norfolk (Va.), League Island (near Philadelphia), Boston, Mare Island (San Francisco Bay), and Port Orchard (Puget Sound); there are less important yards at Portsmouth (N. H.) and Pensacola (Fla.), and a yard of considerable importance is being developed at Charleston, S. C. In England the term dockyard (see DOCKYARDS, ROYAL) is equivalent to the American designation navy yard. The great naval establishments on the Continent of Europe are generally termed arsenals (q.v.).

NAWANAGAR, nū-wā'nū-gūr'. A seaport of India. See NOWANAGAR.

NAX'OS (Lat., from Gk. Νάξος). The largest, most beautiful, and most fertile of the Cyclades.

It is situated in the *Ægean*, midway between the coasts of Greece and Asia Minor. Extreme length, about 20 miles; breadth, 15 miles. Population, in 1896, 15,608. The principal products and articles of export are wine, corn, oil, cotton, fruits, and emery. The wine of Naxos (the best variety of which is still called in the islands of the *Ægean* *Bacchus wine*) was famous in ancient as it is in modern times, and on this account the island was celebrated in the legends of Dionysus and Ariadne. The island also contains good quarries of marble of a rather coarser grain than that of Paros. They were worked in the sixth century B.C., as is proved by the unfinished statues found in them, among which is a famous colossus, some 34 feet in length. The most flourishing period in the history of the island seems to have been in the sixth century B.C. under the rule of the tyrant Lygdamis. In B.C. 490 it was ravaged by Persians, and later joined the Delian League, from which (B.C. 469) it was the first to revolt. The island now became a dependency of Athens. After the conquest of Constantinople by the Latins, it became in 1207 the seat of a dukedom, founded by the Venetians, and in 1586 was seized by the Turks. It now forms a portion of the Kingdom of Greece (q.v.). Naxos, the capital, with a population of 2000, is situated on the northwest coast, contains Greek and Catholic churches, and a castle built by the Venetians, and is the seat of a Greek and a Latin bishop. Consult: Ross, *Reisen auf den Inseln des Ägäischen Meeres*, i. (Halle, 1840); Tozer, *Islands of the Ægean* (Oxford, 1890); Curtius, *Naxos* (Berlin, 1846); Duget, *De Insula Naxo* (Paris, 1867).

NAYLER, JAMES (c.1617-60). An English Quaker. He was born at Ardsley, in Yorkshire. In 1642 he became an adherent of the Parliament, and served for about eight years under Fairfax and Lambert. While in the army he began to preach as an independent, but in 1651 was led by George Fox to become a Quaker, and for three years was Fox's literary coadjutor. But popularity, especially with women, turned his head. His followers fancied that he resembled the pictures of Christ, and they called him 'Jesus' and the 'Lamb of God.' He was arrested on charges of blasphemy, tried before Parliament, and sentenced to the pillory, whipping, branding, and imprisonment for two years. The whole punishment was inflicted. He was released in 1659, recanted his errors, and was again received by the Society of Quakers. A collection of his writings was published in London in 1716, and his *Memoirs* in 1719 and reprinted in 1800.

NAZARENE (Gk. *Ναζαρηός*, *Nazarēnos*, more frequently *Ναζωραῖος*, *Nazōraios*, from *Ναζαρέ*, *Nazara*, *Ναζαρέθ*, *Nazareth*, *Nazareth*). A term applied to Jesus to indicate that He came from the somewhat obscure Galilean town Nazareth (q.v.), which was not connected with any Messianic prophecies or expectations (cf. John i. 46 and vii. 41). 'Jesus the Nazarene' (i.e. 'Jesus of Nazareth') became a popular term used by friend and enemy alike (quite frequently in the Gospels and Acts). When the Gospel of Matthew was written the term was considered a fulfillment of Isa. xi. 1. (Matt. ii. 23). It was thus an easy transition for the Jews to speak of the

early Christians as the sect of Nazarenes (Acts xxiv. 5). Throughout the obscure and checkered development of Jewish Christianity the name was preserved, until in the fourth century 'Nazarenes' meant those Jewish Christians who, unlike the Ebionites (q.v.), were quite loyal to Jesus' teachings and not strongly anti-Gentile in their sentiments. Their general traditions and usages were, however, more Jewish than Christian. They had a Gospel of their own, made no use of Paul's Epistles, and were looked upon unfavorably by many orthodox Christians. While the Ebionites, however, grew ever more bitter toward Catholic Christianity, these seem to have gradually become lost in the greater Gentile Church. Their Gospel, known to us mainly through Jerome, was probably the same as that called by other writers the Gospel of the Hebrews, and was in existence as early as 150. All the evidence indicates that it was a secondary form of Matthew, with certain additions and variations. The work was by no means heretical in its tendencies. Later writers, from the fourth century onward, were inclined to class it as apocryphal, probably on account of the differences between it and the canonical Matthew, and also because there was no place for a fifth Gospel. The Gospel used by the more bigoted Jewish-Christian sect of Ebionites was not identical with the Nazarene Gospel, but a secondary form of the Greek Matthew. Consult: Zahn, *Geschichte des neutestamentlichen Kanons*, ii. 2 (Leipzig, 1892); Nicholson, *Gospel of the Hebrews* (London, 1879); Resch, *Agapha* (Leipzig, 1889); Kruger, *History of Early Christian Literature* (New York, 1897).

NAZARENES, or NAZARITES. A group of German painters. See PRE-RAPHAELITES.

NAZARETH (Gk. *Ναζαρέθ*, *Nazareth*, *Ναζαρέ*, *Nazara*, from an Aramaic word of uncertain form and meaning). A town of ancient Galilee, famed as the place where Jesus passed His childhood. The New Testament records are singularly silent as to the details of the life of the Holy Family in Nazareth. The only passage giving any light is Matt. xiii. 54-58 (= Mark vi. 1-5, Luke iv. 16-30), the record of a visit by Jesus after He had begun His public ministry. From the question of Nathanael (John i. 46) it may be inferred that it was a place of no special importance, but not necessarily that it had a bad reputation. Since the town is not mentioned in the Old Testament or Josephus, we are entirely ignorant of its early history. The New Testament writings and the Talmud only show that Jesus was popularly called, perhaps at first in contempt, 'the Nazarene,' and His followers 'Nazarenes.' (See NAZARENE.) No further mention is found until Eusebius, who says in his *Onomasticon* that it was fifteen Roman miles eastward from Legeon (the ancient Megiddo), and not far from Mount Tabor. Epiphanius, a century later, says that it had become in his day a mere village. The Christians of the first three centuries appear to have regarded it with no consideration. In later centuries it began to attract pilgrims. It naturally was revered by the Crusaders, who greatly embellished the place. After its final capture by the Moslems in 1291 it declined, though retaining its attraction for pilgrims. About 1620 a great Franciscan church and convent of the Annunciation was built. This has become one of the most

popular pilgrim shrines in Palestine. The house in which Mary lived is said to have been miraculously transported to Loreto (q.v.), Italy. Of late years Nazareth has materially increased in population, at present containing over 10,000 souls, of whom nearly 8000 are Christians. The situation is most beautiful. In the upper reaches of a valley leading down to the Plain of Esdraelon to the south, shut in by hills, with a very fertile soil, it is isolated from the world. It is only necessary to climb the hills, however, to gain one of the finest views in Palestine. The modern town, mainly on the steep slopes of the southwest side of the valley or basin, is probably farther from the summit of the hill than was the ancient town of Jesus' day. Of all the 'holy places' in Palestine few can rival the spring near the Greek Church of Gabriel, a spot probably often visited by Mary and Jesus. Consult: Stanley, *Sinai and Palestine* (New York, 1883); George Adam Smith, *Historical Geography of the Holy Land* (New York, 1896); Baedeker-Socin, *Palestine and Syria* (Leipzig, 1898), with a plan of the town and description of the antiquities; Ritter, *Erdkunde*, vol. xvi. (Berlin, 1852); Guérin, *Galilée* (Paris, 1880); Buhl, *Geographie Palästinas* (Freiburg, 1896).

NAZARITE. See NAZIRITE.

NAZARITES (from Lat. *Nazarita*, from Gk. *Ναζαρητις*, *Nazaritis*, from Heb. *nāzar*, to separate oneself). A Christian sect found in Hungary, and particularly numerous in the Magyar districts of Eastern Hungary. They believe in the Trinity, but reject transubstantiation and infant baptism. They have no priesthood, refuse to take oaths, to perform military service, or participate in politics, and have given the Government much trouble.

NAZIRITE (Heb. *nāzir*, from *nāzar*, to consecrate). Among the Hebrews, one who had devoted himself in a peculiar sense to Yahweh. The term is used of two classes: (a) Nazirites for life, and (b) Nazirites for a limited period. The law in the post-exilic Priestly Code (Num. vi.) refers to the latter class alone. According to this law, one who had taken the vow of Naziriteship was to abstain from wine or any intoxicating drink, not to suffer a razor to touch his head, but to let the locks of his hair grow long, and to avoid all ceremonial defilement. It is evident from these regulations—particularly the first two—that the Nazirite was to lead a life marked by the return to the simpler and rougher fashions of primitive times. The original purpose of such vows among the Hebrews, as among the Arabs, where they are also found (cf. Wellhausen, *Reste arabischen Heidenthums*, p. 143, Berlin, 1897; W. R. Smith, *Religion of the Semites*, pp. 482 sqq., London, 1894), was for war or revenge, but it was natural also to extend the customs involved to sacred seasons of the year when the deity was to be approached. So among the Arabs to this day, during the days spent by the pilgrims in Mecca (see HAJJ), it is forbidden to cut the hair, and other restrictions are imposed, most of which emphasize the return in the holy season to more primitive fashions. As for the Nazirite for life, we have only two instances in the Old Testament, Samson and Samuel. The former, in so far as he embodies popular elements, represents the hero of a rude age. It is not said of him that he was

to abstain from wine, and, as a matter of fact, he frequently was involved in acts (such as contact with the carcass of a lion) which brought in their wake ceremonial defilement. The long hair in his case may have originally been the natural condition, just as the hero Eabani among the Babylonians is described as 'hairy.' In the case of Samuel, the Naziriteship involves, likewise, merely the obligation to let the hair grow, and this may have been customary among the guardians of the sanctuaries, who were in a perpetual state of 'sanctity.' The application, therefore, of the term Nazirite to Samson and Samuel in the post-exilic sense of the word is due to the projection into the past of a condition which reached its development centuries after the age of these two personages. Naziriteship in time lost its old significance and became a species of private asceticism. In this sense, John the Baptist is a 'permanent' Nazirite (Luke i. 15) and Saint Paul possibly (though not certainly) a temporary one (Acts xxi. 17-26). Consult: Dillmann, *Die Bücher Numeri, Deuteronomium und Josua* (Leipzig, 1886); Driver, "The Books of Joel and Amos," in the *Cambridge Bible for Schools and Colleges* (Cambridge, 1897); Nowack, *Hebräische Archäologie* (Freiburg, 1894); Benzinger, *Hebräische Archäologie* (ib., 1894); Smend, *Lehrbuch der alttestamentlichen Religionsgeschichte* (ib., 1893).

NEERA (Lat., from Gk. *Νεαῖρα*, *Neaira*). The name of several nymphs in Grecian mythology, and of a maiden mentioned in the poems of Horace, Vergil, and Tibullus. It is used also in Milton's *Lycidas*, to designate an imaginary charmer.

NEAGH, *nā*, *Ir. pron. nā'āg*, LOUGH. The largest lake of the British Isles, in the north-eastern part of Ireland, 13 miles west of Belfast (Map: Ireland, E 2). It is rectangular in shape, 17 miles long by 10 miles wide, and has a mean depth of 40 feet. It is drained northward into the Atlantic Ocean through the Bann River. Canals connect it with Belfast on the east and Lough Erne on the southwest.

NEAGLE, *nā'g'l*, JOHN (1796-1865). An American portrait painter. He was born in Boston, November 4, 1796, but his parents moved to Philadelphia soon after his birth. He was practically self-taught. About 1818 he began painting portraits in Lexington, Ky., and later practiced in other cities. On his return to Philadelphia, he married the daughter of Thomas Sully, the painter, from whom he received instruction and encouragement. He made rapid progress and rose in public favor, was made director of the Pennsylvania Academy (1830-31), and first president of the Artists' Fund Society of Philadelphia (1835-44). Neagle was a good draughtsman and colorist, and clever in delineation of character. Most of his important works are in Philadelphia, and include a full-length portrait of Patrick Lyon at the Forge (1826), Pennsylvania Academy; portraits of Rev. Dr. Joseph Pilmore, Saint George's Hall; Henry Clay, Union League Club; Dr. Thomas Parke, City Library; and George Washington, Independence Hall. Other works are a portrait of Gilbert Stuart, Athenæum, Boston, and several Indian portraits, New York Historical Society.

NEAL, DANIEL (1678-1743). The historian of the Puritans, born in London. He entered Ox-

ford, but left before completing the course, to study for the dissenting ministry in England and Holland. In 1703 he returned to England, in 1706 became pastor of an independent congregation in Aldersgate Street, London, and remained at its head to the end of his life. His first work, a *History of New England* (1720), won for him the honorary degree of master of arts from Harvard in 1721. Neal's greatest work, however, was the *History of the Puritans* from the Reformation to 1689, originally undertaken by him in conjunction with Dr. John Evans. Dr. Evans died in 1730, and Neal completed the work himself (1732-38). The work was, on the whole, very favorably received by the Puritans, but Neal's studied misrepresentation and suppression of facts evoked criticism. Nevertheless, the history is for the most part a scholarly piece of work.

NEAL, DAVID DALHOFF (1838—). An American painter. He was born at Lowell, Mass., October 20, 1838, and after studying in New Orleans, La., went to San Francisco, where he was employed in making drawings on wood. In 1862 he went to Europe, and entered the schools of the Royal Bavarian Academy, Munich. In the following year he married the daughter of Chevalier Maximilian Ainmüller, and began his first regular lessons in oil painting with his father-in-law, devoting himself to architectural subjects. From 1869 to 1876 he studied figure painting under Alexander Wagner and under Piloty. After 1879 he principally practiced portrait painting. Among the works in his early style are the "Chapel of Nonberg, Salzburg" (1864); "Chapel of the Kings, Westminster;" and "Saint Mark's." His first figure composition, "James Watt," was exhibited at the Royal Academy, London (1873). The "First Meeting of Mary Stuart and Rizzio" (1875) received the great medal from the Royal Bavarian Academy. His most noted work, "Oliver Cromwell and John Milton," is now in the Public Library, Cleveland, Ohio. His portraits owe their success to their good characterization. A fair example is that of Rev. Mark Hopkins for Williams College.

NEAL, JOHN (1793-1876). An American poet and novelist of English-Quaker descent, born in Portland, Maine. Neal was self-educated, and studied law at Baltimore, supporting himself by literary work with an energy that characterized him throughout his long and varied life. Between 1817 and 1819 he published *Keep Cool*, a novel in two volumes, two volumes of verse, and a five-act tragedy, *Otho*. Meantime he was admitted to the Maryland bar. In 1823 he paid a visit to England. Here he was a pioneer of American letters, attracting and compelling attention, the first American to contribute to the great quarterlies and to *Blackwood*, and becoming secretary of Jeremy Bentham. Returning to America in 1827, he took up the practice of law in Portland, and in 1828 began to edit the *Yankee*, contributing much to various other magazines and newspapers, earnestly opposing capital punishment, and being an early advocate of woman's suffrage. He established a gymnasium, said to have been the first in the United States, and he was himself skilled in all the arts of exercise, and a sympathetic teacher and adviser of young men, notable among whom was E. A. Poe. While engaged energetically in journalism, he

poured out a steady stream of novels, interspersed with other works. The more noteworthy of his chaotic, Byronic novels are *Randolph* (1823) and *Logan* (1823); *Rachel Dyer* (1828) and *The Downeasters* (1833) are soberer but not memorable productions. The interesting autobiography, *Wandering Recollections of a Somewhat Busy Life* (1869), was practically the last of his voluminous writings, all of which are characterized by haste, but not less by an ebullient genius and distinctive nationality.

NEAL, JOSEPH CLAY (1807-47). An American humorist, born at Greenland, N. H. He settled in Philadelphia, where in 1831 he became editor of the *Pennsylvanian*, a Democratic journal. In 1844 he founded the *Saturday Gazette*, which had a large circulation. His best-known book, *Charcoal Sketches; or, Scenes in a Metropolis* (1837; second series 1849), enjoyed a considerable degree of popularity, and was republished in London. He wrote also *Peter Ploddy and Other Oddities* (1844).

NEALE, nel, EDWARD VANSITTART (1810-92). An English Christian Socialist, born at Bath and educated at Oriel College, Oxford. He became an advocate of social reform, and joined the group of Christian Socialists under F. D. Maurice. Neale founded the first coöperative stores in London. He assisted in forming several industrial societies, was a founder of the Cobden Mills in 1866, and of the Agricultural and Horticultural Association in 1867, and general secretary to the Central Coöperative Board from 1875 until 1891. He visited America in 1875. He was a director of the Coöperative Insurance Company and of the Coöperative Newspaper Society, and a Vansittart Neale scholarship at Oriel College for the sons of coöperatives was founded in his honor in 1890. His writings include: *The Characteristic Features of Some of the Principal Systems of Socialism* (1851); *The Mythical Element in Christianity* (1873); and *A Manual for Coöperators* (1879).

NEALE, JOHN MASON (1818-66). An English author and hymnologist, born in London. He graduated at Trinity College, Cambridge, in 1840, and took holy orders in the Church of England. While chaplain and tutor at Downing College, he warmly embraced high-church views and adhered to his principles in spite of severe criticism. He was for many years warden of Sackville College, East Grinstead, and was the founder of an Anglican sisterhood of Saint Margaret. His extensive writings on theological and ecclesiastical subjects include *A History of the So-called Jansenist Church in Holland* (1858) and *Mediæval Preachers* (1857). He translated the several parts of Bernard of Cluny's *De Contemptu Mundi*, "Jerusalem the Golden," and in 1863 published *Hymns of the Eastern Church*. He also published, in addition to various collections of hymns: a *History of the Jews* (1841); *An Introduction to the History of the Holy Eastern Church* (1850); *Stories for Children from Church History* (1850); *Theodore Phranza, or the Fall of Constantinople* (1857); *History of the Council of Florence* (1861); and *Essays on Liturgiology and Church History* (1863).

NEANDER, na-än'dër, JOHANN AUGUST WILHELM (1789-1850). One of the most famous of ecclesiastical historians. He was born at Göt-

tingen, January 17, 1789, of Jewish parentage, and received his early education at the Johanneum in Hamburg. On February 15, 1806, he publicly renounced Judaism, and was baptized in Saint Catharine's Church, Hamburg, changing his name from David Mendel to Neander (from Greek *neos*, *neos*, new + *andros*, *anēr*, man, in allusion to the religious change which he had experienced) and taking his Christian names from several of his friends. He now proceeded to Halle, where he studied theology under Schleiermacher, and concluded his academic course at his native town of Göttingen. In 1811 he took up his residence at Heidelberg University as a privat-docent; in 1812 he was appointed extraordinary professor of theology; and in the following year was called to the newly established University of Berlin as professor of Church history. Here he labored till his death, July 14, 1850. Neander enjoyed great celebrity as a lecturer. Students flocked to him, not only from all parts of Germany, but from the most distant Protestant countries. His works, in the order of time, are: *Ueber den Kaiser Julianus und sein Zeitalter* (1812); *Der heilige Bernhard, und sein Zeitalter* (1813); *Genetische Entwicklung der vornehmsten gnostischen Systeme* (1818); *Der heilige Johannes Chrysostomus und die Kirche, besonders des Orients, in dessen Zeitalter* (1821-22); *Denkwürdigkeiten aus der Geschichte des Christenthums und des christlichen Lebens* (1822-24); *Antignosticus, Geist des Tertullianus und Einleitung in dessen Schriften* (1826); *Allgemeine Geschichte der christlichen Religion und Kirche* (1825-52); *Kleine Gelegenheitsschriften* (1824); *Geschichte der Pflanzung und Leitung der christlichen Kirche durch die Apostel* (1832-33); *Das Leben Jesu Christi in seinem geschichtlichen Zusammenhange*, written as a reply to Strauss's work (1837); *Wissenschaftliche Abhandlungen*, published by Jacobi (1851); *Geschichte der christlichen Dogmen*, also published by Jacobi (1856); and several other posthumous works. The majority of these works have been translated into English, viz., *General History of the Christian Religion and Church* (trans. by Torrey, 12th ed. 1882); *History of the Planting and Training of the Christian Church by the Apostles* (trans. by Ryland, 1842); *Memorials of Christian Life in the Early and Middle Ages* (trans. by Ryland, 1832); *Life and Times of Saint Bernard* (trans. by Miss Matilde Wrench, 1843); *Life of Chrysostom* (trans. by Stapleton, 1845); *Life of Jesus Christ* (trans. by McClintock and Blumenthal, 1848); *Lectures on the History of Christian Dogmas* (trans. by Ryland, 1858); *The Emperor Julian* (trans. by Cox, 1850); and his commentaries on Philippians, James, and First John. Consult his *Life* by Philip Schaff (New York, 1886); by Wiegand, with bibliography (Erfurt, 1890); and by Schneider (Schleswig, 1894).

NEANDERTHAL (nā-ān'dēr-tāl) MAN.

The name applied to a dolichocephalic early Quaternary type in Western Europe, based on the upper portion of a human skull found 60 feet beneath the surface by quarrymen in a ravine called Neanderthal, near the village of Hochdal, between Düsseldorf and Elberfeld, in Rhenish Prussia. Anthropologists have varied greatly in their judgment of this relic. The preponderance of opinion is toward the view that the Neander-

thal skull represents the oldest known dolichocephalic folk of Europe. Crania of the Neanderthal type were subsequently found at Brux (Bohemia), Podbaba (near Prague, Bohemia), Eguisheim (near Kolmar, Alsace), Denise (near Le Puy, Haute-Loire), Marcilly (Eure, France), Bréchamps (Eure-et-Loir), Tilbury (England, near London), Bury-Saint-Edmunds (Suffolk, England), and Victoria Cave Galley Hill, Hamilton (England). This type, in addition to its low cranial index (70-75.3), was characterized by a low forehead, prominent brow ridges, and low stature (about 1.59 meters, or 62.5 inches).

NEAPOLIS (Lat., from Gk. *Néapolis*, 'new town'). An ancient town, the seaport of Philippi in Macedonia. The modern town of Kavalla (Map: Balkan Peninsula, E 4), with about 5000 inhabitants, is on or near its site. Paul landed here when he sailed from Troas to begin his missionary labors in Europe (Acts xvi. 9-11). The town lay on a bay, which afforded excellent anchorage, nearly opposite the island of Thasos, and was distant about nine miles from Philippi.

NEAPOLIS. The ancient name of Naples (q.v.).

NEAP-TIDES. See TIDES.

NEARCHUS, nē-ār'kūs (Lat., from Gk. *Néarchos*, *Nearchos*). The commander of the fleet of Alexander the Great in his Indian expedition (B.C. 327-326). He was the son of Androtimus, and was born in Crete, but settled in Amphipolis in Macedonia, near the Thracian boundary. He was high in favor with Philip, but was banished on account of his adherence to Alexander. When, however, Alexander succeeded to the throne of Macedon, Nearchus was recalled, and when the conquest of the Persian Empire was begun, he was appointed Governor of Lycia and other districts in the south of Asia Minor. In B.C. 329 he accompanied Alexander to Bactria, with a body of Greek mercenaries. When his patron ordered a fleet to be built on the Hydaspes, Nearchus received the command of it. He sailed down the Indus, and then to the Persian Gulf, and arrived at Susa, in Persia, February 24, 324, shortly after Alexander himself, who had marched overland. After the death of Alexander Nearchus accepted the decision of the other generals with regard to the position of the kingdom, and retained his own provinces under Antigonos, whom he accompanied against Eumenes. In 314 Antigonos appointed him a counselor of his son, Demetrius. Fragments of his narrative of his voyage have been preserved in the *Indica* of Arrian. Consult McCrindle, *Invasion of India by Alexander the Great* (Westminster, 1896).

NEARCTIC REGION (from Gk. *neos*, *neos*, new + *arktos*, *arktikos*, arctic, northern). A region in zoögeography including the entire continent of North America, except the hot coastlands of Mexico. It is a part of Arctogea, or the Holarctic Region, in the view of those who regard the Northern Hemisphere as a unit in zoögeography; but in the scheme of Sclater and Wallace it is one of the six primary regions, co-ordinate with the Palearctic Province. (See DISTRIBUTION OF ANIMALS, *Zoögeographical Map*.) Of further interest here are the subdivisions or local faunal areas that have been distinguished.

The earliest attempt at this set apart three regions—an 'Eastern,' from the Atlantic to the plains; a 'Central,' including the dry interior plains; and a 'Western,' the Pacific Slope. As early as 1854 Louis Agassiz stated that the eastern half of the continent contained three faunas: a northern, which he called 'Canadian'; a middle (Great Lakes to the latitude of Kentucky), which he called 'Alleghanian'; and a southern or 'Louisianian.' Later writers, especially Allen, dealing mainly with birds, made eight zones in succession from north to south—Arctic, Hudsonian, Canadian, Alleghanian, Carolinian, Louisianian, Floridian, and Antillean. Ornithologists still use this classification east of the Mississippi River. Subsequently Merriam announced the opinion that there was no reason for recognizing a 'Central Province,' and that too much stress had been laid upon the dissimilarities between Eastern and Western animals. He asserted the view that only two primary subdivisions of the Nearctic Region should be made—a 'Boreal' province and a 'Sonoran' province. The former stretches from New England and the Great Lakes northwest across Canada to Alaska, and sends down long arms along the heights of the Alleghanies and the Rocky Mountains, and along the Pacific Coast, whose fauna is a mingled one. Everything south of this is 'Sonoran,' embracing nearly all the United States, a great area of the plains of Northwestern Canada, and all of Mexico except the low tropical coast-lands. These generalizations, however, have not been universally accepted, most critics objecting that too high rank has been accorded to the 'Sonoran' region, whose boundaries are regarded as too indefinite to entitle it to be differentiated and outlined as Merriam proposed in his "Biological Survey of the San Francisco Mountain Region," in *North American Fauna*, No. 3 (Washington, 1890). The question of the subdivision of the Nearctic Region therefore remains open.

NEAR-SIGHTEDNESS. See SIGHT, DEFECTS OF.

NEATH, nēth. A municipal borough and river port in Glamorganshire, South Wales, on the Neath, seven miles northeast of Swansea (Map: England, C 5). It has extensive copper and iron works. Copper, spelter, iron, tin-plates, and fine bricks are extensively exported; stone is quarried, and coal and culm are produced. The town, built on the site of the Roman station Nidum, contains the remains of an ancient castle, burned in 1231. The town received its first charter from Edward II. It owns its gas, water, slaughter-houses, markets, tramways, library, cemetery, the Victoria Gardens pleasure ground, a fair-field, and real estate worth \$1,000,000. Population, in 1891, 11,157; in 1901, 13,700.

NEBENIUS, nā-bā'nē-us, KARL FRIEDRICH (1785-1857). A German statesman and economist, born at Rhodt, near Landau. In 1819 he took a prominent part in working out the Baden Constitution, and for many years was the principal statesman of the Grand Duchy. In 1833 he was made Privy Councillor of State, and soon afterwards became Minister of the Interior and president of the Cabinet Council. Owing, however, to reactionary influences, he did not keep this position very long. In 1845 he again joined

the Cabinet, but the Revolution of 1849 compelled him to resign, and thereafter he devoted himself entirely to literary pursuits. He published, among many treatises on political economy: *Bemerkungen über den Zustand Grossbritanniens in staatswirtschaftlicher Hinsicht* (1818); *Ueber technische Lehranstalten* (1833); and wrote a *Geschichte der Pfalz*, which appeared posthumously (1874).

NEBO (from Bab. *nabû*, to call, name, proclaim). A deity of the Babylonians and Assyrians, mentioned in Isaiah xlv. 1. The name also occurs in the Old Testament as a geographical term. (See NEBO, MOUNT.) In cuneiform literature the form is Nabu or Nabium. After Babylon became the centre of the Babylonian Empire, Nebo took rank immediately after Marduk (see MERODACH), the head of the pantheon. He appears originally to have been the local patron deity of Borsippa, opposite the ancient city of Babylon, and there are grounds for believing that Borsippa was older than Babylon. This may have been one reason for the prominence which Nebo retained beside the powerful Marduk. In time Borsippa became a suburb of Babylon and the union between the two was symbolized by erecting a shrine to Nebo in Marduk's temple at Babylon to which Nebo was carried in solemn procession on the New Year's Day, while the statue of Marduk was on the return trip carried part way back to E-zida ('the true house'), Nebo's temple in Borsippa. To express further the relationship to Marduk, Nebo was regarded as the son of Marduk. Originally an agricultural deity, Nebo became in time the god of wisdom, and it is in this capacity that he was chiefly worshiped by the Assyrians. To Nebo and his consort Tashmitum Assyrian rulers ascribe the art of writing on stone and tablets, and all learning is eventually traced back to him. In this respect he supplanted an earlier god of wisdom, Ea, whose cult reaches back to a still higher antiquity than that of Nebo or Marduk. Consult Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898).

NEBO, MOUNT. The mountain from which, according to the Book of Deuteronomy (xxxii. 49; xxxiv. 1), Moses viewed the land of Canaan before his death. It has been identified with the mountain Neba—a ridge 2643 feet above the Mediterranean, situated five miles southwest of Heshbon. The name Nebo also occurs as that of a town in Moab (Num. xxii. 3, and on the Moabite Stone), and a town in Judah (Ezra ii. 29). It is identical in form with the name of a well-known Babylonian god Nabu (see NEBO), whose worship appears to have spread far to the west. The tradition associating the death of Moses with Mount Nebo may have had as a starting-point the existence of a sanctuary on the top of the mount, or, at all events, the sacred character of the mountain.

NEBRASKA (North American Indian, shallow water). One of the north central States of the American Union, popularly known as the "Blackwater State." It lies between the parallels of latitude 40° and 43° N., and between longitudes 95° 20' and 104° W., the latter meridian and the two parallels forming rectilinear boundaries. It is bounded on the north by South Dakota, on the east by Iowa and Missouri, on the

south by Kansas and Colorado, and on the west by Wyoming and Colorado. Its shape is that of a rectangle whose eastern end is cut off diagonally by the Missouri River, and whose southwestern corner is overlapped by the northeastern corner of Colorado. Its extreme length from east to west is 420 miles, and its breadth from north to south 208 miles. Its area is 77,510 square miles, of which 670 square miles are water, and 76,840 square miles, or 49,177,600 acres, land. It ranks thirteenth in size among the States.

TOPOGRAPHY. Nebraska lies in the region of the great plains skirting the eastern slope of the Rocky Mountains, toward whose foothills it rises in a gentle, undulating incline. The whole western half of the State lies at an elevation of more than 2500 feet above the sea. On the other hand, there are but few eminences rising much above the general level of the plain, except in the extreme west, where the foothills of the Rocky Mountains begin to appear. The highest point here is Wildcat Mountain, 5038 feet above the sea. As the rivers are deeply trenched in the soft drift material, their flood-plains in the east along the Missouri, the Platte, and their larger tributaries are lined with steep or rounded bluffs sometimes of considerable height. Nebraska is a prairie State.

HYDROGRAPHY. The State is drained entirely by the Missouri River and its tributaries. Owing to the gentle and regular slope of the land, most of these rivers flow in nearly straight parallel lines east or southeastward, and they are for the most part wide and also shallow. The three principal rivers, besides the Missouri (on the boundary), are the Platte in the centre, the Niobrara in the north, these two flowing through the whole length of the State, and the Republican in the south, the latter coming from Kansas, and returning to that State to form the Kansas River.

CLIMATE. The climate is continental, dry, and exhilarating. The mean temperature for January is 19.7° and for July 74.8°. The extremes are very great, the mercury sometimes falling to -42° and at times rising to 114°. The nights are cool. The climate of the western third of the State is, however, quite arid, and differs considerably from that of the eastern third, where agriculture is wholly successful. The annual rainfall is 23 inches, but this is very unevenly distributed. In the east it is sufficient to support agriculture, ranging from 30 inches on the average to a local maximum as high as 50 inches. In the western half it is below 20, and in the extreme west as low as 12 inches, so that here agriculture cannot be carried on successfully without irrigation. The greatest amount of rain falls in May and June, and more than three-fourths of the annual rain falls during the six months of the growing season, April to September. The prevailing winds are from the northwest, and these generally temper the summer heat, but occasionally the heat is aggravated by the hot winds from the southwest.

SOIL. More than half of the State is covered with glacial drift and loess, the drift being confined to the eastern counties. The loess forms a soil of inexhaustible fertility. Its deposits range in thickness from 5 to 150 and even 200 feet, and though soft and easily excavated, it is very compact and able to withstand moisture and exposure. The bluffs along the bottom-lands are

composed of this material. The alluvial lands of the river valleys also afford excellent soil, though scarcely exceeding the loess in quality, and as the State was anciently a lacustrine bed, and later a region of peat bogs, large areas are covered with a very black vegetable mold which in some places becomes true peat, and which has given the dark color to the rivers, whence the popular name of the State is derived. Considerable areas in the west, as much as 20,000 square miles, are covered with sand dunes. These are found partly in the southwestern corner, but chiefly in the large and arid area north of the Platte and west of the 100th meridian. In the extreme west the Tertiary marls, even in the Bad Lands, can be made productive by irrigation.

For Flora and Fauna, see the articles **ROCKY MOUNTAINS** and **UNITED STATES**.

GEOLOGY AND MINERALS. Except in the Bad Lands of the northwest and in some other isolated localities, formations older than the Pleistocene are nowhere exposed. They are composed of nearly horizontal strata outcropping below the drift in wide bands running southwest to northeast. Four principal formations are represented, which in order from southeast to northwest are the Upper Carboniferous, Permian, Cretaceous, and the Miocene and Pliocene Tertiary. The Miocene is the one which crops out in the Bad Lands. Glacial drift covers the eastern third of the State, the remaining Pleistocene formation consisting of alluvial deposits laid down in the lakes which were formed at the close of the glacial period. Clay and a little building stone are the only important minerals. The clay deposits afford material for the production of brick and tile; the product for 1900 was valued at \$683,958, three times the value of the product in 1895.

AGRICULTURE. In agricultural development the State advanced rapidly during the last three decades of the nineteenth century, and at the end of the period ranked as one of the most important agricultural States. In 1900, 60.8 per cent. of the total land area was included in farms, and of this 61.6 per cent. was improved. Efforts at irrigation in the arid areas of the west have been attended with some success, the irrigated acreage reported in 1899 being 148,538, of which about 90 per cent. was watered from the North Platte River. In some regions there are supplies of underground water, which can be utilized by means of windmills and small reservoirs—a system which promises to be of some importance in the agricultural development of the arid regions. Since 1880 the average acreage of farms increased from 156.9 acres to 246.1 acres. This is due to the establishment of extensive live-stock ranches in the western part of the State and the cultivation of large corn-producing areas, and is in spite of the tendency to divide farm holdings which has characterized the same period in the eastern part of the State. The number of tenant-operated farms is increasing very rapidly, and amounted in 1900 to 36.9 per cent. of the total number of farms.

Corn is the leading crop, nearly one-half of the cultivated acreage of the State being devoted to it. In 1880 the acreage of wheat was only slightly less than that of corn, but in the following decade there was an actual decrease of more than two-fifths in the area devoted to it, which, how-

ever, revived in the last decade of the century, amounting in 1900 to three times that of 1890. There were large increases in the area devoted to oats and rye respectively during each of the last two decades of the nineteenth century; rye, however, is of only minor importance. Grasses cut for hay are chiefly wild, salt, or prairie grasses, but millet, alfalfa, and other cultivated grasses are also grown. Potatoes and other vegetable crops are extensively grown. In the last decade of the past century a rapid increase was made in the cultivation of sugar beets, the census of 1900 reporting a total of 8662 acres devoted to them. The growing of orchard fruits is mainly confined to the southeastern part of the State. Between 1890 and 1900 the number of fruit trees increased from 1,840,704 to 6,240,118, considerably over half of this number being apple trees.

The acreage of the principal farm crops for the census years indicated is as follows:

CROP	1900	1890
Corn.....	7,335,187	5,480,279
Wheat.....	2,538,949	798,855
Oats.....	1,924,827	1,508,515
Rye.....	178,920	81,373
Barley.....	92,098	82,590
Hay and forage.....	2,823,662	2,462,245
Potatoes.....	79,901	106,722

STOCK-RAISING. Every decade since the settlement of the State has witnessed an increase in the number of every variety of domestic animals. In general, the increase was greatest during the ten years from 1880 to 1890. The most noteworthy gain in the last decade of the century was that made in the number of cattle other than dairy cows, amounting to 62.7 per cent. In the census year 1900, \$4,137,000 was realized from the sale of dairy products, and the value of the product consumed on farms was nearly as great. In the same year only three States exceeded Nebraska in the number of swine reported.

The following table gives the number of the principal species of domestic animals for the years indicated:

	1900	1890
Dairy cows.....	512,544	506,048
Other cattle.....	2,663,699	1,637,562
Horses.....	796,318	626,789
Mules and asses.....	55,856	46,612
Sheep.....	335,960	209,243
Swine.....	4,128,000	3,618,647

MANUFACTURES. In manufacturing Nebraska is one of the least developed States. In 1900 there were 24,461 wage-earners, or only 2.3 per cent. of the total population, engaged in manufactures. The State's industries have developed almost wholly since 1880. In the two decades beginning with that year the number of wage-earners more than quintupled, and the value of products (\$143,990,000 in 1900) increased over eleven fold. The lack of cheap fuel has been a serious handicap, but the development of coal fields in adjoining States is helping to overcome this obstacle. The advantages of cheap transportation are afforded by the Missouri River, and Omaha in particular has unusual railroad facilities. As yet the industries are limited mainly to those manufactures that are based upon agricultural and stock-raising products. Thus four industries—viz. slaughtering and meat-packing, and the manufacture of malt liquors, flour and grist-mill products, and cheese, butter, and condensed milk—yielded 89.6 per cent. of the total value for the nine leading industries given in the table below. The value of the products of the slaughtering industry alone was nearly equal to that of all other industries combined. The rapid growth of the industry began in 1884, and South Omaha, as a slaughtering centre, is surpassed only by Kansas City and Chicago. The factory production of butter has developed wholly since 1881. Other leading industries are printing and publishing, and car and other railroad shop construction, the manufacture of saddlery and harness, brick and tile, and lumber and planing mill products. The last two suffered a decrease during the last decade of the century. South Omaha and Omaha are the only large manufacturing centres. The following table shows the relative importance of the leading industries, and their development during the decade 1890-1900:

INDUSTRIES	Year	Number of establishments	Average number of wage-earners	Value of products, including custom work and repairing
Total for selected industries for State.....	1900	1,520	13,386	\$92,372,460
	1890	1,045	10,467	42,260,098
Increase, 1890 to 1900.....		475	2,919	50,112,367
Per cent. of increase.....		45.5	27.9	118
Per cent. of total of all industries in the State.....	1900	28.1	54.7	64
	1890	34.7	61.2	45
Slaughtering and meat-packing, wholesale.....	1900	8	6,063	71,018,339

	1890	443	1,771	3,222,368
Saddlery and harness.....	1900	391	568	1,783,742
	1890	151	419	1,028,540

TRANSPORTATION. The eastern part of Nebraska enjoys adequate railroad facilities, and three lines, the Burlington and Missouri River, the Union Pacific, and the Fremont, Elkhorn and Missouri Valley, cross the State from east to west. The western part of the State has no north and south lines. The principal era of construction was in the decade 1880-90, during which the mileage increased from 1953 miles to 5407 miles. There were in 1900 5695 miles in operation. There is a State Board of Railroad Commissioners. The Missouri River is not used for purposes of navigation.

BANKS. The first session of the Territorial Legislature in 1855 pronounced currency banking a crime, and no banks were chartered. The necessity for currency, however, was such that insurance companies issued a disguised form of paper money. In 1856, under special charters, certain institutions did a banking business, in spite of the laws to the contrary. The general panic of 1857 swept all such institutions out of existence. For almost a decade all the banking business was performed by private banks; then national banks began to be organized.

A considerable increase in the number of banks came about in 1880, when the era of railroad building commenced. The number of State banks almost doubled in one year, and in the following decade (1880-90) increased from 83 to 513, but diminished somewhat after the panic of 1893. The national banks during the same period increased from 10 to 120. An act regulating banks was passed in 1889, establishing a State Banking Board, and providing for reports and examinations. In 1893 there were eight savings banks in Omaha, but only one existed in 1900. The following table is compiled from the official reports of 1902:

	National banks	State and private banks
Number of banks.....	124	458
Capital.....	\$10,088,000	\$7,521,000
Surplus.....	2,068,000	1,271,000
Cash, etc.....	4,436,000	2,437,000
Loans.....	44,198,000	28,527,000
Deposits.....	41,093,000	35,069,000

FINANCES. The State Constitution forbids any bonded debts of over \$50,000 except in case of war, but when the disbursements have exceeded the receipts, State warrants have been issued which drew interest. In 1891 an act was passed by the Legislature relating to registration of unpaid warrants, which practically made them a bonded debt. Besides, special relief bonds were authorized and so a funded State debt created which in 1894 amounted to more than \$500,000. This funded debt was paid out by 1898. On December 1, 1902, the floating indebtedness of the State was \$1,989,328, but the educational trust funds held \$1,457,351, so that the net indebtedness was small. The income for the preceding twenty-four months was \$6,742,551, and the expenditures \$6,925,315. The educational expenditures constituted almost two-thirds of the whole.

GOVERNMENT. The present Constitution was adopted in 1875. If three-fifths of the members of each House approve a proposed amendment, it is submitted to a vote of the people, and if ap-

proved by a majority of the electors voting, it becomes a part of the Constitution. Every male person of the age of twenty-one years and upward who is a citizen of the United States, or has declared his intention thirty days previous to an election to become a citizen, and who is neither insane, an idiot, nor an unpardoned felon, shall be entitled to vote, provided he has resided in the State six months and in the minor districts a term prescribed by law. Registration of voters is required by law in cities of over 2500 inhabitants. The State elections are held biennially on the Tuesday after the first Monday in November.

LEGISLATIVE. The Constitution places a maximum limit on the Legislature of 33 Senators and 100 Representatives. It meets biennially in odd-numbered years on the first Tuesday in January. Each member is elected for two years and receives \$5 a day and mileage, but salary is allowed for only sixty days at any one sitting. Unless at the request of the Governor, bills cannot be introduced after the fortieth day of the session. The power of impeachment rests with the Senate and House in joint convention; the trial of impeachment, with the judges of the State district courts.

EXECUTIVE. The Governor, Lieutenant-Governor, Secretary of State, Auditor, Treasurer, Superintendent of Public Instruction, Attorney-General, and Commissioner of Public Lands and Buildings each hold office for two years. The Governor's veto extends to any item or items of appropriation bills. He has the usual pardoning power, subject to legislative regulation.

JUDICIARY. The judicial power is vested in a Supreme Court, district courts, county courts, justices of the peace, police magistrates, and inferior courts created by law for cities and incorporated towns. The three Supreme Court judges are elected by the State at large for six years. The State is divided into six districts, in each of which a district judge is elected for four years. The county judges are elected for two years.

LOCAL GOVERNMENT. No county can be created with or reduced to a less area than 400 square miles, nor can any county be divided without the approval of a majority vote of the people. The Legislature provides by law for township organization.

STATUTORY PROVISIONS. Property acquired by a wife after marriage remains separately hers. Women who own assessed property, or who have children of school age, may vote in school meetings. The liquor laws provide for high license. The legal rate of interest is seven per cent., ten being allowed by contract, and the penalty for usury is forfeiture of interest and cost.

The State has six Representatives in the National Congress. The capital is Lincoln.

POPULATION. The population of Nebraska by decades was: 1860, 28,841; 1870, 122,993; 1880, 452,402; 1890, 1,058,910; 1900, 1,066,300. In the decade 1880-90 Texas was the only State west of the Mississippi whose absolute growth was as great as that of Nebraska, but in the following decade the population remained almost stationary, its increase being exceeded by that in every other State in the Union but one. Many of the northeastern counties of the State made large gains in the last decade of the century, but elsewhere decreases were common. Owing to its arid-

ity, the western half of the State contains but few people. The foreign-born population in 1900 numbered 177,347, the Germans exceeding any other nationality. In the same year there were 6269 negroes and 3322 taxed Indians. There are 13.9 inhabitants to the square mile. Nebraska is one of the two States which suffered an actual decrease in urban population during the last decade of the past century. In 1900 there were eleven cities which exceeded 4000 inhabitants each, and together constituted 20.8 per cent. of the total population. The largest three cities in 1900 were: Omaha, 102,555; Lincoln, 40,169; South Omaha, 26,001.

CHARITABLE AND PENAL INSTITUTIONS. The Governor, Commissioner of Public Lands and Buildings, and the State Superintendent of Public Instruction constitute a Board of Charities and Correction. The State institutions are as follows: Asylums for the insane at Lincoln and at Norfolk, Asylum for Incurable Insane at Hastings, Soldiers and Sailors' Home at Grand Island, Soldiers and Sailors' Home at Milford, Home for Friendless at Lincoln, State Industrial School at Kearney, Girls' Industrial School at Geneva, Industrial Home at Milford, State Penitentiary at Lincoln, Institution for Feeble-Minded at Beatrice, Institution for Deaf and Dumb at Omaha, Institution for Blind at Nebraska City. About one-half of the counties have poor farms (1902), the inmates at these aggregating about 800, while half as many other persons receive continuous aid from the counties, and as many more receive partial aid.

EDUCATION. Nebraska bears the distinction of having the lowest proportion of illiteracy in the United States (2.3 in 1900). In 1902 the State had 6813 public schools (465 graded), with 9629 teachers, of whom 1862 were males. The school population (five to twenty-one years of age) amounted, in 1902, to 375,340, the enrollment to 289,468, and the average daily attendance to 185,755. The average length of the school term in the same year was 138 days. The average monthly salary for male teachers increased from \$39.24 in 1871 to \$49.15 in 1902; of female teachers, from \$36.64 to \$38.51. The expenditures on education in 1902 amounted to \$4,435,338, or about \$23.90 per pupil in average attendance. It is reported that only about 5.5 per cent. of the teachers of the State are graduates of a college or a university, about 40 per cent. have a high-school education or its equivalent, 29 per cent. are without high-school training, and less than 16 per cent. have any professional training. To improve the professional standing of the teachers, a number of union normal institutes have been organized, giving a four weeks' summer course for teachers. The normal school at Peru and the normal college at Wayne are State institutions.

In 1900 there were in the State for purposes of secondary education 250 public high schools, with 15,208 secondary scholars, and 19 private high schools and academies, with 684 students. The chief institutions for higher education are the University of Nebraska (q.v.), at Lincoln; the University of Omaha (Presbyterian), at Bellevue; Cotner University (Christian), at Bethany; Doane College (Congregational), at Crete; Nebraska Wesleyan University (Methodist Episcopal), at University Place.

RELIGION. The church members or communi-

cants in the State form only about 20 per cent. of the total population. The principal denominations, in order of their importance, are the Methodist, comprising over one-fourth of the church members, the Roman Catholic, the Lutheran, the Presbyterian, the Baptist, and the Congregational.

MILITIA. In 1900 the State had a population of militia age amounting to 235,572. The aggregate strength of the militia in 1901 was 1595 men.

HISTORY. The territory now constituting the State was originally a part of the Louisiana Purchase, and afterwards a part of Missouri Territory. Coronado (q.v.), setting out from Mexico in search of the seven cities of Cibola and of Quivira, claimed that in 1541 he journeyed on the great plain as far as latitude 40° N., the southern boundary of the State. There are stories of other Spanish explorations, but little is known of them. In 1673 Marquette passed the mouth of the Missouri and marked the Platte from Indian stories. Pierre and August Choteau, brothers engaged in the fur trade, went beyond the forks of the Platte in 1762. Lewis and Clark, in 1804-06, skirted the boundary of the present State. The first known settlement was a trading post founded at Bellevue by Manuel Lisa in 1805. The American Fur Company placed a post here in 1810, and posts were established at Omaha in 1825 and at Nebraska City in 1826. Fort Atkinson was established in 1821, but abandoned in 1827. With the admission of Missouri as a State in 1821, the territory was left practically without government. In 1834 part of the region was attached to Arkansas, the jurisdiction of the district court of Missouri was extended over another part, and a third portion was joined to Michigan Territory. The next year Col. Henry Dodge, with a force of dragoons, encamped at what is now Fort McPherson, and commenced negotiations with the Indians looking toward their removal to reservations. Many tribes of the Eastern Indians were then being transferred to this 'Indian country.' The Mormons in 1845-46 wintered within the territory, and the next year troops destined for service in New Mexico spent the winter at old Fort Kearney. New Fort Kearney was established on the Oregon trail in 1848. Thousands of gold seekers passed through the territory in 1849-50, and some stopped on the way in defiance of the law which forbade settlement among the Indians. In 1844 Stephen A. Douglas, then a member of the House of Representatives, introduced a bill to organize a Territory, but the bill was never reported from the committee. Another unsuccessful attempt was made in April, 1848, and still another in December. The Indians, who foresaw the inevitable extension of white settlement, wished for a Territorial government in order to sell lands to better advantage. The Wyandots, led by their half and quarter bloods, in 1851-52 petitioned Congress to establish a Territory, with no success. A Territorial Delegate, Abeland Guthrie, was chosen in October, 1852. A bill to organize Nebraska Territory passed the House February 2, 1853, but did not reach a vote in the Senate. In order to force action, a Provisional Government was organized by the residents, and William Walker was elected Governor July 25, 1853. Senator Douglas reported a bill in January, 1854, providing for the erection of a Ter-

ritory, based on his principle of 'squatter sovereignty.' It was amended to provide for two Territories (see KANSAS-NEBRASKA ACT), passed both Houses, and was signed by the President May 30th. By this act the boundaries of the Territory of Nebraska were defined as the 40th and 49th parallels of latitude, from the Missouri to the summit of the Rocky Mountains. In 1861 all the region north of the 43d parallel was constituted part of Dakota Territory, a small part from the southwest corner was added to Colorado, and the western boundary was extended to the 110th meridian. With the creation of Idaho Territory in 1863, the State was reduced to its present limits except for a slight addition in the northwest in 1882.

The question of Statehood came up with the organization of the Territory. In 1860 the people voted down a proposal to call a constitutional convention. Congress passed an enabling act in 1864, but not until 1866 was a constitution adopted. The act of admission passed by Congress July 18th was not signed by the President. In February, 1867, he again vetoed a similar bill, but it was passed over the veto, and on March 1st the State was admitted. The history of the Territory and State has been one of peaceful development, though during the Civil War the Indians were restless, and in August, 1864, a notable rising occurred.

Politically Nebraska has been Republican in national elections, with the exception of the year 1896, when it was carried by the Democratic candidate, William Jennings Bryan, a resident of the State. The following is a list of the Governors of the State, with their party affiliations:

TERRITORIAL

Francis Burt.....	1854
T. B. Cuming (acting).....	1854-55
Mark W. Izard.....	1855-57
T. B. Cuming (acting).....	1857-58
William A. Richardson.....	1858
J. S. Morton (acting).....	1858-59
A. S. Black.....	1859-61
A. S. Paddock (acting).....	1861-67
Alvin Saunders.....	1861-67

STATE

David Butler.....	Republican.....	1867-71
W. H. James (acting).....		1871-73

NEBRASKA. A river of Nebraska. See PLATTE.

NEBRASKA, UNIVERSITY OF. A co-educational State university at Lincoln, Neb., founded in 1869. It comprises the Graduate School; the College of Literature, Science, and Arts; the Industrial College; the College of Law; the College of Medicine; the School of Fine Arts; and the Affiliated School of Music. There is also a summer session. The regents have intrusted to its charge the United States agricultural experiment station, the State Museum, the Botanical and Geological Surveys, and the superintendency of farmers' institutes. Students are admitted on examination or on certificates from accredited schools. Military drill is compulsory for first and second year male students in the college, and physical training for all first and second year woman students. The students in 1903 numbered 2500, and the faculty consisted of 180 professors and instructors. The library contains 61,000 volumes, supplemented by eleven departmental libraries, including the departments of pure and applied sciences, law, and classical philology. The campus occupies twelve acres in the heart of Lincoln, and with the buildings is valued at \$1,000,000. The endowment lands of the university were in all 136,080 acres, of which about 11,000 acres remain unsold. The principal accruing from former sales is paid into the permanent endowment funds. The income of the university for all purposes amounted in 1903 to \$402,000.

NEBRASKA CITY. A city and the county-seat of Otoe County, Neb., 56 miles south of Omaha; on the Missouri River, here spanned by a fine steel railroad bridge, and on the Burlington and Missouri River (Burlington Route) and the Missouri Pacific railroads (Map: Nebraska, J 3). It has a United States Government building, the State Institute for the Blind, and a public library. The city is the centre of a noted fruit belt, also of a rich corn region. The principal industrial plants include large stock yards, grain elevators, cereal and flour mills, lumber and planing mills, foundries, press drill works, a starch factory, packing and provision house, plow works, breweries, brick works, a distillery, a cannery, and a cold storage plant. Laid out and settled in 1855 on the site of old Fort Kearney, Nebraska City was incorporated as a city of the second class in 1871. Twenty years later it received a charter of the first class, under the provisions of which it is governed by a mayor, chosen every two years, and a unicameral council, one-half of the members being elected by wards and the other half at large. Population, in 1890, 11,941; in 1900, 7380.

NEBUCHADNEZZAR, nēb'ū-kād-nēr'zēr, or, more correctly, **NEBUHADREZZAR** (Heb., from Babylonian *Nabu-kudūrri-uṣur*, Nabu [Nebo] protect the boundary). The great King of the Neo-Babylonian Empire, who ruled c.604-561 B.C. He was the second of the name, Nebuchadnezzar I. having been a distinguished Babylonian monarch of the second half of the twelfth century B.C. He was the son of Nabopolassar, Viceroy of Assyria in Babylonia, who upon the death of Assurbanipal (B.C. 624) gained control of the

Babylonian portion of the latter's empire. The family was Chaldean, that is, of a South Babylonian race, hence the use of this name for the dynasty and for the land in later ages. Nabopolassar entered into alliance with the other great enemy of Assyria, the Medes, marrying his son to a daughter of the Median King, Cyaxares. At this time a horde of barbarians, commonly called Scythians by historians, appeared upon the scene as assailants of the Assyrian Empire, and about B.C. 607 Nineveh fell before the combined assault. The Assyrian Empire was forthwith partitioned; the Medes took possession of the Upper Tigris Valley and the lands to the north and east of the Euphrates; Nabopolassar made firm his control of the Euphrates Valley; and from the west Necho, King of Egypt, advanced to the great river to reclaim for his land its ancient dominion in Syria. The division of spoils between Media and Babylon seems to have been prearranged, but Egypt's intrusion could not be suffered, and Nabopolassar sent Nebuchadnezzar against Necho. The latter was utterly defeated at Carchemish (B.C. 605), and Nebuchadnezzar advanced as far as Egypt to recover Syria. But he was recalled by the news of the death of his father, and accomplished the remarkable feat of leading his army by a forced march across the desert to Babylon to secure the succession. Unfortunately, we possess but scanty materials for the study of the continuation of Nebuchadnezzar's military and political career. The sources are the partial accounts found in the Bible, Josephus (quoting Berosus; *Ant.*, x. 6-11; c. *Ap.* i. 21), and Herodotus (containing obscure information concerning Egypt; ii. 151 seq.), and a fragment of Menander. The books of Kings, Jeremiah, and Ezekiel enable us to follow clearly Judah's relation to its new lord. At first King Jehoiakim submitted, but about B.C. 600 rebelled. After some delay Nebuchadnezzar sent his army against Jerusalem, which fell in 597, Jehoiakim dying during the siege. His son, Jehoiachin, suffered the Imperial chastisement of exile along with the upper classes, an uncle, Zedekiah, being appointed to the throne by the conqueror. But the new King succumbed at last to the temptations to revolt offered by his neighbors, and especially by Hophra, the ambitious King of Egypt, and drew upon himself the wrath of the Great King. Jerusalem stood a siege of sixteen months, and upon its fall (B.C. 586) was razed to the ground, while a second deportation was made, Zedekiah undergoing a cruel physical punishment. This campaign broke for good the refractory spirit of the Syrian States, Tyre alone holding out and suffering a famous siege of thirteen years, the end of which was an honorable capitulation. In B.C. 567 occurred a campaign which carried Nebuchadnezzar into the heart of Egypt, where, however, he obtained no permanent results. But it is the glory of this King that he prided himself not on the arts of war, in which he was so illustrious (he seems to have prosecuted them only at necessity), but on his works of peace. With two fragmentary exceptions, his inscriptions are devoted to his building operations, especially in Babylon, which, destroyed as it had been by Sennacherib and since then racked by civil war, he rebuilt and restored to more than its pristine glory. The excavations of the Germans under Dr. Koldewey are now uncovering the extent and grandeur of the fortifications, the

palace, the temple of Marduk, and the great Procession Street, which Nebuchadnezzar reared out of patriotism and an eminent devotion to the gods. The sister city Borsippa shared in his benefactions. Nebuchadnezzar's outward successes seem to have been based upon noble kingly qualities, to which the contemporaneous Jewish prophets and even the tradition of the late Book of Daniel bear witness. According to the latter book, his life was for a time clouded by a madness (lycanthropy), for which tradition there exists some other slight testimony. His dynasty ended with his son, Evil-Merodach, whose reign of two years was terminated by assassination. The collapse of the ancient Semitic empire immediately followed. For Nebuchadnezzar's inscriptions, consult: Winckler, *Keilschriftliche Bibliothek*, vol. iii., part 2 (Berlin, 1892), and Ball in the *Proceedings of the Society for Biblical Archaeology*, vols. x.-xi. (1888-89). For excavations in Babylon, consult the current *Mittheilungen der deutschen Orient-Gesellschaft*. Also consult Rogers, *History of Babylonia and Assyria*, vol. ii. (New York, 1900).

NEBULA (in Medicine). See LEUCOMA.

NEBULÆ (Lat. nom. pl., clouds, vapors, mists). Patches of luminous matter occurring in considerable numbers in various parts of the sky, and differing from the stars in that they do not present simply small definite points of light, but rather large surfaces of widely varying brilliancy. We have acquired much exact knowledge about the nebulae, especially in recent years, since the application of photographic processes to astronomical observation; and they have also been made the subject of extensive philosophical theories as to the origin, development, and construction of the universe, of which some are based upon too many hypothetical considerations to receive the unqualified assent of astronomers.

Only two nebulae are visible to the naked eye: that in Andromeda and the great nebula in Orion. The former consists of an oval mass of light, about three times as long as it is broad, and surrounded with several more or less distinct disconnected oval rings. There is also a central condensation in the middle of the whole mass. The Orion nebula, on the other hand, is of quite irregular shape, contains a number of stars, and is indented with at least one very large non-luminous break known as the 'fish-mouth.' Both these large nebulae, in the telescopic field of view, cover a space of more than one square degree on the sky's surface. When tested by long-exposure photographs, they are found to be of truly gigantic size. It is now admitted that the entire constellation of Orion is included in the outlying parts of the great nebula. Condensations appear to fasten about the stars of the constellation; and indeed the conclusion seems irresistible that we are looking upon a universe in course of formation out of plastic and gaseous material. Many of the less conspicuous nebulae are round or oval; often have a stellar central condensation, and sometimes one of a disk-like form with uniform surface luminosity. These are the so-called 'planetary nebulae.' Then there are 'annular' or ring-shaped nebulae, and spiral nebulae. These last look like great whirlpools of matter apparently rotating rapidly and trailing long streamers of light. The very latest researches

in photographing nebulae seem to indicate that the spiral form is in fact the most prevalent one. The application of the spectroscope, and especially the photographic spectroscope, to nebulae study has proved that many nebulae are really gaseous in constitution, and not simply aggregations of stars too small and close together to be separated even by our most powerful telescopes. It has also been possible to measure with the spectroscope the velocity with which some of the nebulae are moving through space in the direction of our solar system; and it is found that nebular velocities are of about the same order of magnitude as those observed in the case of ordinary stars. As to the changes of the shape and form of individual nebulae we have no decisive evidence. Indeed, the outlines of these objects are so hazy that no reliance can be placed upon ordinary drawings; and even photographs can mislead us, since what we see upon them depends in great measure upon the length of time during which the sensitive plate was exposed to the nebula's light. The number of the nebulae at present known is not far from 10,000; and the best catalogue of them is by Dreyer, published in the *Memoirs* of the Royal Astronomical Society of London.

As to their distance our knowledge is still in the conjectural stage. No one has yet measured a nebular parallax (see PARALLAX) successfully; but it is extremely probable that their distances, like their velocities of motion, are of the same order of magnitude as the corresponding quantities for the fixed stars.

The theory of cosmic evolution known as the nebular hypothesis of Laplace intends to account for the origin and development of our solar system; beginning with a presupposed mass of formless matter. This mass, assuming a rotation under the influence of natural forces, might be expected to take upon itself the form of a flattened sphere; and if a contraction of its bulk should occur after the lapse of ages of time, certain rings of matter might be left behind, as it were, by the contracting mass. Such rings have indeed a certain analogy in the Andromeda nebula; and their possible formation once granted, there is nothing to prevent the gradual breaking up of a ring under the action of gravitational forces. Its matter might then be gathered into a single ball, and thus would be formed a planet circulating in an orbit around the central condensing mass destined in later ages to form the sun itself. It will be seen that this hypothesis, while plausible, rests upon a basis of imagined possibilities rather than ascertained facts. While, therefore, it is most interesting, it must on no account be reckoned among those astronomical theories (such as gravitation) whose foundation is as strong as that underlying any of the scientific truths coming within the range of human knowledge. See COSMOGONY.

NEBULAR HYPOTHESIS. See COSMOGONY.

NEB'ULY, or **NEBULÉ** (Fr. *nébulé*, from OF. *nebule*, cloud, from Lat. *nebula*, Gk. *νεφέλη*, *nephelē*, Skt. *nabhas*, OChurch Slav. *nebo*, cloud). One of the partition lines in heraldry (q.v.).

NECESSARIES (Lat. *necessarius*, requisite, indispensable, from *neccesse*, OLat. *neccessum*, indispensable, from *ne*, not + *cessus*, p.p. of *cedere*,

to yield). In its technical legal sense, the term denotes such articles as are reasonably suitable or necessary to maintain a person in the station or condition in life which he occupies at the time they are furnished. The origin of the above signification of the term was in the doctrine of the common law that married women, infants, lunatics, or any incompetent persons cannot be held on their contracts; and in order to obviate the harsh effect of this rule, the courts adopted the policy of holding such persons for any articles furnished them which were actually necessary to sustain life. The courts continued the use of the word necessary, but have extended its legal meaning until to-day it is a very elastic term. It is not limited only to food and clothing sufficient to sustain life, but may include articles which might be considered luxuries by persons in some stations in life, according to the circumstances of the case. In order to determine whether an article is a necessary, the character of the article itself, the use for which it was designed, the age, social position, wealth, and previous mode of living of the person to whom it was furnished must be considered. These are questions of fact, and must, therefore, be submitted to a jury. See BANKRUPTCY; CONTRACT; INFANT; LUNATIC; HUSBAND AND WIFE; and consult authorities referred to under CONTRACT, etc.

NECHES, *nēch'ez*. A river of eastern Texas, rising in Van Zandt County, and flowing south-east into Sabine Lake, whence its waters, with those of the Sabine River, find their way by Sabine Pass into the Gulf of Mexico (Map: Texas, G 4). It is about 350 miles long, and waters a wide and fertile portion of Texas.

NECHO, *nē'kō* (Egyptian *Nekau*). The second King of the twenty-sixth Egyptian dynasty, called Pharaoh-nechoh in the Bible (II. Kings xxiii. 29 et seq.), and Necho, Nechaus, etc., by Greek writers. He succeeded Psammetichus I., and reigned from B.C. 610 to 594. On the downfall of the Assyrian Empire, Necho attempted to gain possession of Syria, and, at the outset of his campaign, defeated and slew Josiah, King of Judah, who opposed him at Megiddo. Jehoahaz, the son of Josiah, after a brief reign of three months, was deposed by the Egyptians. Eliakim, who changed his name to Jehoiakim, was made King by Necho in place of Jehoahaz, and Judah was subjected to a tribute of 100 talents of silver and one of gold. Necho conquered Syria as far as the Euphrates, but was completely defeated at Carchemish by the Babylonian Crown Prince, Nebuchadnezzar (B.C. 605), and lost all his conquests. Although unable to cope with the Babylonian Empire, Necho was an active and energetic ruler. He constructed the first canal from the Nile to the Red Sea, a precursor of the modern Suez Canal. The statement of Herodotus that he left it unfinished is incorrect. Necho also built a fleet and sent it, manned by Phœnician sailors, on an exploring expedition around Africa. Consult: Wiedemann, *Geschichte Aegyptens von Psammetich I. bis auf Alexander den Grossen* (Leipzig, 1880); Budge, *A History of Egypt* (New York, 1902).

NECK (AS. *hnecca*, OHG. *hnac*, *nac*, Ger. *Nacken*, neck; probably connected with OIr. *cnocc*, OBret. *cnoch*, hill, elevation). The por-

tion of the anatomy between the head and the shoulders. In the human being there are several muscles that pass from the skull to the thorax, which, together with the œsophagus and the trachea, form the principal bulk of the neck. Through the neck run very important blood-vessels between the brain and the thorax, among these being the carotid arteries and the jugular veins, an incision into either of which usually causes death very promptly. Through the œsophagus the food passes into the stomach, and through the trachea the air passes into the bronchi and thence into the lungs. The principal muscles of the neck are the platysma myoides, the sterno-cleido-mastoid, the infra-hyoid and supra-hyoid, the muscles of the tongue, the muscles of the palate and of the pharynx, and the prevertebral muscles, as well as certain of the muscles of the back which are inserted into the skull; as the trachelo-mastoid, complexus, transversalis cervicis, the rectus group, the longus colli, the three scaleni, and the cervicalis ascendens. Several of these muscles form important triangles, with the aid of the ramus of the jaw, the clavicle, the hyoid bone, and the imaginary centre line of the body. These triangles are of use to the surgeon in locating and describing important structures. For instance, the digastric triangle is bounded by the jaw, above, and on either side by a belly of the digastric muscle, attached (at the apex of the triangle) to the hyoid bone below. Within this triangle are to be found a portion of the facial artery and of the lingual artery; and it is the site chosen for ligating the last-named artery.

In man there is present at the back of the neck a rudiment of an important elastic ligament, which in some of the lower animals serves to sustain the weight of the head. It is called the *ligamentum nuchæ*, and is a yellow elastic ligament, which represents in the neck the supraspinous and inter-spinous ligaments of the vertebræ of the lower part of the spine. It extends from the external occipital protuberance to the spinous process of the seventh cervical vertebra.

NECK'AM, ALEXANDER (1157-1217). An English Latinist, born at Saint Albans, Hertfordshire, foster brother of King Richard I. Neckam studied in Paris, returned to England, and entered an Augustinian monastery at Saint Albans, where he did most of his writing. He wrote, on natural science, a prose essay, *De Naturis Rerum*, and *De Laudibus Divinæ Sapientię*, a treatment of the same subject in elegiac verse (both edited by Wright in the "Rolls Series of Chronicles and Memorials," 1863); also forty-two fables. The fables are edited and Neckam's life sketched by Hervieux, *Les fabulistes latins* (3 vols., Paris, 1883-93).

NECKAR, nĕk'kär. One of the principal right affluents of the Rhine. It rises in the Swabian Jura in the southwestern part of Württemberg, near the source of the Danube, flows northward through Württemberg, then west through Baden, and enters the Rhine at Mannheim, 30 miles south of the mouth of the Main (Map: Germany, C 4). It is 247 miles long, and flows for the greater part of its course through a series of lake basins surrounded by vine-clad hills. It is navigable for steamers to Heilbronn, 71 miles, and for smaller vessels to Cannstatt, 116 miles. Heidelberg lies on its banks near its

mouth, where the river is flanked by picturesque hills crowned by ruined castles.

NECKER, nă'kär, JACQUES (1732-1804). A French statesman and financier. He was born September 30, 1732, at Geneva, where his father was professor of public law. In 1747 Necker went to Paris and entered a banking house, where he served his apprenticeship in finance. In 1762 he established a banking business of his own in Paris and acquired a large fortune during the Seven Years' War. After retiring from business he became the representative of Geneva at the French Court and also a syndic of the French East India Company. He likewise began his career as a writer, and in 1773 gained the prize at the French Academy by his *éloge* on Colbert. He acquired a further reputation by his publications on political economy and finance, particularly his *Essai sur la législation et le commerce des grains* (Paris, 1775). On the removal of Turgot from office in June, 1776, Necker was called to assist in financial affairs, and after the brief administration of Clugny he was made Director-General of Finances in June, 1777. Necker succeeded in restoring to some degree of order the general financial affairs of the country, though mainly by the perilous expedient of borrowing, which he was enabled to do to an almost unlimited extent, owing to the confidence reposed in his financial dexterity. He reformed and systematized the financial administration, made taxation more equitable, and restored public confidence in the Government. This was the most brilliant period of his life, and the *salon* of Madame Necker was the rendezvous for all the brilliant literary and political lights of the day. Necker's Protestantism, however, his extraordinary vanity, and some retrenchments which he had made in the royal household, together with his publication on the financial affairs of France, *Compte rendu au roi* (1781), made him an object of great dislike to both Queen and Court, and on May 12, 1781, he was suddenly dismissed. He retired to Geneva, and while living in retirement on his estate of Coppet he wrote his famous *Administration des finances*, published in 1784. He returned to Paris in 1787, but was soon banished on account of an attack which he published on the financial policy and management of Calonne. In the financial crises which followed upon the administration of Loménie de Brienne, Louis XVI. found himself under the necessity of calling Necker to the office of Director-General of Finances and Minister of State. This was in the summer of 1788, and Necker recommended the calling of the States-General, and thereby acquired his great popularity. When the Court, on June 23, 1789, determined upon nullifying the resolutions of the Third Estate, Necker seemingly objected and the King dismissed him on July 11th, and required him to leave the French dominions. He obeyed, but the disturbances of July 12th, 13th, and 14th, culminating in the storming of the Bastille, were the result of his dismissal, and the King was under the necessity of recalling him. On the rejection by the Constituent Assembly of his scheme of a loan, and the adoption instead of it of Mirabeau's scheme of assignats, he resigned his office in September, 1790, and again retired to Coppet, where he died, April 9, 1804. Necker was able and honest, but he was

a business man rather than a statesman. His daughter was the celebrated Madame de Staël (q.v.). A complete edition of Necker's writings, edited by his grandson, August de Staël-Holstein, was published in 15 volumes (1820-21). Consult also: Mme. de Staël, *La vie privée de M. Necker* (Paris, 1804); Nourrisson, *Trois révolutionnaires: Turgot, Necker et Bailly* (2d ed., ib., 1886); Gomel, *Les causes financières de la révolution française: les ministères de Turgot et de Necker* (ib., 1892); Hermann, *Zur Geschichte der Familie Necker* (Berlin, 1886).

NECKER, SUZANNE (CURCHOD) (1739-94). The wife of Jacques Necker (q.v.), born at Crassier in the Swiss Canton of Vaud. Her father, a Protestant minister, gave her an excellent education. She was at one time engaged to Gibbon, the historian, but after her father's death she went to Paris, and there met Necker, then a wealthy banker, who married her in 1764. Under her influence, Necker entered public life, and became the Finance Minister of Louis XVI. She herself founded a hospital in Paris, which still bears her name, and she wrote a number of books, including: *Réflexions sur le divorce* (1794); *Des inhumations précipitées* (1790); and five volumes of miscellanies, which appeared after her death (1798 and 1802). Consult: D'Arvor, *Madame Necker, 1737-94* (Paris, 1897); and D'Haussonville, *Le salon de Madame Necker* (Paris, 1882).

NECKER DE SAUSSURE, de sô'sur', ADRIENNE ALBERTINE (1766-1841). A French author, born in Geneva. She was the daughter of the naturalist Saussure, and married Jacques Necker the botanist, and nephew of the French statesman of the same name. Her cousin, Mme. de Staël, was credited with the translation (1814) of Schlegel's *Vorlesungen über dramatische Kunst und Litteratur* (1809-11), now known to have been written by Mme. Necker herself. The book on which her reputation rests is *L'éducation progressive, ou étude sur le cours de la vie* (1828-32), for which the Academy gave her the Montyon Prize in 1832. It is a pedagogical work, treating of the importance of child-training, in the preparation for after life.

NECK-MOLDING. A molding at the junction of the capital and shaft of a column. It is also called *neck* or *necking*, as in the case of the plain space between the astragal of the shaft and the moldings of the cap of the Doric order.

NECROMANCY (Lat. *necromantia*, from Gk. νεκρομαντεία, *nekromanteia*, from νεκρός, *nekros*, corpse + μαντεία, *mantēia*, divination). A method of divination by which the dead were supposed to be conjured up and to answer questions concerning the future. Its practice was certainly extremely ancient. It was condemned in the Old Testament, and among the Greeks it was familiar in Homer's day. In historical days necromancy was practiced by priests or consecrated persons at many shrines in Greece. It was also current among the Romans, although banned by the Church under Constantine. It was also employed by the northern peoples, and in the mediæval and later period passed over into sorcery. See SPIRITUALISM.

NECROPOLIS (Neo-Lat., from Gk. νεκρόπολις, *nekropolis*, cemetery, from νεκρός, *nekros*, corpse

+ πόλις, *polis*, city). A term originally applied to the cemeteries in the vicinity of ancient cities, and in particular to a suburb of Alexandria largely devoted to the reception and embalming of the dead. The term necropolis is now, however, used in a much more extended sense, and applied to any extensive burial-region of ancient date. The most remarkable of these are in Egypt, where they extend for miles along the left bank of the Nile. The Pyramids are the most conspicuous features of the Ghizeh necropolis; the 'Valley of the Kings,' near Thebes, the necropolis of El-Kab, and those of Beni Hassan and Abydos are other examples. In Africa the extensive necropolis of Cyrene; in Italy the ancient Etruscan tomb-groups of Vulci, Tarquinii, and Capua, distinguished for their painted tombs; the remarkable necropolises of Myra and Antiphellus in Lycia, and that of Petra in Syria are among the important examples belonging to classical antiquity. The extraordinary collection of domed and minareted tombs and sepulchral mosques in Cairo, known as the Karafah (tombs of the Khalifs), and dating from the twelfth to the fifteenth century, is often and justly called a necropolis; but the term is seldom applied to either mediæval or modern cemeteries. The burial places of antiquity have been especially important sources of archaeological discovery, owing to the universal custom in early ages of burying, with the deceased, utensils, arms, money, and jewelry, for his use in the nether world.

NECROSIS (Lat., from Gk. νέκρωσις, *nekrosis*, a killing, deadness, from νεκρός, *nekros*, to kill, from νεκρός, *nekros*, corpse). A term employed to denote the absolute death of a circumscribed portion of any tissue. Specifically, in surgery, it is applied to the death of a bone, wholly or in part. The dead portion separates from the surrounding healthy tissue by an inflammatory process, the cast-off part being known as the *sequestrum*, and the boundary between the living and dead tissue as the *line of demarcation*. Bony necrosis is due usually to direct injuries, inflammations, and infections, which attack either the periosteum (the membrane covering the bone) or the marrow, the immediate cause being interference with the circulation and nutrition. Necrosis of the soft parts is termed *gangrene*, and the dead portion, known as the *slough* or *sphacelus*, separates in the same way as in bone, by a line of demarcation. See GANGRENE.

NECTANEBO, or **NECTANEBUS**. The name of two kings of Egypt. NECTANEBO I. (Egyptian *Nakht-Hor-hebt*), the Νεκτανέβης (*Nektanēbēs*) of Manetho, was the first King of the Thirtieth Dynasty, and reigned from B.C. 382 to 364. The native monuments give little historical information in regard to his reign, but the accounts of Greek writers, especially Diodorus, show that he was a capable and energetic monarch. In the earlier part of his reign he supported Evagoras, King of Cyprus, against the Persians, and when the latter invaded Egypt, succeeded in repelling them, aided by an inundation of the Nile. Nectanebo endeavored to restore the old sanctuaries of the land, and he built or restored temples in many parts of Egypt. His stone sarcophagus, inscribed with religious texts, is in the British Museum. He was succeeded by TEHER or TACHUS, after whom NECTAN-

NEBO II. (Egyptian *Nakht-nebof*), the *Nekræβs* (*Nectanebos*) of Manetho, reigned from B.C. 361 to 343. He was a great builder. For a long time he repulsed the attempts of the Persians to conquer Egypt, but they finally made themselves masters of the Delta, and Nectanebo fled to Ethiopia. He was the last native King of Egypt. After his flight, Egypt was subject to Persian rule until B.C. 332, when it came into the possession of Alexander the Great. Consult: Wiedemann, *Geschichte Aegyptens von Psammetich I. bis auf Alexander den Grossen* (Leipzig, 1880); Budge, *A History of Egypt* (New York, 1902).

NECTAR (Lat., from Gk. *néktar*, *nektar*). In Greek mythology, the drink of the gods, as ambrosia is their food. In the *Iliad* only nectar is mentioned as the nourishment of the gods, and originally both words seem to have been used without distinction. Consult Roscher, *Nektar und Ambrosia* (Leipzig, 1883), though his identification of them with honey is open to grave doubts.

NECTAR. The sweet secretion formed by glands located on various parts of a plant, but especially in the flower. Sometimes it is called honey, but honey is nectar after partial digestion in the crop of insects, such as bees or wasps. See **NECTARY**; **GLAND**.

NECTARINE. A smooth-skinned stone fruit. See **PEACH** and **Colored Plate of DRUPES**.

NECTARY. A surface gland which secretes nectar (q.v.). The name is also applied to abortive floral organs (see below). Nectaries are most common in the flowers of seed plants, but are found also in regions remote from the flower (Fig. 1). Extra-floral nectaries are found on

FIG. 1. EXTRA-FLORAL NECTARY OF THE BRACKEN FERN. a, diagram showing location of gland in the axil of a leaflet; b, section showing the secreting cells beneath a stoma. (After Lloyd.)

the leafstalks and at the base of the leaf-blade, upon stipules and other portions of the leaf-base, and more rarely upon the blade itself.

The forms of nectaries are very various. The secreting surface frequently covers a more or less pronounced swelling or cushion of tissue, which may develop on the base of the flower leaves, or on the axis of the flower between them. Sometimes a nectary stands in the place where in other related flowers well-formed and functional floral organs stand. This fact has led to the application of the term nectary to abortive floral organs

even when they do not secrete nectar. Sometimes the nectar gland forms a continuous ring about the base of the pistil. In other cases the nectar gland lines the concave surface of depressions in the floral organs or the floral axis. When these pits deepen they constitute efficient receptacles for the secreted nectar. Thus, spurred petals and sepals are often furnished with nectar glands on the inner side or at the base of the spur, and the whole cavity may become filled with their secretion. Nectar glands sometimes line deep and narrow pits of small capacity, opening at the surface by a pore or cleft from which the nectar oozes. These passages may be branched, so that a complex gland is formed, such as is found in the pistils of some lilies (Fig. 2).

Nectar varies greatly in composition in different plants. The greater part of it is water, which is withdrawn from the gland cells by the osmotic action of the sugar. (See **SECRETION**.) In addition to sugars (glucose and saccharose) small amounts of proteids and various other carbon compounds give the peculiar odor and flavor to the nectar. Nectar is eaten by bees, wasps, butterflies, and other insects, which in their search for it are utilized as unconscious carriers of pollen. See **POLLINATION**.

NEDJED, *něj'd*, or **NEJD**. A region of Arabia, lying between latitudes 24° and 27° N., and bounded by El-Hasa on the east and Hedjaz on the west (Map: Asia, D 6). It has a hilly surface, intersected by many streams, which dry up during the summer. The climate is healthful. Politically Nedjed is a dependency of Jebel-Shammar. The inhabitants are Wahabis.

NEEDFIRE. In folk-custom, a fire kindled by the friction of two sticks of wood or of a rope on a wooden stake to ward off demons of disease. Among the many customs and beliefs connected with fire one of the most important is that of ritual purification. This idea arose at an early stage of man's acquaintance with fire from a simple observation of the effects of flame, the most mysterious phenomenon which he knew. Later, fire was differentiated into a number of varieties partly good and partly evil with regard to position and use, thus implying that all flame was not equal in efficacy. Still further it was thought that by age or contamination fire became ineffective and must be renewed, hence the kindling of new fire, which was an accompaniment of widely diffused cults, as that of Thor in Scandinavia and of nature gods in ancient Mexico. The new fire is supposed to regenerate, as fire sacrifice is designed to sustain, the invisible beings. Needfire is a practice usually of shepherd peoples to ward off disease attacking the flocks. In historic times the sparks for kindling the needfire were sometimes obtained by twirling a wooden peg around in a wooden

FIG. 2. SEPTAL NECTARY FROM FRUIT OF DAY-LILY.

The columnar cells lining the tube are the secreting cells.

post. As in the case of new fire, the needfire was almost always accompanied with the extinguishing of the fires of the locality and the neighbors also rekindled their fires from it as in the new fire ceremony. In practice the people passed or the herds were driven through or between the flames of the needfire for purification. The needfire custom survived well into the nineteenth century, and it is probable that traces of it still exist in parts of Europe.

NEEDHAM, JOHN TURBERVILLE (1713-81). An English naturalist, born in London. He studied at Douai, and was ordained to the priesthood in 1738. In 1769 he became director of the Academy of Sciences of Brussels. Needham was a friend of Buffon, and in his time well known as a scientist. His great 'discovery' was that all life proceeds from vegetation; it is contained in his *Observations upon the General Composition and Decomposition of Animal and Vegetable Substances* (1749), and *Nouvelles observations microscopiques* (1750).

NEEDHAM, or **NEDHAM**, MARCHAMONT (1620-78). An English journalist and pamphleteer, born at Burford, Oxfordshire. He was educated at All Souls' College, Oxford, and after studying medicine and law turned to journalism, and founded in 1643 the *Mercurius Britannicus* (*sic*), to which he was frequently the sole contributor. The boldness of his scurrilous attacks upon Charles I. led to his incarceration in the Fleet Prison in 1645 and in 1646, but the following year he became a Royalist himself and began the publication of *Mercurius Pragmaticus*, wherein he defended the King and turned his venomous pen against the Scots and Oliver Cromwell. Afterwards he rejoined the popular party, and signalized his conversion by the publication of *The Case of the Commonwealth of England Stated* (1650). After the Protector's death he went to Holland and continued the publication of his abusive pamphlets, such as *A Short History of the English Rebellion, Completed in Verse* (1661), and *Christianissimus Christianandus; or, Reasons for the Reduction of France to a More Christian State in Europe* (1678).

NEEDLE (AS. *nædl*, Goth. *nēala*, OHG. *nādela*, *nādla*, Ger. *Nadel*, from OHG. *nājan*, Ger. *nāhen*, to sew; ultimately connected with OIr. *snáthad*, thread, AS. *snear*, Eng. *snare*, Lat. *nere*, Gk. *νεῦν* *neein*, to sew). An instrument of metal, or other material, used to carry the thread in sewing, embroidering, knitting, netting, and other similar operations. Needles are generally made of metal, but bone, ivory, and wood are also used; for ordinary needlework, called sewing, they are made of fine steel, and are too well known to need description; for other kinds of work they are often much larger and differently formed. The earliest needles were not pierced, but were like awls, and were used for making holes in skins, through which the long roots of plants or leather thongs were passed. Later, a hole was bored in one end of the stone or bronze needle through which the root or thong was passed and this was dragged through the leather as it was punched. Stone needles, with a hole in the end opposite the point, are found in the remains of the Stone Age. Bone needles with eyes are found in the reindeer caves of France and lake dwellings of Central Europe. The needles that have come down to us from ancient Egypt are very

coarse, but finer needles must have been made to execute the delicate embroidery that was produced by that people. The ancient Greeks must have been skilled in needlework, judging from the descriptions of embroidery in Homer. Ordinary needles and surgeons' needles have been found in the ruins of Pompeii.

The Chinese are believed to have been the first to use needles of steel, and these implements gradually found their way westward until they were brought into Europe by the Moors. By 1370 the needle-making industry was established in Nuremberg. In England it was not until the reign of Queen Elizabeth that their manufacture was taken up on any considerable scale in small shops, and after 1650 it gradually developed until the greater part of the hand-sewing needles are now made in England. Subsequent developments included the introduction of the needle with the eye and the gradual development of machines for their manufacture. The first drill-eyed needles were made in 1826.

Needle-making is an important industrial art, and it has attained to extraordinary perfection. The first operation, after the wire has been selected and its thickness accurately gauged, is to cut it into eight-foot lengths; this is done by winding it in a coil of sixteen feet circumference, and then cutting this coil into exact halves with powerful cutting shears. The coiling of the wire is so managed that there are 100 pieces in each half when cut; the bundles of 100 wires are again cut into the necessary lengths for two needles. The pieces cut from a coil, although now reduced to the length of two small needles, are nevertheless somewhat curved; they are therefore collected into bundles and placed in two iron rings, which hold them loosely together; they are then slightly softened by firing, and are laid on an iron plate or bench, and are pressed with a small curved bar in two or three positions, by which the operator manages to make them all perfectly straight. The blanks after being removed from a hopper in regular succession are next pointed at both ends by a grindstone to whose face they are held by a rubber band.

The eyes are next punched by means of dies. (See **DIES** AND **DIE-SINKING**.) The blanks or double needles are now placed on two wires and the two sets broken apart to form separate needles. The roughly formed needles still have to be polished, tempered, and have the heads ground into shape, operations which are mechanically performed.

Besides the ordinary sewing needle already described and other hand needles—such as those used in sail-making, leather work, upholstery, and surgery—many forms of sewing-machine needles are manufactured. The most familiar of these is the needle used in the domestic sewing machine, with the point in the eye and grooves on each side to protect the thread from being worn or cut in passing through the fabric. The latched needles used in stocking machinery are very delicate pieces of mechanism, as the latch is held by a rivet about $\frac{1}{16}$ inch in diameter between walls which are no thicker. For leather-sewing machines the needles must be adapted for use with waxed thread, and often are made with a hook at the end, instead of a hole; while the welting-machine needle, for sewing welts in boots and shoes, is the shape of a segment of a circle.

NEEDLE-FISH, PIKES, ETC.

1. HALFBEAK (*Hyporhamphus unifasciatus*).
2. SAURY (*Scomberesox asotus*).
3. FLYING FISH (*Exocoëtus volitans*).
4. SHARP-NOSED FLYING FISH (*Podiatator acutus*).
5. NEEDLE-FISH or HOUNDFISH (*Tylosurus acus*).
6. PIKE (*Esox lucius*).
7. POND PICKEREL (*Esox reticulatus*).

Hand needles are largely made in Germany and England. Aix-la-Chapelle is the centre of the industry in Germany, and it is said that the factories of that city alone produce 50,000,000 weekly.

Needles for use in various machines are made in the United States, especially those for the ordinary domestic sewing machine. At first these needles were made by processes similar to those employed for making ordinary hand-sewing needles, but gradually special machinery has been invented for their manufacture. The process is essentially as follows: The wire is cut into a blank, which is then reduced and pointed, grooved, has its eye punched, is hardened and tempered, hard burr dressed, brass brushed, has its eye polished, undergoes a first inspection, is hard straightened, and then receives the final pointing. In one method of making sewing-machine needles by machinery the crucible steel wire from which the needle is formed is first straightened and then fed into a machine which makes the large end of the needle and cuts off the blanks of the lengths required. These blanks after being ground and polished with emery wheels and an emery belt pass from a hopper on to a grooved endless traveling carrier, where the shank of the needle is formed by the grinding action of an emery wheel. By successive wheels the needles are ground and pointed and then grooves are cut by steel saws and the eyes punched. They are then heated and hardened and cleaned first by emery and then by wire brushes and burnishing powder applied from a bristle brush. The final pointing is done on a fine emery wheel and the last polishing is accomplished with crocus and alcohol. A second method differs from that just described in that the steel wire is cut into blanks of about one-third the length of the finished needle. After a thorough cleaning these blanks are fed from a hopper into a machine where they are acted upon by steel dies which compress and extend the blank. This process is known as swaging and produces needles which vary slightly in length. This defect, however, is remedied by the action of a clipping and straightening machine which reduces the needles to a uniform size.

STATISTICS. According to the *United States Statistical Abstract* for 1900 the value of the needles imported into the United States is as follows: 1891, \$314,033; 1892, \$337,272; 1893, \$369,465; 1894, \$278,101; 1895, \$291,026; 1896, \$312,298; 1897, \$309,754; 1898, \$362,606; 1899, \$407,746; 1900, \$367,568. According to the Twelfth United States Census, 1,120,532 gross of needles were manufactured in the United States in 1900. The total value of this product is given as \$1,027,949, which is distributed as follows: Latch knitting-machine needles, 276,141 gross, valued at \$414,504; common household sewing-machine needles, 324,476 gross, valued at \$399,252; wax-thread sewing-machine needles, 212,649 gross, at \$99,533; knitting spring needles, 307,266 gross, at \$114,660. In addition, about 277,000 gross of needles, valued at \$327,000, are annually produced incidentally in factories not specially engaged in their manufacture in connection with other industries. It will be noticed that this list does not include common hand sewing and darning needles, crochet, tape, and hand-knitting needles, and it appears that none of these varieties were included in the 1900 census returns of manufactures in the United States.

VOL. XIV.—22.

Consult article on "Needles and Pins," in *Twelfth Census of U. S.*, vol. x., Manufactures, part iv. (Washington, 1902).

NEEDLEFISH (so called from the shape of the snout). A gar-like fish of the syngnathous family Esocidae, and especially of the genus *Tylosurus*. They are slim, long-jawed, voracious, carnivorous fishes found in all warm seas, and sometimes entering rivers. Their habits are ordinarily much like those of a pike. (See Plate of **NEEDLEFISH**, **PIKES**, ETC.) Their flesh is good. Some species are numerous on the South Atlantic and Gulf coasts, where they are confounded with the true gars, under the names 'garfish' and 'bill-fish' (especially *Tylosurus marinus*), and are also called 'aguja' (q.v.), 'long-jaws,' 'hound-fish,' and 'guardfish.' Consult Jordan and Forde, *Proceedings of the United States National Museum* for 1886.

NEEDLE GUN. See **SMALL ARMS**.

NEEF, náf, or **NEEFS**, náfs, PIETER, the Elder (c.1580-c.1661). A Dutch architectural painter. He was born at Antwerp, and was there a pupil of Hendrick van Steenwyck. His numerous architectural paintings usually represent church interiors illuminated with the glow of torches or of candles. His treatment was delicate, refined, and extraordinarily clear; he understood the harmonious modulation of colors and the power of chiaroscuro, but he generally intrusted the painting of the figures introduced into his pictures to Teniers, Franks, Breughel, and Van Thulden. His works are to be found in the galleries of Dresden, Vienna, Paris, and Gotha.

NEELE, nêl, HENRY (1798-1828). An English writer, born in London. He was admitted to the bar, and practiced as a solicitor. From the successful appearance of his *Odes and Other Poems* (1817), printed during his clerkship, he was a busy contributor to various journals and the annuals. In 1827 he gave first at the Russell Institution, and later at the Western Literary Institution, his *Lectures on English Poetry*, extending from Chaucer to Cowper. His most important publication was the *Romance of English History* (3 vols., 1827), a collection of stories based on occurrences in each reign from the Conquest to the Reformation, marred by a stilted style and historical inaccuracies. In the same year his poems were gathered in a two-volume edition. His verse has no higher qualities than spontaneity and ease. His stories, at their best, are marked by considerable imaginative skill. His *Literary Remains*, including the *Lectures*, appeared posthumously (1829), with a memoir. The *Winter Nights* (London, 1820) of Nathan Drake contains (No. xiii., vol. ii.) "Critical Observations" on the *Odes and Other Poems*, associating Neele with Chatterton and Kirke White.

NEENAH, nē'ná. A city in Winnebago County, Wis., 14 miles north of Oshkosh, the county-seat; on the Fox River, at the outlet of Lake Winnebago, and on the Chicago and Northwestern, the Chicago, Milwaukee and Saint Paul, and the Wisconsin Central railroads (Map: Wisconsin, E 4). It is an attractive summer resort, well known for its fishing, and has a public library, a handsome opera house, and several public parks, the most notable being Riverside Park. The river, which affords fine water

power, divides, as it leaves the lake, into two streams, inclosing a large island, half of which belongs to Neenah and half to Menasha, the two cities forming practically one industrial community. Manufacturing enterprises are well developed and include paper, lumber, and flour mills, stove works, foundries and machine shops, brick works, a boot and shoe factory, etc. Settled in 1846, Neenah was incorporated in 1850 as a village, and in 1873 was chartered as a city. The government, under a charter of 1883, is administered by a mayor, chosen every two years, and a unicameral council. The municipality owns and operates the water-works. Population, in 1890, 5083; in 1900, 5954.

NEER, nār, AART VAN DER (1603-77). A Dutch landscape painter, born at Amsterdam. He was a friend of Albert Cuyp, who occasionally supplied the figures and animals in his pictures, which were for the most part moonlight scenes, depicted with a prevailing warm tone. At times he represented the same scenes, usually towns or groups of cottages on the banks of a canal or river, under the effect of sunlight. Fine specimens of this kind are in the National Gallery, London, in the Louvre, and in the Metropolitan Museum, New York. Three remarkable examples of his conflagration effects, which he depicted with great truth, are in the Berlin Museum, which, besides four other examples of his work, contains one of his most effective moonlight pieces. Among the best of the latter variety are two in the Dresden Gallery and one in the Vienna Museum. The warmth and glow of his coloring extend even to his winter landscapes, which may be seen to best advantage in the museums of Amsterdam and Brunswick. He died at Amsterdam, November 9, 1677.

His son, EOLON HENDRIK VAN DER NEER (1643-1703), a genre and landscape painter, was born at Amsterdam. He was at first instructed by his father, who, on his showing preference for figure painting, placed him under Jakob van Loo. From 1663 on he spent about three years in France, then lived successively in Rotterdam, Amsterdam, and Brussels, and in 1687 became Court painter to the Elector Palatine at Düsseldorf, where he died on May 3, 1703. His favorite subjects were single figures, especially ladies in elegant attire, engaged in domestic occupations, in the manner of Terborch and Netscher, with whom the fine taste shown in his compositions, and pervading all details, entitles him to be ranked. A harmonious example of this kind is a "Lady Tuning Her Lute" (1678), in the Pinakothek at Munich. Similar pictures are in the Rotterdam Museum (dated 1669), and in the galleries at Karlsruhe (1677) and Dresden. Occasionally he painted, but less successfully, biblical subjects, such as "Tobias with the Angel" (1690), in the Amsterdam Museum, and later also landscapes, taking Elsheimer for his model. Two examples of these (dated 1697) are in the Uffizi Gallery at Florence, which also contains the artist's portrait (1696).

NEERWINDEN, nār'vin'den. A village of Belgium, in the Province of Liège, five miles southeast of Tirlemont, celebrated in history for the great victory gained by the French under the Duke of Luxembourg over the English and Dutch under William III. (July 29, 1693). It was also the scene of the defeat of the French under

Dumouriez by the Allies under the Prince of Coburg (March 18, 1793).

NEESIMA, nē'shī-mā, JOSEPH HARDY (1845-90). A Japanese educator, born in Yedo, of a good samurai family. He received an excellent education and went to Boston, where he found a patron in Alpheus Hardy. He graduated at Amherst College and at Andover Theological Seminary. Returning home in 1874, with funds obtained from friends of the American Board of Foreign Missions, he succeeded in carrying out his educational plans. His college in Kioto, the Doshisha, became the largest and best equipped Christian institution in the Empire.

NEES VON ESENBECK, nās fōn ā'zen-bēk, CHRISTIAN GOTTFRIED (1776-1858). A German botanist and naturalist. He was born at Erbach in the Odenwald; studied medicine at Jena, and in 1818 became professor of botany at the University of Erlangen. He subsequently was professor of botany at Bonn, and in 1830 accepted the posts of professor of botany and director of the botanic garden at Breslau. In 1848 he went to Berlin and took an active interest in the agitations of that and the following year. His deposition from the chair of botany in 1852 was the consequence of his political activity. In his *Handbook of Botany* (1821), he developed the theory advanced by Goethe in his *Metamorphose der Pflanzen*, that all the parts of the flower are only variations of the leaf. This work had been preceded by *Die Algen des süßen Wassers* (1814); by *Das System der Pilze und Schwämme* (1816); and by *Substanz der Pflanzen* (1819), in which he was assisted by Rothe and Bischof. He published, in 1833, *Genera et Species Asteracearum*; in 1836, *Systema Laurinarum*; and in 1841, *Flora Africa Australiaris Illustrationes Monographicae*. In 1852 appeared the first volume of *Die allgemeine Formenlehre der Natur*. He was a specialist on cryptogamous plants, and in this branch of botany his chief work is *Naturgeschichte der europäischen Lebermoose* (1833-38).

NE EXEAT (Lat., let him not go out). A writ or order issued by a court of equity, directed to a sheriff and commanding him to arrest the defendant in an action and detain him until he furnishes a certain bail, on condition that he will not leave the jurisdiction without permission of the court. About the time of Queen Elizabeth, this writ came to be employed by the Court of Chancery to restrain a person who was under some equitable obligation to another from leaving the country. This practice became common in England, and was adopted into equity or chancery practice in the United States, where it still obtains in many States.

This equitable remedy of *ne exeat* corresponds in its purposes to the legal process of arrest and bail in civil cases, and has been abolished by some modern codes of procedure, as in New York, and the legal remedy substituted in its stead. See ARREST; BAIL; EQUITY. Consult the authorities referred to under EQUITY; PROCEDURE; WRIT.

NEF, JOHN ULBIO (1862—). An American chemist, born at Herisau (Appenzell), Switzerland. He graduated at Harvard University in 1884, held a fellowship there in 1884-87, studied also at Munich (Ph.D., 1886), and in 1887-89

was professor of chemistry in Purdue University (Lafayette, Ind.). In 1889-92 he was assistant professor of chemistry and acting director of the chemical laboratory in Clark University (Worcester, Mass.), in 1892-96 was professor of chemistry in the University of Chicago, and in 1896 became head of the department of chemistry in that institution.

NEGAPATAM, *nēg'a-pa-tām'*. A seaport city on the Coromandel coast, in the district of Tanjore, Madras, British India, and the terminus of a branch line from Tanjore, 48 miles to the west (Map: India, D 6). It has regular steamer communication with Ceylon, Burma, and the Straits Settlements, and carries on an active trade exporting rice and paddy, and importing cotton goods and betel nuts. The extraction of oil from cocoanuts and oil seeds is an important industry. The extensive building and repairing plant of the Great Southern Railway of India is located here. Negapatam was one of the earliest Portuguese settlements on the Coromandel coast; it was taken by the Dutch in 1660, and was the capital of their Indian possessions until captured by the English in 1781. Population, in 1891, 59,221; in 1901, 57,190.

NEGATIVE (from Lat. *negativus*, negative, from *negare*, to deny, from *nec*, not + *aiere*, Skt. *ah*, to say, Gk. *ἔμει*, I say). A photographic picture in which the lights and shades of the object are reversed. A negative is usually produced in a camera by the action of light upon the sensitized surface of a glass plate, celluloid film, or paper. (See PHOTOGRAPHY.) When the plate is developed, the portions most affected by the light receive the densest deposits, and are rendered nearly if not quite opaque, while the portions corresponding to the shadows appear transparent. A good negative should show the gradations of light and shade, and should be distinct in all its detail. The presence of as many tones, or values of light and shade, as possible, is desired, while at the same time the high lights and shadows must be marked. The production of a good negative, outside of questions of the preparation of the plate or film, depends chiefly upon a proper length of exposure and successful development. A negative is used for making positives by contact printing or with an enlarging or copying camera. For contact printing the negative is placed film side upward in a printing frame, and on it is laid a sheet of sensitized paper with its coating next to the film. The printing frame is then exposed to the light and the rays passing through the clear or transparent portions of the negative affect the paper beneath, while those portions beneath the dark or opaque parts of the negative are protected and remain white. In this way a large number of positives or correct reproductions can be obtained from one negative.

NEGATIVE QUANTITY. The inverse operations of mathematics, such as subtraction, division, and evolution, often lead to results which cannot be expressed in terms of the same unit as the numbers entering the operation. The interpretation of these results leads to the so-called artificial numbers, and in the particular case of subtraction to the notion of negative number. For example, $\$2 - \$3$ is impossible if the result is to be expressed in terms of the positive unit \$1, but, since the result of subtraction is

the number which added to the subtrahend will produce the minuend, it is easy to see that the number which added to \$3 will make \$2 must be equivalent to the number which subtracted from \$3 will make \$2. In other words, instead of subtracting \$1 from \$3 to reduce it to \$2, a number must be added which will produce the same result. Such a number is called a negative number and is designated by the sign—placed before it. Hence $\$2 - \$3 = -\$1$. This notion of negative number as the opposite of positive number, and apparently growing out of an arbitrary interpretation of a mathematical process, has its counterpart in concrete magnitudes opposed in function or extent. For example, in the above case, if a man's assets are \$2 and his debts \$3, the number expressing his financial status is \$1 of indebtedness, which may be expressed by $-\$1$. Similarly, time A.D. is often expressed by positive numbers, and time B.C. by negative numbers. In astronomy north latitude is expressed by positive numbers and south latitude by negative numbers; west longitude is designated as positive and east longitude as negative. Such extensions of the meaning of signs and modes of operation are the natural outgrowths of a constantly progressive science. The introduction of the negative number doubles the number space of arithmetic by adding an infinite series of numbers opposite in meaning and having a 1 to 1 correspondence (see CORRESPONDENCE) with the series of positive numbers.

The negative quantity enters geometry through the phases of motion and direction. For example, the segments AB, BC, and CD, of a horizontal straight line AD thought of as extending to the right are considered positive, but the segments DC, CB, and BA thought of as extending to the left are considered negative. Similarly, many writers regard all angles generated by a line revolving counter-clockwise about a point as positive and those generated by a clockwise motion as negative. The introduction of negative quantities into geometry, especially in connection with the theory of continuity (see CONTINUITY), has greatly increased the power and scope of the subject.

The meaning of negative quantities as employed in the physical sciences may be illustrated from elementary mechanics. A material point confined to a horizontal straight line may move to the right, remain stationary, or move to the left. The first condition may be expressed by a positive velocity toward the right, the second by a zero velocity, and the third by a negative velocity.

By analogy to mathematical usage, the positive and negative notation is sometimes applied to quantities measured by scales like those of the ordinary thermometers, on which an arbitrary point is denoted as the zero-point and all degrees below zero are denoted by negative numbers. Such conventional notations are convenient, but not always well founded. Thus, the temperature -1°C. is not the physical opposite of $+1^{\circ}\text{C.}$; the two temperatures would be the physical opposites of each other only if 0°C. represented a state in which bodies would have no heat at all, and if it were possible that a body should have less than no heat. On the other hand, in the case of physical magnitudes whose character, like that of electricity, may be dual, the positive and

negative notation has again a definite natural meaning.

Negative quantities have been thoroughly understood only within recent times. Although Hero of Alexandria in his *Stereometrika* considered the expression $\sqrt{81-144}$ as possible, the result is recorded as $8-1/16$, which shows that negative quantities were not understood by the Greeks. The Hindus were more successful, for Aryabhata, c.530, distinguished between *dhana* (assets), positive quantities, and *kshaya* (liabilities), negative numbers. Bhaskara, c.1150, was aware that a square root can be both positive and negative, and that $\sqrt{-a}$ does not exist for the ordinary number-system. Al-Khuwarizmi, c.830, a celebrated mathematician under the Arab supremacy, obtained two roots for the quadratic equation, but the negative roots were rejected as not valid. Among the early European mathematicians, Fibonacci (1202) went no further than the Arabs. Paccioli (1494) definitely stated the rule, *minus times minus always gives plus*; but this fact was known to the Arabs and Hindus, Bhaskara, for example, having stated that the square of a negative number is always positive. Cardan (1545) recognized negative roots, but called them *æstimationes falsæ or fictæ*. Stifel (1544) called negative numbers *numeri absurdi*, and Harriot (1631) was the first to consider such a number capable of forming a member of an equation. Vieta (1591) distinguished between positive and negative numbers, and Descartes (1637) in his geometry used the same letter for both positive and negative quantities.

NEGAUNEE, né-ga'né. A city in Marquette County, Mich., three miles east of Ishpeming; on the Chicago and Northwestern and the Duluth, South Shore and Atlantic railroads (Map: Michigan, F 2). It is in the great iron region of the State, on a ridge called the 'iron mountain,' at an elevation of about 1400 feet, and has several productive iron mines within the municipal limits. Settled about 1870, Negaunee was incorporated in 1873, the charter of that year, as revised, now operating to provide for a mayor, annually elected, and a unicameral council. The water-works and electric light plant are owned and operated by the city. Population, in 1890, 6078; in 1900, 6935.

NEGLIGENCE (Lat. *negligentia*, from *negligens*, pres. part. of *negligere*, *neglegere*, to neglect, from *neg*, not + *legere*, to gather). The omission to do something which a reasonable man guided by those considerations which ordinarily regulate the conduct of human affairs would do, or doing something which such a prudent and reasonable man would not do. Such is a judicial definition of the term, which is quoted by legal writers and judges more frequently than any other. It assumes, what is often expressly stated in other definitions, that the thing omitted or done was in violation of a legal duty, and resulted in legal damage to the one to whom the duty was owed. The three elements to be considered, then, are: (1) proper care; (2) legal duty; (3) legal harm.

PROPER CARE. It will be observed that the standard of care recognized by the definition is that which a reasonable man would exercise in a given situation. Whether such care has been taken or not is generally a question of fact for

the jury. It is true that if the evidence is not conflicting—if the story of the plaintiff is the same as that of the defendant, and if, in the opinion of the court, reasonable men would draw but one inference from the evidence—the question of negligence will be decided by the court. Hence a court often nonsuits a plaintiff on the ground that his own evidence shows that the harm of which he complains was not caused by any negligent act or omission of the defendant. As a rule, however, the jury are to determine whether the defendant's conduct was reasonably prudent or not. At the same time, the court is bound to explain to the jury the legal rules bearing upon the subject, of which the most important are these:

When a person undertakes the performance of a task which requires special skill, the failure to do all that any skillful person could reasonably be expected to do in such a case, considering all the circumstances, will amount to actionable negligence. If an ordinary mechanic undertakes to clean or repair a watch, he is bound to do the work with the skill and care of the ordinary watch cleaner or repairer.

The law does not presume negligence on the part of any one, and throws upon him who alleges that another has been negligent the burden of proving it. Accordingly, a person who has been injured by a runaway horse, or whose property has been destroyed by a fire which started on his neighbor's land, must show, not only that the horse ran away or the fire started, but that it was through the owner's fault. At times, however, the situation of the parties when the injury occurs is such as to overcome the ordinary presumption of care on the part of the defendant. To such a situation the maxim is applied, *res ipsa loquitur*—"the thing speaks for itself." A railroad train jumps the tracks; a case of goods falls out of a warehouse window; or a peck of live cinders is thrown out of a railroad engine of an elevated road upon a traveler in the street below; in each case we have a situation which would not exist, ordinarily, had the railroad company or the warehouseman exercised ordinary care. Hence the presumption of due care on his part is overcome, and judgment will pass against him unless he can show that, notwithstanding these appearances, he was really without fault.

Another important rule is that the amount of care required varies with the apparent risk. One sets fire to brush or rubbish upon his premises and the fire spreads to his neighbor's land, doing damage and hurting another. Whether he acted negligently will depend upon various circumstances, such as these: Was the weather dry or damp? From what direction and with what velocity was the wind blowing? What vigilance and effort did he exercise in trying to keep the fire on his own land? Again, without warning, one throws an article from a scaffold to the ground, hitting and hurting another. Whether he acted negligently will depend upon the apparent risk incident to the act. If the scaffold was adjoining a city street and the article was thrown into the thoroughfare, the act would be clearly negligent. On the other hand, if the scaffold overhung private premises, and there was no reason to believe that other persons were present, the act would be careful.

In some cases the courts are disposed to hold

persons liable for harm caused by their acts or omissions, whether these are negligent or not. The doctrine was laid down by an eminent English judge as follows: "The person who for his own purpose brings on his land, and collects and keeps there, anything liable to do mischief if it escapes, must keep it at his peril, and, if he does not do so, is *prima facie* answerable for all the damage which is the natural consequence of its escape. He can excuse himself by showing that the escape was owing to the plaintiff's default, or was the consequence of the act of God." This view has not been adopted to any extent in the United States, the courts preferring the rule that one who brings dangerous agencies upon his land or under his control is not an insurer of the safety of others, but that he is bound to exercise a care over them commensurate with the apparent risk in each case.

The terms gross negligence, ordinary negligence, and slight negligence are often used, although the modern tendency is to discard them. When employed, the first represents the extreme of negligence—a want of care amounting almost to recklessness; the second is the absence of such care as an ordinarily prudent man exercises; and the third stands for the lack of care required of one who is doing a favor to the injured party, such as keeping his property gratuitously.

LEGAL DUTY. Passing now to the legal duty of exercising care, it should be borne in mind that this is relative, not absolute; and consequently, when it has no existence between particular parties, there can be no such thing as negligence in the legal sense of the term. In other words, a man may be very careless without being negligent. To illustrate: the owner of a sugar orchard left a bucket of hot maple syrup uncovered in his woods. A neighbor's unruly cow jumped the fence, wandered into the woods, and died from drinking the syrup. Leaving the syrup thus was careless so far as protecting it from harm was concerned; but it was not negligence toward the owner of the cow, for the owner of the syrup was under no legal duty to exercise ordinary care toward trespassers, and the act of the cow was a trespass (q.v.). Toward trespassers the duty of a landowner, a common carrier, or the like, is simply to refrain from inflicting willful or wanton injury. Toward a licensee, that is, one whom a person barely permits to be upon his premises or in his vehicle, the licensor owes some duty of care; but the amount of care is slight. As a rule the licensee takes the risk of the situation. There must be something like fraud on the part of the licensor before he can be held answerable for injuries sustained by the licensee in falling into unguarded excavations, or breaking through defective floors, staircases, pavements, or the like, or getting caught by unfenced machinery or being thrown from a collapsing carriage. The licensor is bound, however, not to open new excavations in or near a path which he knows licensees are accustomed to traverse, or to subject them to anything like man-traps or new and serious dangers without giving them warning. An ordinary guest is generally looked upon by the law as a mere licensee. Toward persons expressly or impliedly invited upon one's property in a matter of common interest, the inviter is under a

well-defined duty—the duty of making the property reasonably safe. He is not under an absolute duty to prevent harm, but only a duty to make the place as little dangerous as such a place would reasonably be, having regard to the ordinary exigencies of the business there carried on.

LEGAL HARM. Even when it is shown that the defendant has been guilty of negligence toward the plaintiff, the latter may fail in his action because he cannot show that he has sustained legal harm by such negligence. A striking illustration of this rule is afforded where one is made sick by a nervous shock due to another's negligence. Through the fault of a railroad company, for example, a car takes fire, and several passengers are so badly frightened that they faint and for weeks are confined to their beds by consequent sickness. According to the prevailing doctrine in England and in the United States, they have no cause of action against the company. Various reasons are assigned in its support. One is that such sickness is not the natural and probable consequence of the negligence; that it occurs only when there is an accidental or unusual combination of circumstances which could not have been reasonably anticipated by the defendant, and over which he had no control. Another reason urged is that to hold a defendant liable for mental anguish, or fright, or nervous shock, would cause an alarming increase in the volume of sham litigations. Every passenger in case of a railroad collision could allege fright or nervous shock and thus maintain an action against the company. In a few jurisdictions, however; mental anguish, even without consequent or attendant physical injury, is deemed legal damage. It is generally held that if the defendant's negligence causes injury to one's body, recovery may be had for the pain and suffering which are incident thereto.

Not only must the harm sustained by the plaintiff be of a character which the law deems it wise to recompense, but it must be, in contemplation of law, the natural and probable consequence of defendant's negligence. When negligence is to be deemed the proximate cause, and when the remote cause, is often a question of great difficulty. Ordinarily it is a mixed question of law and fact, to be submitted to the jury under proper instructions from the court, although, if the evidence is not conflicting, and the court thinks that but one inference can be drawn from it by reasonable men, it will decide the question itself. When the inquiry is sent to a jury, they are generally instructed that the proper test to be applied by them is: Was there an unbroken connection between the negligence and the injury? Did the facts constitute a continuous succession of events so linked together as to make a natural whole, or was there some new and independent cause intervening between the wrong and the injury? Applying this test, the plaintiff was beaten in the following case: Defendant, a railroad company, received a quantity of wool for transportation from Buffalo to Albany, N. Y., and for delivery there to another company for transportation to Boston, Mass. It was negligent in starting the wool on its journey, so that it reached Albany ten days later than it would but for such negligence. While in defendant's warehouse awaiting the call of the second carrier the wool

was injured by an extraordinary flood. It was held that the immediate and proximate cause of plaintiff's loss was the flood, and that defendant's negligence was too remote to render it liable. The latter had ceased to operate as an active or efficient cause before the flood came.

CONTRIBUTORY NEGLIGENCE. It is really on this ground (that defendant's negligence is not the proximate and efficient cause of one's injury) that the injured party is denied a recovery when he is shown to have been guilty of contributory negligence. A single example will suffice here: A workman is warned by his employer not to work upon a scaffold at a certain point because it has no railing there. He does work on that part, and, forgetting the absence of a rail, steps backward, falls, and is injured. Clearly, it is the workman's negligence, not the employer's, that is the decisive cause of his harm. But suppose, being there with knowledge of defendant's negligent omission of a railing, he had been knocked from the scaffold by the fall of an object from the roof, which fall was due to defendant's negligence. The servant's presence at the point in question would have furnished an opportunity for defendant's negligence to operate, but would not have been the cause of his injury, and he would recover.

It should be noted that contributory negligence on the part of a plaintiff is not an absolute bar to recovery in admiralty (q.v.) as it is at common law. It only diminishes his damages. Hence, whenever one has an option to sue at common law or in admiralty for the defendant's negligence, he should choose the latter jurisdiction.

CRIMINAL NEGLIGENCE. Negligence which is the proximate and efficient cause of the death of a human being may subject one to a criminal prosecution for manslaughter (q.v.), but at common law it does not render one liable in tort. The latter rule has been changed by statute both in England and in many of our States. While this legislation varies in different jurisdictions, its principal object is to grant a cause of action on behalf of those who were dependent upon or financially interested in the life of the deceased, against the one wrongfully causing his death. Consult: Beven, *Negligence in Law* (London, 1895); Shearman and Redfield, *Treatise on the Law of Negligence* (New York, 1898); Pollock, *The Law of Torts* (London and New York, 1901).

NEGOTIABLE INSTRUMENTS (ML. *negotiabilis*, from Lat. *negotari*, to negotiate, from *negotium*, business, from *nec*, not + *otium*, leisure). Contracts in writing which are transferable by indorsement or delivery, and which are enforceable by the transferee in his own name, without previous notice to the promisor, as well as without the risk of being met by defenses that would have been good against the transferor. Such contracts were unknown to the early common law of England. By that law a contract, whether written or oral, could not be transferred so as to enable the transferee to sue upon it in his own name. He was obliged to sue in the name of the transferor. Equity modified this rule to the extent of allowing an assignee of a contract to sue in his own name. But, even in equity, the assignment would not bind the promisor until he received notice of it, and after

notice he could set up all defenses against the assignee which were available to him against the assignor at the time of notice. In other words, the assignee could get no better title than the assignor had. Modern statutes have made nearly all contracts and rights of action assignable; that is, they permit the assignee to sue upon them in his own name, but he takes them and sues upon them subject to the defenses available against his assignor.

The negotiability of certain contracts is a characteristic impressed upon them by the usages of merchants. This quality was first recognized and made effective by the law merchant (q.v.), whose rules upon this were later adopted and enforced by the common law. Thus it has come about that for more than three centuries certain contracts in writing have been treated by all English judicial tribunals as negotiable, and have been contrasted with others which are only assignable. The earliest form of negotiable instrument recognized by English law was the foreign bill of exchange (q.v.). Next in order came the domestic or inland bill of exchange, differing from the foreign bill only in the fact that it was drawn and payable within the same State or political jurisdiction. Following this came the promissory note (q.v.), but its negotiable character was not established without a struggle. It is true that the negotiability of this novel mercantile instrument passed unchallenged for a time in England, but after Lord Holt became Chief Justice he set his face against the recognition of new forms of negotiable instruments and decided that promissory notes were not negotiable. Immediately the merchants of London appealed to Parliament, and that august body enacted a statute without delay, upholding the mercantile view and declaring promissory notes negotiable like bills of exchange (3 and 4 Anne, c. 9, 1704). About this time another species of negotiable instruments was devised and came into general use—the goldsmiths' or bankers' notes. These were the promissory notes of bankers, payable to bearer on demand, and originally given for money actually deposited with the maker by the one to whom they were issued. Lord Mansfield had no hesitation in treating them as negotiable by delivery. A little later the use of checks (q.v.) became general. For some time the legal status of this instrument was doubtful, but it has long been recognized as a species of bill of exchange, and is now authoritatively defined as a bill drawn on a bank and payable on demand.

The foregoing are the most common forms of negotiable paper, but several other forms have been found useful in mercantile transactions, and have received judicial approval, such as the bonds of business and municipal corporations, exchequer bills, and scrip for Government bonds. In order that a written contract may possess negotiability, it must be payable to order or to bearer and must be treated in the money market as a security for and representative of money. Accordingly, bills of lading (q.v.), warehouse receipts (q.v.), and like documents of title are not negotiable instruments, even in jurisdictions where they are declared by statute to be negotiable. They are not representatives of money and cannot perform the functions of currency. They are symbols of goods, and their transferee

gets no better title to the goods which they symbolize than he would secure by the actual delivery of the goods themselves. Hence the thief or the finder of a bill of lading cannot pass a perfect title to a bona fide purchaser thereof, as he can do in case of a bill of exchange or promissory note, which is payable to bearer or indorsed in blank.

The right to enforce negotiable paper free from defenses available against the transferrer or prior parties is confined to the bona fide holder, that is, to one who has become the owner of the paper before it is due, for value, and without notice of any defect in the transferrer's title. Such a holder, however, can pass his perfect title even after the paper is due, and to one who has notice of defects in the title of one back of such holder.

The law of negotiable instruments has been codified in Great Britain (Bills of Exchange Act, 1882, 45 and 46 Vict., c. 61) and in a number of our jurisdictions (Colorado, Connecticut, District of Columbia, Florida, Maryland, Massachusetts, North Carolina, North Dakota, Oregon, Pennsylvania, Rhode Island, Tennessee, Utah, Washington, Wisconsin). Consult: Chalmers, *Bills of Exchange Act* (London, 1902); Crawford, *The Negotiable Instruments Law, Annotated* (New York, 1902); Daniels, *Treatise on the Law of Negotiable Instruments* (New York, 1903); Bigelow, *The Laws of Bills, Notes, and Cheques* (Boston, 1900).

NEGOTIABLE PAPER. In its strict legal sense, this term is used interchangeably with the term 'negotiable instruments,' to denote any written securities for the payment of money, the legal and equitable title to which may be transferred by indorsement and delivery, or if payable to bearer, by delivery merely, and which if so transferred before maturity give the transferee complete title, and an absolute right to demand the amount named on the face thereof, free from any defenses which might have been available against the transferrer. However, the term is popularly employed to designate such instruments in writing, as promissory notes and bills of exchange, which alone had the above qualities by the 'law merchant,' or common law, and as distinguished from the term 'negotiable instruments,' which, in some jurisdictions, include municipal and corporate bonds, certificates of deposit, warehouse receipts, bills of lading, and other instruments. Therefore, the popular usage would exclude any instrument which was not negotiable by the common law, and which has only been given the peculiar qualities of negotiability by statute. Consult Story, *The Law of Bills of Exchange*; Parsons, *The Law of Promissory Notes and Bills of Exchange*. See NEGOTIABLE INSTRUMENTS.

NEGRI, nã-grê, ADA (1870—). An Italian poet, born at Lodi of a family of artisans. As a teacher in a village school, she wrote her first verses, which passed almost unnoticed in the columns of a periodical, but they attracted attention to her when published as the volume of lyrics entitled *Fatalità* (1893). A second volume, the *Tempeste*, appeared in 1896. Soon after the publication of the *Fatalità* she received a good post in the normal school at Milan. In Ada Negri's verse the note of protest against the abuses in the social order rings out loudly. She has noble ideals as to universal brotherhood, and depicts

in vivid colors the abject misery of those engaged in a constant struggle to gain the means of a livelihood. Spontaneousness and sincerity are undeniable qualities of her verse, but she may be said to idealize too much the figure of the peasant and artisan. Consult: Jean Dornis, *La poésie italienne contemporaine* (Paris, 1898); Mazzoni, in the *Nuova antologia* (Rome, June 17, 1893).

NEGRI, CRISTOFORO (1809-96). An Italian politician, historian, and geographer, born at Milan. He became professor at Padua in 1843, was the first member of the faculty to side with the Italian cause in 1848, and after Custoza and the success of Austria he was forced to resign his chair. He was almost immediately elected president of the University of Turin, and held a place in Gioberti's Ministry until the battle of Novara. He then became chief of the consular service and held this position under Azeglio, Rattazzi, and Cavour. Negri founded in 1867 the Italian Geographical Society, and was its president for five years. He wrote: *La grandezza italiana* (1864); *La storia politica dell' antichità paragonata alla moderna* (1867); and *I passati viaggi antartici e l'ideata spedizione italiana* (1880).

NEGRI, PAOLO (1853—). An Italian gynecologist. He was born in Verona, studied medicine at Padua, and, after teaching at Milan and at Novara, where he became director of the Obstetrical School, in 1886, was appointed director of the School of Obstetrics of the University of Padua, situated at Venice. He wrote: *Studi e ricerche di ostetricia* (1885); *Sulla idrocefalia ripetuta del feto* (1890); and *Cinquanta laparotomie* (1892).

NEGRITOS, nã-grê'tôz (Sp., little negro). The term applied by most modern ethnologists to one of the great ethnic groups into which the population of the East Indies is divided. Some anthropologists recognize a 'Negritic stock' consisting of three groups, Negrito, Papuan, and Melanesian, while others regard the 'Indo-Oceanic Negritos' as a separate branch of the *Homo Æthiopicus*, distinct from the 'Indo-Oceanic Negros' from whom they believe that the Papuans and Melanesians have sprung. It seems best, however, to count the Malays, Indonesians, Negritos, and Papuans as the four ethnic stocks of Malaysia. The term should be used in the restricted sense implied in the principal recent classifications of mankind in this area. The physical characteristics of the Negritos are: Small stature (great majority under five feet), a brachycephalic or subbrachycephalic head-form, a dark brown or black skin sometimes somewhat yellowish, the hair woolly (scanty on face and body), a flat nose, thickish lips, and other features of physiognomy and body of a negroid character. Many ethnologists assume that the earliest inhabitants of extreme Southeastern Asia, the Malay Archipelago, and neighboring regions were of this stock, but evidence for such a view is lacking. No real proof of their presence in Sumatra, Java, Borneo, Celebes, or Formosa has been produced. It is held by some, however, that the Negritos once inhabited Timor, Flores, and the islands near, while it has been reported that the Karons of the Arfak Hills in Northwestern New Guinea were Negritos, although this is not certain. The only

centres of undoubted Negrito population existing at present are in the Andaman Islands, the Malay Peninsula, and certain of the Philippine Islands, the pure Negritos being certainly represented only by the Mincopies, Sakai, and Aëtas. The Mincopies of the Andaman Islands, who average four feet ten inches in height, are taller than the other Negritos, except some of the Malaccans, who are probably crossed with Malays. The Semangs and Mantras, in the peninsula of Malacca, may be regarded as Negritos, while the Mintra and the Jakhuns of Johore are Sakai-Malay half-breeds, with lighter skin and taller stature. Some authorities, however, regard them as Negritos. The Semangs (whose own name is Mendi or Menik) of Northern Perak, Kedah, Rahman, Ranga, and Kelantan are described by Martin, who visited the Malay Peninsula in 1897, as representing a dark-brown ulotrichous variety of man, while the Sakai (whose own name is Senoi) of Southeastern Perak and Northwestern Pahang are a brown cymotrichous variety. Both are distinct alike from the Malayan and the Mongoloid peoples. The Blandas, Ma-meri (or Besesi) of Southern Selangor, the Mantra of the territory of Malacca and Rembau, and the Jakhuns of Johore he styles mixed peoples. As to head-form the Semangs are mesocephalic (tending to dolichocephalic), the purest Sakai are dolichocephalic, and the Besesi brachycephalic. The hair of the Semangs is frizzy or thick woolly, while that of the Sakai and of the mixed tribes is for the most part wavy. The Sakai may perhaps be the descendants of the Neolithic population of this portion of Farther India. The Aëtas of the Philippines, who number altogether some 10,000, are found in certain parts of the interior of Luzon, Mindoro, Panay, and Negros, and Northeastern Mindanao. The culture-status of the Negritos is very primitive, though the arts and industries of the Andaman Islanders, the best studied members of the stock, give more evidence of talent and ingenious adaptation to environment than is commonly attributed to them. The strict monogamy of the Sakai and their rather high morality ought also to be noted. The bow and arrow (often poisoned) is a characteristic Negrito weapon.

Consult: Quatrefages, *Les pygmées* (Paris, 1887); Man, *The Aborigines of the Andaman Islands* (London, 1885); Clifford, *In Court and Kampong* (London, 1897); Stevens, *Materialien zur Kenntniss der wilden Stämme auf der Halbinsel Malakka* (Berlin, 1892); Giglioli, *Nuove notizie sui popoli negroidi dell' Asia e specialmente sui Negriti* (Florence, 1879); Meyer, *Album von Philippinen-Typen* (Dresden, 1885); Blumentritt, *Ethnographie der Philippinen* (Gotha, 1892); Meyer, *Die Negritos* (Dresden, 1899).

NEGRO (Sp., Port., It. *negro*, black, from Lat. *niger*, black). The name properly applied to a subspecies of mankind of whom the chief characteristics are a dark skin, woolly or frizzly hair, and a dolichocephalic skull. The negroid type presents many modifications and has obtained a fairly wide dispersion, but is found in its purest state and in greatest numbers in Africa, and that continent must be considered its centre of distribution.

It is commonly held that the type is best represented by the Sudanese tribes of Africa, who are

regarded as true negroes. They are distinguished by a very dark brown or chocolate-colored skin, black crisp hair which is flat on section, a relatively long head, with flat, broad nose and projecting jaws with thick, everted lips. In stature they are tall, with long arms and slender legs.

The most important modification of this type is found in the Bantu group of tribes, which stretches southward in Africa from the Sudan to the Cape of Good Hope. This division is one based largely on linguistic grounds, and, presenting as it does many variations of slight extent, it is impossible to name any single physical character which distinguishes the Bantu negro from the Sudanese. In general, however, the Bantu face is less coarse than the Sudanese, the jaws less projecting, and the lips not so thick. In color of skin the Bantu shows all shades of dark brown, and in stature corresponds to the Sudanese.

A marked variation, and one difficult to account for, is seen in the dwarf races who are found in scattered groups across Central Africa surrounded by Bantu neighbors and extending far to the south, where they are represented by the well-known tribe of Bushmen. The Bushmen, with their somewhat taller neighbors, the Hottentots, are usually regarded as forming an independent stock not to be classed with the pygmies of the equatorial region. This problem is at present impossible to settle.

The dwarfs offer striking physical traits which differentiate them from the other negroid peoples of Africa. In stature the northern pygmies do not average much over four feet, the Bushmen seldom range over five feet, while the Hottentots are somewhat taller. In color the skin is a light yellowish brown, and, in the true dwarf groups, said to be covered with a sort of down. The hair is crisp and in the central dwarfs of a rusty brown color, while in the Bushmen-Hottentot group it is black and tufted.

Of the true negroes of the Sudan the most important tribes are, in the west, the Wolof, Mandingan, Felup, Timni, Kru, Sierra Leone, Liberian, Tshi, Ewe, Yoruba, Ibo, Efik, Borgu, and Mossi. In the Central Sudan, the Sonrhay, Hausa, Mosgu, Kanembu, Kanuri, Baghirmi, and Yedina; and in the east, the Maba, Fur, Nuba, Shilluk, Dinka, Bari, Abaka, Bongo, Mangbattu, Zandeh, Momfu, and Bari.

Of the Bantu tribes traced southward along the east coast and northward along the west, following their probable course of migration, the most important divisions are the Bonjo, Baya, Waganda, Wanyoro, Wapokomo, Wagiryama, Waswahili, Zulu, Mashona, Bechuana, Ova-Herrero, Eshi-Kongo, Bashilange, Balolo, Manyema, Bakalai, Fan, Mpongwe, Dwala, and Batanga.

The dwarf races of Central Africa are little known, but the most familiar are the Akka, Wochua, Obongo, and Batwa. In the south are the Bushmen and the Hottentots, the chief tribes of the latter being the Namaqua, Griqua, and Damara.

These peoples include the bulk of the African negroids. The dark-skinned natives of the north, viz. in Abyssinia and in neighboring regions, and along the Mediterranean, exhibit such differences and are so allied in other respects with Semitic and Hamitic peoples that they are usually classed with them.

The extra-African distribution of negroid stocks immediately presents difficulties. We can

disregard the negroes of the two Americas, who are almost invariably of West African descent and differ from their parent stocks only in the modifications due to mixture with Europeans and Indians.

The Australians, who are regarded as negroes by some authorities, must be considered an independent race presenting physical characteristics which differentiate them from the true negro, notwithstanding their dark skins.

There are, however, in the East Indian Archipelago, in New Guinea and Melanesia, and in Madagascar negroid tribes whose classification and relationships present difficulties at present insurmountable. Of these stocks the Papuans of New Guinea and the Melanesians are the most numerous and important. They are a dark-skinned, tall, dolichocephalic race, and differ physically from the African negro chiefly in the hair, which is longer and mop-like, and in facial features, which latter, however, are variable. There are no safe grounds for considering them as a branch of the true negro stock other than the striking resemblance in skin color.

At different points in the northern portion of this region are found scattered groups of an undersized negroid stock commonly called Negritos. They are usually compared with the dwarf races of Africa and undoubtedly do offer striking similarities in physical characters, but in other respects seem to correspond rather to the Australian and Papuan.

The parentage of the negroids of Madagascar is also in dispute. The proximity of Africa would indicate an origin from that continent, and there are both physical and cultural facts to support the view, but there are also unmistakable signs of Melanesian traits which suggest immigration from both regions.

Much has been written as to the mental capacity of the negro, but trustworthy information is scanty. Such few careful observations as have been made upon negro brains indicate a slightly lower type than that of Europeans; but the variability is so high as to forbid drawing any conclusions regarding the accompanying intellectual powers—a statement which holds true of the natives of Melanesia as well as of Africa.

In culture the negro presents almost as many degrees and varieties as there are stocks. A relatively low grade represented by certain of the Sudanese, Bantu, and dwarf tribes is found side by side with a relatively high civilization, as, for example, that of the Hausa; but it must be admitted that the sporadic examples of marked cultural progress in Africa can almost invariably be traced to Arabic or other foreign influence. Environment has, of course, produced specific types of culture in different parts of the continent, such as the cattle-breeding, pastoral life of the south and west, and the strictly hunting life of the dwarfs of the equatorial forests, and this diversity makes general statements dangerous or impossible.

With regard to religion, we find an extensive animism which has developed remarkably at different points. For example, the ancestor worship of the Zulus has been carried to a logical extreme, which is unique among savages, and the complex fetishism of West Africa is everywhere regarded as the type of that phase of belief.

Political organization is equally diverse, rang-

ing from hereditary kingship to such loose tribal systems that no chieftainship is ascertainable.

In comparison with other great groups of mankind, the negro seems to possess certain temperamental qualities which are more or less characteristic, being lively, excitable, and fond of social life and discussion; and this trait has undoubtedly played an important rôle in the development of certain phases of African culture. Our knowledge of the majority of the negro tribes of Africa is still lamentably slight, but, with the extension of European interests in that continent, much valuable information is coming to light. See NEGRO EDUCATION.

NEGRO, nã'grô, RIO. A tributary of the Amazon. See RIO NEGRO.

NEGRO BUG. A plant-bug of the family Corimelænidae. These bugs are usually of very small size and are intensely black in color, sometimes having a bluish or greenish tinge. They are convex in form, the scutellum covering nearly the whole upper side of the body, and are often mistaken for small beetles. They are fond of laying their eggs on small fruits, like blackberry and raspberry, giving them a very disagreeable taste. A common species in the United States, the flea-like negro bug (*Corimelena puticaria*), is frequently mistaken for the chinch bug.

NEGRO EDUCATION. Much of the negro advancement in the United States since the Civil War is to be credited to the regular habits of industry, and to the knowledge of the white man's religion, language, and ways of life gained in slavery days. To one connected with negro schools nothing is clearer than the value of the influence of good Southern white families upon their slaves. Some of the plantations were really large trade schools where habits of industry were formed. Carpenters, coopers, sawyers, blacksmiths, tanners, curriers, shoemakers, spinners, weavers, knitters, and distillers were all to be found among plantation slaves; and the negro mechanic was an important man in the community. Thus the race was being gradually trained in the ways of civilization, was contracting the habit of labor, acquiring a superior language and religion, and developing a character capable of further advancement.

Credit should also be given to the training which the colored man received during the Civil War. In the Northern armies there were thousands of colored troops who received discipline of the most valuable sort. In the South, the homes and farms of the white Confederate soldiers were largely in the hands of negro men and women. Most valuable to the slaves was the

gain in power and executive ability that came out of that experience. While their masters were fighting to keep them in slavery, they were receiving in the absence of those masters the education which was to fit them to be freemen.

The sudden emancipation of the blacks brought about a condition bordering upon chaos. The Southern white man knew little of the treatment due a negro freeman, and the negro knew as little what his relation to his former master should be. The white man was unable to look upon the black in any other light than as his servant, and the black man looked upon all service as degrading, considering that freedom and education ought to exempt him from labor, especially from the labor of the hands.

Upon the heels of the Northern armies came an army of devoted women, eager to teach the freedmen. In September, 1861, the American Missionary Association opened its first school for contrabands at Hampton, Va., the outcome of which is the Hampton Normal and Agricultural Institute (q.v.). In the following January schools were started at Hilton Head and Beaufort, S. C., and in 1862 and 1863 teachers were sent to Tennessee. The Rev. John Eaton, an army chaplain from Ohio, afterwards United States Commissioner of Education, was placed by General Grant in charge of the instruction of the colored people, of whom it is estimated that more than a million learned to read and write; of the 80,000 colored troops in the Northern army, 20,000 learned to read and write. The churches of the North vied with one another in their endeavors to bring education to the black man. In 1865 the Freedmen's Bureau (q.v.) was established, and, in addition to other work, it superintended the education given to the freedmen by the Government and the churches of the North. Between 1865 and 1870 more than five million dollars was expended by this organization for educational purposes. In some cases Government buildings and land were granted.

The proved capacity of the negroes for education suggested the wisdom and economy of providing their schools with teachers of their own race, and during the years from 1868 to 1878 there were founded twenty-five normal and collegiate institutions under the control of different religious denominations, the Congregationalists and Baptists leading in the number and size of their schools. They extended from Hampton in Virginia to Tillotson in Texas. At Atlanta, Nashville, Chattanooga, and other centres institutions were built costing from \$200,000 to \$500,000, and having a yearly attendance of from 300 to 500 students. They have trained many of the teachers of the negro race.

The work of these schools has often been criticised, and sometimes, perhaps, justly. But it is nevertheless true that they have had much to do with the uplifting of the negro race. From them have gone forth many of the best teachers of the negro public schools. Most of these institutions had as their model the New England high school or college. Latin and Greek had often a prominent place. The practical side of education, which was largely provided for in the New England home, was not supplied in the one-room cabin of the South. Too great emphasis was sometimes placed upon the literary and academic side of education, and too little upon the gaining of a knowledge of the common things

of life and of the forming of habits of intelligent industry. It was natural that the colored man, after years of forced labor, should revolt against any education that gave prominence to the work of the hand. It was natural that his teacher, who heard it continually said that negroes were fit only to be hewers of wood and drawers of water, should wish to prove that they could become successful lawyers, physicians, and clergymen. The wisdom of raising up leaders of a people is unquestioned, but where ninety per cent. of a race live on the land, as is the case with the blacks of the South, and where a large majority live, as the masses of the negro race still do, in one-room cabins under the lien system of crops, it would seem that there ought to be a close relation between education and vocation, and that their teachers and clergymen should be taught how to build their own houses, and how to cultivate their land properly. Each year is giving to these higher institutions for negroes in the South, as to the colleges of the North, curricula which have a more vital connection with life.

What is called race prejudice has caused a separation between the white and black races which, though attended with evil, has been productive of much good. The unwillingness of the Southern whites to allow white and black children to be taught in the same schools has resulted in the founding of the schools just described, which are in some respects superior to most of those that are open to the white children of the South. It has also resulted in a system of public schools taught by colored teachers which, while it has its disadvantages, has resulted in good to the race.

Before the year 1870 there were practically no negro public schools, with the exception of those in Memphis, New Orleans, and Nashville. There were, however, in the District of Columbia 10,494 colored children in public and private schools. In 1870, while for the most part there was opposition, certain far-seeing Southerners declared in favor of the education of the blacks. In 1871 a little improvement was made. In 1872 Delaware and Kentucky were the only States that had not made provision for negro education. In 1873 and 1874 State normal schools began to be established for the training of negro teachers. In 1877 the total number of negro children reported of school age was 1,513,065, and the number enrolled in the schools 571,506. There were twenty-seven normal schools with 3785 pupils, and twenty-three institutions for secondary instruction, with 2087 pupils. In 1882-83 the colored school population in the District of Columbia and the former slave States was 1,944,572, and the enrollment 802,982. Thus, less than twenty years after the war there was built up in the South a public school system for both whites and blacks, with normal schools for the training of teachers, which, considering the extreme poverty of the Southern States, was admirable. In 1897-98 the United States Commissioner of Education stated that there was an enrollment in the schools of 1,506,742 colored children, or 52.97 per cent. of the colored school population, while his report for 1900-01 shows an enrollment of 57.22 per cent. of the negro children. The average daily attendance in the colored schools is 62.46 per cent. of their enrollment.

No account of negro education in America

would be complete which did not include an account of the work of General S. C. Armstrong at Hampton Institute. Believing in the moral value of self-help, General Armstrong built up a school in which greater prominence was given to doing than to mere learning, where there was not only the schoolroom, but also the workshop; not only the church, but also the farm; not only the training of the mind, but also that of the heart and hand. An effort was made in this school to fit men and women for definite conditions, to develop a love for intelligent work, and to inspire in its pupils a strong desire to go out and help to uplift their people. The school at Tuskegee, founded by Booker T. Washington, Hampton's most distinguished graduate, was established with similar views. While receiving help from the North, both of these schools have put themselves in the closest touch with the South and its public school system. Their influence on this system has been marked. As a result of the kind of training given at Hampton and Tuskegee, hundreds of young people have been sent out who, by the establishment of homes, the cultivation of land, and the carrying on of business enterprises, have reconstructed whole communities. There is reason to believe that this type of school is meeting the pressing need, on the part of the negro people, of knowledge of the common duties of life, while, at the same time, it is providing a kind of training which results in the stability of character so lacking in the masses of this people.

In the establishment and conduct of negro schools, two wisely administered funds have had a large share. (See *PEABODY EDUCATIONAL FUND*; *SLATER FUND*.) Mention should also be made of the Southern and General Education Boards, which are composed of prominent Northern and Southern men. Both these agencies represent a union of wealth, business sagacity, and educational statesmanship that augurs well for the cause of universal education. The Southern Education Board conducts a campaign of education for the purpose of stimulating public sentiment in favor of more liberal provision for the common schools for both races. Its work is supplemented by that of the General Education Board, which, in addition to collecting information in regard to existing educational conditions among both races, is empowered to disburse certain funds where they are most needed for the strengthening of the agencies tending to promote the education of all the people.

NEGRO EXODUS. The name applied to a movement of freedmen from the Southern to the Western and Northern States in 1879 and 1880. The movement began in the early spring of 1879, and before the close of 1880 fully 40,000 negroes had removed to Kansas alone, while a large number had settled in Missouri and Indiana also. Many arrived at their destination poorly clad, generally destitute, and without promise of employment, and for a time there was much want and suffering among them. Large sums of money, however, were contributed for their relief throughout the North, especially in Kansas, where, soon after the arrival of the first band of immigrants, an efficient Freedmen's Relief Association was organized. The only Southern States from which the blacks emigrated in any considerable numbers seem to have been Mississippi, Louisiana, and Texas. The chief reasons given by the negroes for the abandonment of their homes were that they were forced to pay excessive rents, that the system of land tenure in the South was unjust, that exorbitant prices were charged by 'credit' merchants, and that the freedmen were wholly denied political recognition and were kept down in every way by 'bulldozing' methods. Opponents of the movement asserted that the negroes had been misled by the representations of land speculators, by misguided philanthropists, and by politicians who, in view of the approaching Presidential election, wished to import numbers of Republican voters into various parts of the North, where the Republican majority was doubtful. The movement seems to have been considerably furthered by the 'Nashville Colored Convention,' which met in Nashville, Tenn., May 7, 1879, adopted a report setting forth the grievances of the blacks and the many disadvantages, social, economic, and political, under which they labored in the South, and recommending that the negroes should emigrate to those States where their rights were not denied them. For an account of the causes of the movement, consult an article by Runnion, "The Negro Exodus," in the *Atlantic Monthly*, vol. xlv. (Boston, 1879); and for arguments justifying and condemning the movement, consult articles by R. T. Greener and Frederick Douglass, respectively, in the *Journal of Social Science*, vol. xi. (Boston, 1888).

NEGRO IN AMERICA. The first appearance of the negro in the English colonies in America was in 1619, when a cargo of negro slaves was landed at Jamestown. The scarcity of labor, especially in the Southern colonies, created an increasing demand for negro slaves; and by 1714 the number had increased to 58,850 (estimated). The greater part of these were brought direct from Africa, although considerable importations from the West Indies took place, and natural increase contributed an appreciable number. Importation was carried on more extensively in the following half century, the aggregate of negroes in the colonies reaching about 300,000 in 1754. In 1790 the first census found 757,208 in the United States. In the next hundred years this number was multiplied tenfold. This extraordinary growth in numbers has been due chiefly to natural increase; although

importations were considerable up to 1808, when they were prohibited by the Constitution. The smuggling in of Africans continued, however, up to the Civil War. Since that time there has been some immigration of negroes from the West Indies, not sufficient, however, to affect the truth of the proposition that recent growth in negro population practically represents a natural increase.

It is a matter of great importance whether or not the negro population is increasing more rapidly than the white. Table I. from the *Twelfth Census* shows the number of negroes in the United States for each decade, from 1790 to 1900, together with the percentage of the total population which the negroes represent:

TABLE I.

	Negroes	Percentage of total population of United States
1790.....	757,308	19.3
1800.....	1,002,037	18.9
1810.....	1,377,808	19.0
1820.....	1,771,656	18.4
1830.....	2,328,642	18.1
1840.....	2,873,648	16.8
1850.....	3,638,808	15.7
1860.....	4,441,830	14.1
1870.....	4,880,009	12.7
1880.....	6,580,793	13.1
1890.....	7,488,788	11.9
1900.....	8,840,789	11.6

It will be seen that the proportion of negroes to the general population has declined for every decade since 1810 except 1870-80; and it is now generally understood that the apparent increase for that decade was the result of faulty enumeration. It is true that much of the relative increase in white population is to be ascribed to immigration (q.v.). Nevertheless, it appears that the native white population is increasing faster than the negro population. Thus, for the decade 1890-1900, the native whites of native parentage increased 18.9 per cent., while the negroes increased 18.1 per cent.

DISTRIBUTION OF NEGRO POPULATION. In the colonial period negroes were found in every colony, but were most numerous in the South, where their services were in greater demand. The abolition of slavery in the North led to greater concentration in the South; and by 1860, out of 4,441,830 in the United States, only 226,216 lived in the Northern States. Since the war a considerable diffusion has taken place. At times it has been feared that a large proportion of the negroes would flock to the North; but adverse climatic conditions and the difficulty of competing with white labor have forced most of the negroes to remain in the South. See Table II. for the distribution of negroes.

TABLE II.
DISTRIBUTION OF NEGROES.

	1880	1890	1900
North Atlantic division.....	229,417	269,906	385,020
South Atlantic division.....	2,941,202	3,262,690	3,729,017
North Central division.....	385,621	431,112	495,751
South Central division.....	3,012,701	3,497,887	4,193,952
Western division.....	11,852	27,081	30,254

It will be seen that in absolute numbers the negroes have increased in each of the greater census divisions. Relatively to the general popu-

lation, their numbers have increased in the last decade in the North Atlantic division only. See Table III.

TABLE III.
PERCENTAGE OF NEGROES IN GENERAL POPULATION.

	1890	1900
North Atlantic division.....	1.6	1.8
South Atlantic division.....	36.8	35.7
North Central division.....	1.9	1.9
South Central division.....	31.3	29.8
Western division.....	0.9	0.7

Georgia had a negro population in 1900 of 1,034,813, Mississippi 907,630, Alabama 827,307, South Carolina 782,321. Virginia, North Carolina, Louisiana, and Texas exceeded 600,000. In Alabama the negroes are 45.1 per cent. of the total population; South Carolina, 58.4; Louisiana, 47.2; Georgia, 46.7; Florida, 43.7. A more detailed statistical study would show a tendency of the negroes to concentrate in limited areas in some of the Southern States. Thus, in five counties of the Yazoo-Mississippi delta, in Mississippi, the negroes form 87.6 per cent. of the total population.

ECONOMIC CONDITION OF THE NEGRO. As a laborer, the negro is capable of the hardest physical toil, and works without difficulty where the humidity and heat render labor intolerable for the white. He is lacking in stability, and is inclined to roam from one district to another without any satisfactory reason; he is wasteful and careless, requiring constant supervision. These characteristics have largely determined his economic position. As an agricultural laborer the negro is indispensable in the South, more especially in the low, swampy districts, where the white laborer readily succumbs to disease. As a domestic servant the negro has proved his usefulness. In manufactures, on the other hand, negro labor is unsatisfactory, since the negro will not remain in a position long enough to develop a high degree of skill. The same deficiency is driving him out of the handicrafts. Under slavery a large number of negroes were trained in handicrafts, and proved to be valuable workmen after emancipation; but the generation which has risen since slavery has manifested an unwillingness to enter upon the long period of training necessary for the exercise of the trades. The tendency toward agricultural labor and personal service is illustrated by the statistics of occupations of the *Eleventh Census*. In 1890, of all negroes in gainful occupations, 57.2 per cent. were engaged in agriculture, 31.4 per cent. in personal service, 5.6 per cent. in manufactures, 4.7 per cent. in trade and transportation, and 1.1 per cent. in the professions. In the Southern States the proportion engaged in agriculture was greater—64 and 71 per cent. for the South Atlantic and South Central divisions respectively.

The wages of the negro agricultural laborer in the South usually range from six to ten dollars a month, with substantial additions in the shape of food, house room, etc. In the busy season of the year the day laborer usually receives a far higher wage. A good cotton-picker in the Yazoo-Mississippi delta often earns a dollar and a half a day. Whether wages are high or low, the negro laborer is likely at any time to leave his employment, with resulting embarrassment to the employer. Hence, it is a common

practice to let small holdings to negroes, in order that interest in the crop may diminish their migratory tendencies. According to the census of 1890, 549,642 'farms' were occupied by negroes, of which only 22 per cent. were owned by their occupants. The tenant farmers sometimes pay a cash rental, but more frequently farm 'on shares.' The landowner furnishes machinery and draught animals, receiving one-half the crop. Frequently he advances food and other supplies to the tenant, recouping himself out of the tenant's share in the crop.

Whether as tenant or as independent landowner, the negro farmer has not as yet attained a high degree of prosperity. Negligence in the care of his stock and machinery and lack of foresight in the expenditure of his income prevent him from attaining economic independence. Recent educational movements (see NEGRO EDUCATION) aim to encourage the negro tenant to become a landowner, and to teach him how to utilize his land to the best advantage. The great mass of the negro farmers have not yet been affected by such influences.

In the North the negro manifests a tendency to concentrate in the cities, where his economic activities are chiefly confined to personal service and unskilled labor.

SOCIAL AND MORAL CONDITIONS. When account is taken of the fact that the ancestors of the American negro were taken from a state of barbarism in which moral standards were quite wanting, and were subjected only to comparatively weak moral restraint under slavery, it does not appear surprising that the social and moral condition of the negro is unsatisfactory. The great mass of the negro children receive an inadequate home training, and are therefore left to pursue their own inclinations, with the result that they readily lapse into their ancestral vices. The rules of monogamic marriage are but loosely obeyed—the exchanging of wives, for example, being not uncommon on Southern plantations. Illegitimacy is common. The percentage of illegitimate births among negroes in the city of Washington increased from 17.6 per cent. in 1879 to 26.5 per cent. in 1894. Sexual promiscuity is common wherever large negro colonies exist. Whether conditions are improving or deteriorating in this respect it is impossible to prove. It is, however, the testimony of a large number of observers that wherever the negro withdraws from the presence of the white population, moral conditions deteriorate; hence the tendency toward segregation noted above is generally viewed with anxiety by those who are most deeply interested in the improvement of the negro race. Wherever the economic conditions of the negro are improving, on the other hand, family life and morals also show a tendency toward improvement. The poverty of the masses of the negroes at present results in the overcrowding of cabins and tenements, which is destructive of family life and morality. For this reason students of the race problem look to the technical education of the negro as the best method of elevating him morally.

Statistics of crime present another serious problem connected with the presence of the negro in the United States. In 1890 there were in the Southern States six white prisoners to every ten thousand whites, and twenty-nine negro prisoners to every ten thousand negroes. In the Northern

States there were twelve white prisoners to every ten thousand whites, sixty-nine negro prisoners to every ten thousand negroes. In the South negro prisoners increased 29 per cent. per ten thousand between 1880 and 1890, while white prisoners increased 8 per cent. per ten thousand. While it is no doubt true that a larger percentage of crimes against property committed by negroes is detected and punished, and hence the relative amount of negro criminality may be exaggerated, it is also true that a large number of negro crimes committed against members of their own race are not punished at all, and so do not appear in the statistics of criminality. Crimes of violence appear to be increasingly frequent where the negroes are least in contact with the whites.

The greatest improvement in the position of the negro appears in the statistics of education. At the close of the Civil War it is doubtful whether more than 5 per cent. could read and write. In 1900 the percentage of illiteracy had been reduced to 44.5 per cent. But it does not appear that such education as the mass of the negroes have received has perceptibly affected their material or moral conditions.

POLITICAL CONDITION. After the close of the Civil War, the negroes, under the leadership of a certain class of whites, practically controlled the government of many of the Southern States. (See RECONSTRUCTION.) Their ignorance and lack of political training rendered them incapable of exercising political power wisely, and they were gradually excluded from power by the whites, at first by wholly illegal means, later by State laws and constitutional amendments. In 1890 the Constitution of Mississippi was amended so as to exclude from the suffrage any person unable to read any section of the Constitution, or understand it when read to him and give a reasonable interpretation of it. Payment of a poll tax was also required. The effect of this amendment was the exclusion of the greater part of the negro vote. In 1895 South Carolina amended its Constitution so as to exclude the votes of those unable to read or write any section of the Constitution, or to show that he owned and paid taxes on property assessed at \$300 or more. In 1898 Louisiana passed a similar amendment, with the addition of the so-called 'grandfather clause,' excusing from the limitations of the amendment all descendants of men who voted previous to the war, thus admitting to the suffrage illiterate, propertyless whites. North Carolina took similar action in 1900, though no property qualification was required. In 1901 constitutional amendments were adopted in Virginia and Alabama practically disfranchising the negro.

For the solution of the various 'negro problems,' social, economic, and political, several plans have been brought to public attention. Repatriation of the negro in Africa was widely advocated, especially in the first two decades after the Civil War; but the plan has been generally abandoned as impracticable, since the negro manifests no desire to return to Africa, and could not be forced to emigrate against his will. From a moral point of view, the plan has been condemned on the ground that it would mean a reversion to barbarism of the greater part of the race. Economically its effects would be grave, since the Southern States must for a long time rely upon the negro for unskilled labor.

The plan which finds greatest favor at present

is the industrial education of the negro, the encouragement of land-ownership by those who are now tenants, and the general extension of education. (See NEGRO EDUCATION.) The plan has already produced valuable results. Graduates of institutions like Tuskegee (q.v.) and Hampton Institute have proved that under the leadership of members of their own race negro communities are capable of rapid improvement, economically and morally. See NEGRO; NEGRO EDUCATION; SLAVERY.

NEGRO MELODIES. The music of the American negroes is essentially vocal. Their few musical instruments are of importance only for furnishing accompaniments to songs or for accenting the rhythm of the dance. During the last twenty years negro music has been steadily losing its distinctive features, owing to the tendency among the younger generation to discard everything which harks back to the days of slavery. The old plaintive melodies have been replaced largely by more modern comic and erotic songs which are cast in a nondescript African-European mode.

Negro songs may be divided into two general groups: those which show evidences of foreign origin, but which have been added to and changed until they are undeniably negro in character; and those which are the spontaneous expression of the negro's own feelings. The first group may be subdivided into (a) those derived from European songs and dances, and (b) those adapted from Baptist and Methodist hymns. The original negro songs, whose most typical element is a weird recitative, have undoubtedly an affinity with the musical forms used in Africa, but they have been greatly expanded both rhythmically and melodically. Though it is possible to make some such analysis of negro melodies, the most important feature, their interpretation, cannot be adequately described. Impromptu chords, notes, and accents are introduced, the whole blending into unusual forms with strikingly original melodies and motives. Strange to say, the time structure is excellent, and the tempo is universally exact. The tunes have as a rule a range of few notes, and, as in Africa, the major key predominates. In some songs both the major and minor keys are used. The weird effect produced by many of their cadences is not as a rule due to the use of the minor key so much as to the employment of the pentatonic scale, and the major scale with the flat seventh. A distinctive character of negro melodies is the 'rhythmical snap' which became such an overworked feature in 'ragtime.' See FOLK-MUSIC; RAGTIME. Consult: Ritter, *Music in America* (New ed., New York, 1900); Edwards, *Bahama Songs and Stories* (New York, 1895); Marsh, *The Story of the*

Jubilee Singers and Their Songs (Boston, 1880); and Trotter, *Music, and Some Highly Musical People* (ib., 1878).

NEGRO MONKEY. (1) A sooty black langur (*Simnopithecus maurus*), about 24 inches long, plus a still longer tail. The animal is well known in Sumatra and the Malay Peninsula. Its young are reddish in color and grow black with advancing age. (2) A marmoset (*Midas ursulus*) of Brazil, also called 'negro tamarin,' and often tamed. It is black with a reddish dorsal stripe.

NEGROS, nã'gròs. One of the Philippine Islands, belonging to the Visayas group. It lies between the islands of Panay and Cebú. It is separated from Panay and the small island of Guimarás on the northwest by the Strait of Guimarás, eight miles wide at the narrowest, and from Cebú on the east by the Strait of Tañón, from 6 to 22 miles wide (Map: Philippine Islands, G 10). On the north the island borders on the Visayan Sea, and on the southwest and south it is washed by the Sulu Sea, which to the southeast separates Negros by a distance of 30 miles from Mindanao. The island is roughly rectangular, but very elongated in shape. Its length is 134 miles, and its average breadth 26 miles, increased near the southern end to 34 miles by a broad, rounded peninsula, extending from the western coast. Its area is given as 4839 square miles. Including a number of small dependent islets, the area is 4854 square miles. It ranks fourth in size among the Philippine Islands.

The coasts are clear and steep, but very little indented, and afford no harbors except a few anchorages sheltered by the small adjacent islands. The whole interior consists of a mountainous plateau with a central ridge running the entire length of the island and dividing it into two distinct halves, forming its two political divisions. The active volcano of Canlaón or Malaspina, situated in the north central part of the island, is 8192 feet high. The range terminates at the north in the remarkable isolated peak Solitario. The two slopes are eroded into numerous lateral valleys watered by short and generally simple streams, the largest being on the western slope. In the southern part are two remarkable mountain lakes, the larger six miles long. The mountains of the interior are covered with vast forests of valuable timber, among which the teak is prominent. The soil is everywhere fertile and well watered, and agriculture is the principal occupation. The chief products are cacao of an excellent quality, hemp, sugar-cane, coffee, rice, tobacco, cotton, and cereals. The fisheries are next in importance to agriculture, and cattle-raising also receives considerable attention, large numbers of horses, carabaos, and hogs being raised.

The chief manufactures are abaca, cabo negro, sugar sacks, and sugar, the last-named manufacture employing hydraulic and steam machinery. Means of communication are very poor. Coasting vessels are almost the only means of communication between the towns. These are nearly all situated on the coast, the interior being a wilderness. The population of the island in 1901 was estimated at 372,000. The prevailing race is the Visayan, and the Visayan is the language most spoken. The forests of the

interior are inhabited by roaming savages. Politically the island is divided into the two provinces of Negros Occidental and Negros Oriental, whose areas, respectively, are 3112 and 1742 square miles, and whose populations are 231,000 and 141,000. The capital of the former is Bacolod, and of the latter Dumaguete. The two old provinces were continued under civil government by the Philippine Commission Act of February 6, 1901. Some resistance was offered to the authority of the United States by bands of natives, who kept American troops actively engaged on the island during the campaigns of 1899 and 1900. Consult *Apuntes de la Isla de Negros* (Manila, 1894).

NEGRUZZI, nă-grōo't'se, KONSTANTIN (1808-68). A Rumanian poet, born at Jassy, the disciple and translator of the poet Pushkin. He also translated some of Hugo's works, and wrote an epic poem, *Aprodul Purice*, and a volume of verse and prose, *The Sins of Youth*. His complete works were published in 1873. His son, JACOB (1843—), was born at Jassy, and became professor of commercial law at the university there, and afterwards at Bucharest (1885). In 1867 he founded and became the editor of the literary journal, *Convorbiri Literare*. His writings include: *Poesii* (1872); *Mirónasi Florica*, an idyl; *Mihiau Vereanu*, a novel; and the short stories in *Copii după natura*.

NEGUNDO (Neo-Lat., from the North American Indian name). A group of trees sometimes separated from Acer as a genus of the natural order Aceraceæ (see MAPLE), differing from the maples chiefly in the apetalous diœcious flowers, and in the pinnated ash-like leaves. The common negundo, ash-leaved maple, or box-elder (q.v.), is a native of North America often planted for ornament and extensively cultivated in the Western United States.

NEHANTIC. See NIAHTIC.

NEHEMIAH (Heb. *Nēhemyah*, Yahweh is consolation). A Hebrew leader of the fifth century B.C., whose memoirs are embodied in the Book of Nehemiah of the Old Testament. It is there stated that he was a son of Hachaliah, and cup-bearer to Artaxerxes (i.e. Artaxerxes I., Longimanus, B.C. 465-425) in the palace of Shushan. Having learned the sad condition of the returned colonists in Jerusalem, he prevailed upon the King to send him to his brethren there with full powers 'to seek their welfare.' He received an appointment as 'governor,' and worked for the safety of the city and its inhabitants. He rebuilt the city walls, notwithstanding many hindrances and dangers; he induced people from the country—priests and laymen—to take up their abode in the city, thus promoting its prosperity; above all he rekindled the flame of ancient piety and enthusiasm for the observance of the law in the hearts of the rough immigrants. He then returned to Persia, trusting to the new vitality which his reforms had, as he thought, infused into the Jewish commonwealth. But not long afterwards he had again to obtain leave from the King to return for the purpose of abolishing many abuses that had crept in during his brief absence. He enforced the rigorous observance of feast and Sabbath, and rearranged the temple service, procuring at the same time the means for its proper support by inducing the people to offer the tithes as of old.

Owing to the changes in the memoirs of Nehemiah which have been made in the course of the different editings to which they have been subjected (see NEHEMIAH, BOOK OF), it is difficult to separate the actual course of events from the traditional view concerning Nehemiah's activity. This much, however, seems certain: that Nehemiah paid two visits to Jerusalem, the one in B.C. 445, the other probably in 433. He came the first time on a special mission to protect Jerusalem from attack by rebuilding the walls, and for this work he was intrusted with full powers by the Persian King. He completed the restoration of the walls in the short space of fifty-two days, and provided for the proper guarding of the gates; afterwards he returned to the Persians. In this visit he appears as the 'governor.' In the second, however, he holds no such office; his purpose is to insure the enforcement of the provisions of the 'Priestly Code,' particularly those forbidding marriages between Jews and non-Jews. By his influence he succeeded in aiding the pious Ezra in his efforts. See EZRA.

NEHEMIAH, BOOK OF. One of the historical books of the Old Testament. In some Greek and Latin versions it is called the Second Book of Ezra, and in the Jewish canon the books of Ezra and Nehemiah originally constituted one book. It is the opinion of modern scholars that both books were put into their present form by one and the same editor. (See EZRA, BOOK OF.) The period covered by the Book of Nehemiah is the years B.C. 445-432. It is based upon the genuine memoirs of Nehemiah, but also, according to the critical view, contains much extraneous material, the memoirs having been freely used by compilers whose aim it was to prove that the work of restoration of the temple, the cult, and the general reorganization was performed by Babylonian Jews who returned from the Exile; whereas, as a matter of fact, much of the work was due to the section of the Jewish community of Jerusalem which had remained in the country. The contents of the book may be summarized as follows: Nehemiah's sorrow over the desolation of Jerusalem is depicted, and he prays to God for opportunity to rebuild the city (ch. i.). Permission is granted him by the King to undertake the work; he arrives at Jerusalem, surveys the ruins, and begins to rebuild the walls (chs. ii.-iii.). The opposition of enemies is related and the plans by which their schemes were defeated (ch. iv.). The people complain against the oppression of the nobles and the evil is redressed (ch. v.). Enemies form a plot to interrupt the work, which is frustrated by Nehemiah's boldness (ch. vi.). A record of the families that returned first from Babylon is given, followed by an account of the offerings made by rich and poor for the work (ch. vii.). The law is read by Ezra the Scribe, accompanied with a joyful celebration of the feast of tabernacles (ch. viii.). The people mourn, fast, and repent, a full confession of sin is made and a solemn covenant sealed by princes, priests, and Levites, and confirmed with an oath by the whole multitude to observe the law, sanctify the Sabbath, sustain the services of the temple, and bring in all the tithes (chs. ix.-x.). A tenth of the people are selected by lot to dwell in Jerusalem and the rest are distributed through the other cities of the land (ch. xi.). A list of

priests and Levites is given, and the joyous dedication of the wall, accompanied with sacrifices, is described (ch. xii.). During Nehemiah's absence in Persia heathen strangers were admitted into the temple; they are expelled after his return, and the broken covenant to pay the tithes, to sanctify the Sabbath, and to refrain from mixed marriages is enforced (ch. xiii.).

The chronological questions involved in the Book of Nehemiah will be found discussed in the articles EZRA, BOOK OF; and NEHEMIAH. As to how much of the book represents Nehemiah's memoirs, scholars are not agreed. The genuine historical basis of the work is probably the account of Nehemiah's first visit, his activity in the rebuilding of the walls, his return to Persia, and his subsequent second visit to Jerusalem to enforce the regulations of the 'Priestly Code,' which had been adopted by the people in B.C. 444 on the occasion of the first visit. For literature, consult the works mentioned under EZRA, BOOK OF.

NEHER, nă'ēr, BERNHARD VON (1806-86). A German historical painter, born at Biberach, Württemberg. He studied in Stuttgart under Hetsch and Dannecker, and in 1823 proceeded to Munich, where he studied at the Academy under Cornelius. During his sojourn in Rome, from 1828 to 1832, he produced "The Raising of the Youth at Nain" (1831, Stuttgart Gallery), and "Abraham Visited by the Angels" (1832, Basel Museum), and on his return to Munich was commissioned to execute the fresco painting "Entry of Emperor Louis the Bavarian" (1832-35), on the recently restored Isar gate. Appointed director of the Leipzig Academy in 1841, he thence went to Stuttgart in 1846, as professor at the School of Art, and became its director in 1854. His most important works there were a dozen great cartoons for stained-glass windows to be placed in churches in Stuttgart. Among several larger and smaller canvases, dating from that period, should be mentioned: "Descent from the Cross" (1855, Stuttgart Gallery), and "Spring" (1858, Royal Palace, Stuttgart).

NEHER, MICHAEL (1798-1876). A German architectural painter, brother of the preceding, born in Munich. On his way to Italy, in 1819, he spent some time at Trent painting portraits, but in Rome he took up genre subjects, and gradually gave more and more prominence to architectural surroundings. His "Roman Poultry Vender" (1825, New Pinakothek, Munich) is an exquisite specimen of that phase of his work. He returned to Munich in 1825, and painted many landscapes and architectural and costume pieces. After 1837 he confined his brush to those subjects with which his name was thenceforth associated, namely, views of city squares, enlivened with scenes from German life of the past. The New Pinakothek at Munich has "Interior of Chapel at Castle Trausnitz" (1838); "Views in Old Munich" (1842-43); "Magdeburg Cathedral" (1855); "Saint Vitus's Church in Prague."

NEHLIG, nă'lég', VICTOR (1830—). A French historical painter, born in Paris. He was a pupil of Cogniet and Abel de Pujol, and came to the United States in 1856. He opened a studio in New York, and in 1870 was made a member of the National Academy of Design. In 1872 he returned to Paris, where he still resides. Among his best works are: the "Bravo" (1870); "Ar-

morer of the Olden Time," "Gertrude of Wyoming," the "Artist's Dream," the "Cavalry Charge of Lieutenant Hidden," New York Historical Society; "Battle at Antietam," in possession of William Astor, New York; the "Captive Huguenot," "Pocahontas," "Hiawatha," the "Serenade," and "Waiting for My Enemy." Nehlig is successful in depicting historical scenes.

NEHRING, nă'ring, WLADISLAW (1830—). A German Slavic scholar, born at Kletzko, near Gnesen. He was educated at the University of Breslau, where he was appointed professor of Slavic languages and literature in 1868. Among his publications are: *Kurs literatury polskiej* (1866); *Study a literacki* (1884); and *Altpolnische Sprachdenkmäler* (1887).

NEIDE, nī'de, EMIL (1843—). A German painter, born at Königsberg. First a pupil of the Academy there, he continued his studies at Düsseldorf and Munich, especially under Dietz, and subsequently traveled in Belgium, Holland, France, and Italy. Previous to this journey he had executed the fresco painting "Ptolemy Observing the Constellations," in the Aula of the Gymnasium at Königsberg, where, after his return, he painted numerous portraits and several mythological subjects, of which "Psyche Conveyed Across the Styx by Charon" (1873, Königsberg Museum), "Orpheus and Eurydice" (1876, Halsey Collection, New York City), and the "Scenes from the Odyssey," in fresco for the Gymnasium at Insternburg, are the most prominent. In 1880 he was appointed instructor, and in 1884 professor at the Königsberg Academy. Two years afterwards he created a startling impression by his revolutionary change in the choice of subjects and their coloristic treatment, as exemplified by such sensational genre scenes as "On the Scene of the Deed" (the discovery of a murdered man's body), "Tired of Life," and similar incidents.

NEIDHART VON REUENTHAL, nī'hărt fōn roi'en-tăl (c.1180-c.1250). A German poet, born in Bavaria. He participated in the crusade against Damietta, Egypt (1218-19), and later resided at the Court of Frederick the Quarrelsome in Vienna. From Frederick he received a fief near Melk and other valuable gifts. He was the originator of a new form of the mediæval lyric—the peasant lyric written under the influence of the Court. In this he satirizes the wealthy but vulgar peasantry of Bavaria and Austria, with its display of finery, its brawls, and its insolence to betters. For this ridicule he was bitterly disliked by the rustic versifiers, and, by the name Neidhart Fuchs, was known as the enemy of the peasants as late as the sixteenth century. Neidhart's work was an important one in the development of the Volkslied, upon which it continued for two centuries to leave a distinct impression. A manuscript collection of his poems, dating from the thirteenth century, was edited by Benecke, in vol. ii. of the *Beiträge zur Kenntnis der altheutschen Sprache* (Göttingen, 1832). The critical edition by Haupt (Leipzig, 1858) is excellent. Neidhart is co-hero with the Pfaff Amis of Anastasius Grün's (Count Auersperg's) *Pfaff vom Kahlenberg* (Leipzig, 1850; 3d ed. 1877). Consult also, Bielschowsky, *Leben und Dichten Neidharts von Reuenthal* (Berlin, 1891).

NEILGHERRY (nêl-gé'ri) **HILLS**. Mountains in India. See **NILGIRI HILLS**.

NEILGHERRY (or **NILGIRI**) **NETTLE** (*Girardinia palmata*). A plant of the natural order Urticaceæ, nearly allied to the true nettles, and possessing the stinging power common in them. It is frequent on all the higher ranges of the Nilgiri hills. The natives obtain the fibre by first boiling the plant, to destroy its stinging properties, and then peeling the stalks. There are said to be two or three distinct forms or varieties of Neilgherry nettle fibre, and different specific names have been given the plants producing them. Its bark yields a long, soft, and silky fibre, which is said to be one of the best fibres produced in India.

NEILL, nêl, **EDWARD DUFFIELD** (1823-93). An American author and educator, born at Philadelphia. He attended the University of Pennsylvania for a time, but was graduated at Amherst in 1842, and afterwards studied theology at Andover. After ordination as a Presbyterian minister he removed to Saint Paul, Minn., in 1848, and became pastor of the first Protestant church. In 1851-53 he was superintendent of public instruction for the Territory, and from 1858 to 1861 chancellor of the State University. In 1861-64 he was an army and hospital chaplain. From that time until 1869 he was one of the secretaries of Presidents Lincoln and Johnson. President Grant appointed him consul to Dublin in 1869, but he returned the next year. In 1873-84 he was president of Manchester College in Saint Paul, and from that time until his death professor of history and literature. He published many historical works, chiefly concerning the colonial period. They are drawn entirely from original documents, and contain much valuable material, arranged, however, with little sense of proportion. The most important are: *History of Minnesota* (1858, 5th ed. 1883); *Minnesota Explorers and Pioneers* (1881); *Terra Mariæ*, a history of early Maryland (1867); *History of the Virginia Company of London* (1869); *English Colonization of America During the Seventeenth Century* (1871); *Virginia Vetusta* (1885); *Virginia Carolorum* (1886).

NEILLSVILLE. A city and the county-seat of Clark County, Wis., 66 miles northeast of La Crosse, at the junction of the O'Neil and Black rivers, and on the Chicago, Saint Paul, Minneapolis and Omaha Railroad (Map: Wisconsin, C 4). The city has a public library of 2000 volumes. It is the centre of a prosperous farming and cattle-raising community; there are manufactures of flour, furniture, and lumber in various products. Population, in 1890, 1936; in 1900, 2104.

NEILSON, nêl'son, **JAMES BEAUMONT** (1792-1865). A Scotch inventor, born at Shettleston, near Glasgow. He had little education in school, and at fourteen was set to work. He was employed by his brother, then as engineer of a colliery near Irvine, and in 1817 as foreman of the Glasgow gas works, where he made many improvements in the method of gas manufacture, and founded an institute for the education of employees. His great invention, that of the hot blast in manufacturing iron, was directly opposed to the belief of contemporary foundrymen that the colder the blast the better the quality and the greater the quantity; and his experi-

ments were long blocked by the impossibility of a fair test. Neilson's patent, taken out in 1828, was very successful. With equal fuel his method produced three times the iron of the cold blast. But the validity of the patent was attacked with some success, and many firms refused to pay the license for the blast. Neilson won the great suit against the Bairds of Gartsherrie in 1843, and four years afterwards retired to the Isle of Bute. His last years were spent at Queenshill, Kirkcudbright, where he established a working-man's institute.

NEILSON, **LILIAN ADELAIDE** (1848-80). The assumed name of an English actress named Elizabeth Ann Brown. She was born March 3, 1848, in Leeds, and her childhood at Guiseley was of the humblest. When fourteen years old she ran away from home, and going to London, was educated for the stage through the kindness of a chance acquaintance, making her début in 1865 in the part of Juliet. She played for a few years in various theatres of London and the provinces, till 1870-71, when she met great success as Amy Robsart in an adaptation of *Kenilworth*, and as Rebecca in *Ivanhoe*. At once she became one of the favorites of the English stage, and was equally popular in America, where she appeared nearly every year from 1872 to her death. Her great characters, besides those mentioned, were the Shakespearean Rosalind, Beatrice, and Imogen, and also Julia in *The Hunchback*. Early in her career she was married to Philip Lee, from whom she was divorced in 1877. She died suddenly in the prime of her beauty, in Paris, August 15, 1880. Consult: Scott, *The Drama of Yesterday and To-Day* (London, 1899); Marston, *Our Recent Actors* (ib., 1890).

NEILSON, **SAMUEL** (1761-1803). An Irish politician, founder of the United Irish Society. He was born at Ballyrone, County Down, the son of a Presbyterian clergyman, and established himself in Belfast as a woolen merchant, but his interest in politics soon forced him out of business. In 1792 he founded the *Northern Star*, an organ of the United Irishmen. The formation of this society had been suggested by Neilson in the previous year and was carried out by Wolf Tone. The *Star* was suppressed in 1797 after the editor, who aimed at complete separation from England, had several times suffered arrest and imprisonment. Rearrested in 1798, Neilson either bargained with the Government in behalf of all political prisoners that they were to be exiled to some country friendly to Great Britain, and in return would disclose the secrets of the United Irish Society, or in some other way managed to escape trial. In 1802 he was set free at Cuxhaven, soon afterwards came to the United States, and died at Poughkeepsie, N. Y.

NEIRA (nâ'é-râ) **BANDA**. One of the Banda Islands (q.v.).

NEISSE, nî'se. The capital of a circle, and a fortified town in the Province of Silesia, Prussia, on the Glatzer Neisse, 46 miles south-south-east of Breslau (Map: Prussia, G 3). The town proper on the left bank of the river is well built, and has a number of interesting features, of which the most prominent are the Gothic Church of Saint Jacob, dating from the twelfth century, the Jesuit Church, completed in 1688, the Rathaus with its high tower, the bishop's residence, now used as municipal offices, and the Catholic Gym-

nasium, formerly a Jesuit college. The town has manufactures of furniture, machinery, blankets, lace, and wire screens, and carries on a trade in sugar, wood, marble, and vegetables. Population, in 1890, 22,444; in 1900, 24,271. Neisse was formerly the capital of the Principality of Neisse, which belonged to the Bishopric of Breslau.

NEITH, nē'th. An Egyptian goddess worshipped especially at Sais in the Delta. She is mentioned in some of the most ancient inscriptions, but did not attain any special prominence until the time of Dynasty 26, which originated in Sais. Neith is represented as a woman wearing the crown of Lower Egypt, and holding in her hand a bow and arrows together with the sceptre of a goddess. It is probable that she was originally a Libyan divinity. Consult: Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897); Mallet, *Le culte de Neit à Sais* (Paris, 1889); Petrie, *Nagada and Ballas* (London, 1896).

NEIVA, nā'é-vā. A town of the Department of Tolima, Colombia, on the right bank of the River Magdalena, at the head of navigation for light craft, and 112 miles southwest of Bogotá (Map: Colombia, C 3). It is the chief centre for commerce for Southern Colombia, is celebrated for its cacao, and has an export trade in cattle. There are minor industries in silk-weaving and in the manufacture of hats. Its former trade in cinchona has largely disappeared through the destruction of the trees. Neiva was founded in 1550, and nineteen years later destroyed by the Indians. It was rebuilt in 1612 on its present site. It remained the capital of the department until 1888. Its population, in 1892, was about 5000; of the municipal district, 16,000.

NEJD, nēj'd. A region of Arabia. See **NEJED**.

NEKHBET, nēk'bēt. An Egyptian deity, the local divinity of the city of Eileithyia (q.v.).

NEKRASOFF, nyē-krā'sōf, **NIKOLAI ALEXEYEVITCH** (1821-78). A Russian poet, born in the Government of Podolia. At sixteen he left the Yaroslav Gymnasium, and was sent to Saint Petersburg to enter the Regiment of Nobles. He matriculated at the university in 1839, whereupon his father cast him off. For three years he suffered fearful privations, and amid his bitter surroundings his poetic genius turned into a 'muse of vengeance and dolor.' A tutorship in a preparatory school and some hack-work for periodicals improved his material circumstances. While writing for the *Annals of the Fatherland* he chanced to show Byelinski a poem, "On the Road." The warm praise of that great critic turned Nekrasoff to his true vocation. He bought the *Contemporary* (1847), which soon became the most popular monthly in Russia. The years between 1856 and 1866 were the most brilliant period in his literary activity. Until then despondent and doubting, he now shared the roseate hopes aroused by the great reform movement. Though mainly the singer of the people's sufferings, he did not confine himself within that narrow circle. His works depict the 'down-trodden and oppressed' of all classes of Russian society. His *Fatherland*, *Peasants' Children*, and *Last Songs* are among the most touching of his poems. The peasant groaning under the

heavy hands of the master, the workman hauling the barges on the Volga, the heroic devotion of the wives of the Decembrists as they follow their husbands to the Siberian dungeons straight from the glamor of the Court (*Russian Women*), bear witness to the range of his sympathies. The meeting of husbands and wives in the dark mines of Siberia (*Russian Women*) is probably the most moving and powerful episode in all Russian literature, and his *Hero for an Hour* would alone give him an international reputation. The long poem (5000 verses) *Who Lives Happily in Russia?* written in an unusual metre, is sometimes diffuse in the treatment of the whole life of the whole nation, but the greater part of it is admirable. He died January 8, 1878. The *Last Songs*, written with a dying hand, are overpowering in their intensity of feeling.

NÉLATON, nā'lā-tōn', **AUGUSTE** (1807-73). A French surgeon, born in Paris. He received his doctor's degree in 1836, from 1839 until 1851 was adjunct professor in the Faculty of Paris, and from the latter year until 1867 was professor of clinical surgery. He became a Senator in 1868, and a member of the Institute in 1869. He was one of the most skillful operators of his time, and made several important improvements in surgery, one of which, a probe, having an unpolished porcelain knob at its end, much used in military surgery in searching for bullets, is called Nélaton's probe. His principal work is *Éléments de pathologie chirurgicale* (2d ed. 1868-85).

NELEUS (Lat., from Gk. Νηλεΐς). A son of Poseidon and brother of Pelias. Having been exposed by their mother, the brothers were found and brought up by a herdsman, and when grown up were recognized by their mother, Tyro, who had married Cretheus of Iolcus. After Cretheus's death they quarrelled over the possession of Iolcus, and Neleus withdrew to Pylos in Messenia. Because Neleus refused to purify Heracles after the murder of Iphitus, Heracles killed all Neleus's sons except Nestor. According to one account Neleus perished with his sons. He is also said to have reestablished the Olympic Games and to have died at Corinth.

NELIGH, nē'līg. A city and the county-seat of Antelope County, Neb., 152 miles northwest of Omaha; on the Elkhorn River, and on the Fremont, Elkhorn and Missouri Valley Railroad (Map: Nebraska, G 1). Gates Academy (Congregational), with a library of 5000 volumes, is located here. The city is the commercial centre of a large agricultural and stock-raising region. Alfalfa is extensively cultivated in this vicinity. Population, in 1890, 1209; in 1900, 1135.

NELLORE, nēl-lōr', or **NELLUR**, nēl-lōōr'. The capital of a district, Madras, British India, situated on an elevation on the right bank of the Pennair River, eight miles from its mouth, and 96 miles northwest of Madras by rail (Map: India, D 6). It is irregularly built and has densely populated sections; but there are also some good streets. It is the seat of several European missions. One of the features of the vicinity is the anicut, 877 yards long, the chief irrigation work on the Pennair. The town has a good water supply. The ancient Sinhapur, "lion city," was formerly an important fortress. The discovery in the ruins of a Hindu temple, at the end of the eighteenth century, of a pot filled with second century Roman gold coins and medals,

chiefly of Trajan, Adrian, and Faustina, would point to a remote origin. Population, in 1891, 29,336; in 1901, 32,040.

NELSON. A municipal borough and manufacturing town in Lancashire, England, $3\frac{1}{2}$ miles northeast of Burnley (Map: England, D 3). Besides coal-mining, it has considerable manufactures of cotton, worsted, and silk. It contains a handsome market-hall, and a technical school. In 1850 it was a small village named after a roadside inn; its manufactures inaugurated its prosperity, and it was incorporated in 1890. It owns its water, gas, and electric lighting plants, market, free library, cemetery, and provides technical instruction. Population, in 1871, 5600; in 1891, 22,754; in 1901, 32,816.

NELSON. The capital of a province of the same name, in New Zealand, situated at the north end of South Island (Map: New Zealand, D 4). The harbor has a depth on bar of from 15 to 19 feet. The railway wharf can be reached only by vessels drawing 18 feet and under. Steamers periodically ply to Sydney and Melbourne. The manufactures of the town comprise cloth and leather goods. The centre of the town is a hill rising 40 feet above the surrounding streets, and laid out as a square with an Episcopal cathedral in its centre. The city was founded in 1841. Population, in 1901, 7000; of electoral district, 11,100.

NELSON. A town in the southeastern part of British Columbia, situated on the Kootenay River, 20 miles west of Kootenay Lake (Map: British Columbia, F 5). It is the chief mining centre of the Kootenay silver-mining region, and has a large smelting plant, saw mill, foundry, and machine shops. Population, in 1901, 5273.

NELSON, HORATIO, Viscount (1758-1805). The most famous of English admirals. He was born at Burnham-Thorpe, Norfolk, England, on September 29, 1758. His father was the rector of his native place, while his mother was a grand-niece of Sir Robert Walpole. Nelson received only a slender education, and at the age of twelve he entered the navy under the care of his maternal uncle, Captain Maurice Suckling. To this uncle he owed his early rapid promotion, and the advice which led to his careful training in seamanship. During his first period of service he made voyages to the Arctic regions and the East Indies, and suffered considerably from ill health, for throughout life Nelson was very weak physically, and often was maintained only by sheer force of will. In 1777 Nelson was made second lieutenant, and again went to the West Indies. In 1779 he became captain, and henceforth promotion came to him only in due order, since the regulations did not allow any promotion other than according to seniority after the rank of captain.

In 1783, after the war with France and the American colonies had closed, Nelson was for a short time put on half pay, but after a few months, part of which time was spent in France, he was appointed to the *Boreas*, on which he served in the West Indies until 1787. Here he performed his first notable service, which, however, brought him into conflict with his commander, Sir Richard Hughes, a well-meaning, but timid man. Contrary to the latter's orders and in opposition to powerful interests in the West Indies, Nelson insisted upon enforcing the Navi-

gation Acts against the United States and other foreign nations. He was ultimately upheld by the British Government, but for the time it involved him in vexatious law-suits and caused him much anxiety. While on this station Nelson first met at Nevis the widow of Dr. Josiah Nisbet, by birth a Miss Frances Woolward, whom he ultimately married on March 11, 1787, Prince William, afterwards William IV., giving the bride away.

Soon after his marriage Nelson started for home, and on November 30, 1787, he was relieved from active service. For some obscure reasons a coolness had sprung up between Nelson and the Admiralty, with the result that he remained in retirement until the threatened outbreak of the war with France in 1792 caused all officers to be recalled into active service. On January 30, 1793, Nelson received command of the sixty-four-gun ship *Agamemnon*, which, together with his last ship, the *Victory*, is most closely associated with his career. He served on it for over three years. He was assigned to the Mediterranean fleet, serving first under Admiral Hood, then under Hotham, and finally under Sir John Jervis (later the Earl of Saint Vincent). Several times he was sent on diplomatic missions, and on the occasion of one to Naples in September, 1793, Nelson for the first time met Sir William Hamilton and his wife Emma, the Lady Hamilton who was to have later so great an influence over him. Nelson took an active part in Hood's conquest of Corsica, commanding the marines at Bastia and Calvi, where he lost the sight of his right eye. This period of his life Nelson always considered the happiest part of his career, and it prepared him for the great events to come. In 1796 he was made a commodore, and received a new ship.

At this time Napoleon was winning his great victories over the Austrians in Italy. The position of the British fleet in the Mediterranean was becoming precarious, as Spain was about to join France, in which case the English fleet would be greatly outnumbered. The hold of the British on Corsica was loosening, since, under the influence of the great French victories, the Republicans were becoming very active on the island. Taking all these things into consideration, the British Government ordered Sir John Jervis to abandon Corsica, to withdraw from the Mediterranean, and return to England. These orders were received on September 25, 1796, and Nelson had to superintend the work, though he considered it best for Great Britain to retain everything, since he believed the British fleet sufficiently powerful to cope with the enemy.

In December, 1796, Jervis sent Nelson back to the Mediterranean to aid in the removal of the naval stores from the island of Elba, which the British had retained at the time they had abandoned the other posts in that sea. As he was returning he had to pass through the whole Spanish fleet, and on February 13, 1797, he had rejoined Jervis. The following day took place the great battle off Cape Saint Vincent (q.v.). Here by his rapid and independent manœuvres Nelson did much to carry the day, and Jervis was magnanimous enough to give him due credit. The Spanish fleet of twenty-seven ships was totally defeated by fifteen vessels, and one of the chief naval resources of France had disappeared. As a reward for his share in this great event Nelson received a knighthood of the Bath, and before this he had become in due order of promotion a

rear-admiral of the blue. His next duty was to bring the troops away from Elba, a task which he promptly accomplished. It is interesting to note that though at this time the serious mutinies in the fleet at Spithead and the Nore took place, Nelson had no difficulty with his men, who assured him of their loyalty. For a few weeks Nelson served off Cadiz, and then, at his own suggestion, he was detached to make an attack on the town of Santa Cruz, on the island of Teneriffe, believing that large Mexican treasure ships had taken refuge there, whose capture would deal a severe blow to Spain. The expedition arrived at its destination on July 20, 1797, and the following day an attack was made. This assault and some later ones were all repulsed. The plan had never anything to recommend it but its boldness and a belief that the place was not strongly defended. Nelson himself fought with great heroism and lost his right arm, and, as the wound did not heal well, he was compelled to return to England, where he arrived on September 3, 1797. On September 27 he was invested with the Order of the Bath by George III. in person, and at the same time a pension of £1000 a year was awarded him. At this time, on account of his ill health and a fear that he would never again be able to enter active service, his spirits were greatly depressed, but he revived at once when on March 29, 1798, his flag was again hoisted over a ship. On April 30th he rejoined the Earl of Saint Vincent off Cadiz.

From this time a new period in Nelson's life begins. He soon becomes the great man of his service, instead of merely one of many distinguished naval officers. It is the period which opens with Abukir Bay and closes with Trafalgar. It is necessary to consider now the state of Europe at the time when Nelson rejoined the fleet. Austria had been compelled by Napoleon's victories in Italy to sign the Preliminaries of Leoben on April 18, 1797, which were ratified soon after by the Treaty of Campo-Formio (q.v.). This left England with only one weak ally, Portugal, while it set Napoleon free to attack England itself. He thought the best place to injure England would be in the East, and for this purpose prepared his great Egyptian expedition. (See NAPOLEON I.) The news of Napoleon's intentions soon reached Saint Vincent, and in spite of the jealousy of some older officers, he detached Nelson to watch the French fleet and to check it. Nelson was unable to prevent it from getting to Egypt, and for months there was a weary hunt to find the French ships and compel them to fight. Finally, on August 1, 1798, Nelson discovered them in the Bay of Abukir, and in the battle that ensued the French fleet was completely defeated, and only two vessels escaped. Nelson received a wound on the head from which he suffered forever after. The brilliant victory at Abukir practically insured the failure of Napoleon's expedition, since it cut him off from his base of supplies. Nelson was created Baron Nelson of the Nile, and received a pension of £2000 a year, besides other numerous gifts and compliments both from England and abroad. On August 19th he sailed from Alexandria and on September 22d he finally arrived at Naples.

The Neapolitan period of Nelson's life, which covered the ensuing two years, was the one blemish on his otherwise glorious career. Here began his criminal relations with the wife of the Eng-

lish Minister at Naples, Sir William Hamilton, which led to a complete separation of Nelson and his wife early in 1801. Moreover, Lady Hamilton influenced Nelson's public acts, so that for a time he behaved rather as commander-in-chief of the Neapolitan navy than as an English admiral. He induced Naples, however, to make war upon France, but the Neapolitan army was soon decisively defeated, and the royal family was compelled in December, 1798, to leave Naples, where the French proclaimed the Parthenopean Republic. After residing for a while with the Hamiltons at Palermo, and vexed for a time on account of the appointment of a junior officer, Sir Sidney Smith, to an important command in the Levant, Nelson was finally roused again to action on May 12, 1799, by the news that Admiral Bruix with the French Brest fleet had escaped from that harbor and was about to enter the Mediterranean. The danger was imminent that the French would recover the naval supremacy in the Mediterranean, which had been destroyed by the victory at Abukir Bay. Nelson prepared for the emergency with his usual ability, when, to his disgust, Jervis resigned his command and was succeeded by Keith, an honest but by no means brilliant officer. Friction between him and Nelson existed from the start. On June 24, 1799, Nelson appeared before Naples intent upon securing that city before the French fleet should appear. He found that the Republicans had complete control and were aided by a Neapolitan squadron under Commodore Caraccioli. The Neapolitan admiral was captured on June 29th, and Nelson, as commander-in-chief of the Neapolitan navy, immediately ordered a court-martial, which sentenced the Commodore to death, and he was executed at once. Nelson has often been blamed unjustly for this action, the only fault which can possibly be imputed to him being that possibly he might have proceeded with more deliberation. The forts of the city had surrendered on June 26th. At this time Nelson was created Duke of Bronte by the despicable Ferdinand IV. of Naples. To the influence of Lady Hamilton, who was the intimate of the Queen of Naples, must be charged the serious disobedience of orders by Nelson shortly after. He had been ordered to join Lord Keith and to assist him to meet a large French fleet, but he preferred to remain at Naples. The danger, it is true, was averted; for on August 13, 1799, the French fleet reëntered Brest, but had Nelson come up in time it is just possible that another great victory might have been won. For a short time Nelson was commander in the Mediterranean, but he displayed no enthusiasm for his work. On January 20, 1800, he united his command with that of Keith, and after several quarrels Nelson was finally recalled by orders which reached him in June. He traveled overland with the Hamiltons, and, though he was received everywhere with great enthusiasm, his conduct gave great cause of scandal to all his friends. On November 6, 1800, the party arrived in England, and soon after Nelson's final breach with his wife took place.

On January 1, 1801, Nelson was promoted to be vice-admiral, and he was assigned to the command of Sir Hyde Parker, who was to coerce the Northern Confederation. This league, composed of the States on the Baltic, had been maintaining an armed neutrality, which in truth was only

a veiled attempt to aid Napoleon. Nelson advised an attack on the strongest member of the confederacy, Russia; but his daring plan was not followed, and instead the whole fleet sailed for Denmark. In a bold assault on the Danish fleet at Copenhagen, Nelson was victorious (April 2, 1801), and the Danes were compelled on April 9th to sign an armistice, which tied their hands, but left the English free. It was during the engagement of April 2d that Nelson, having received an order early in the day to cease action, placed his telescope to his blind eye and said, "I really do not see the signal." On May 5, 1801, Nelson was appointed commander-in-chief in place of Parker. He immediately proceeded to carry out his plan of attacking Russia, but found, when he arrived at Revel, that the Czar Paul had been murdered on March 24th, and his son and successor, Alexander I., was preparing to follow another policy. For his services in this campaign Nelson was created a viscount. He returned to England and lived with the Hamiltons. After some slight service in the Channel, the Peace of Amiens closed the war, and on October 22, 1801, Nelson left his ship.

Peace, however, proved of short duration, and on May 18, 1803, Nelson raised his flag on the *Victory* as commander-in-chief of the Mediterranean fleet. For two years he blockaded Toulon and kept a watchful eye on affairs, but Villeneuve escaped from Toulon with the French fleet on March 30, 1805. Napoleon was preparing at Boulogne to invade England, and for this purpose the different French fleets were to unite and cover the expedition. A most exciting chase followed, in which Nelson pursued Villeneuve to the West Indies and back to the coast of Spain, but the French admiral was unable to elude Nelson and the other English admirals long enough to give Napoleon any opportunity of crossing the Channel. Villeneuve finally put in at Cadiz and Napoleon marched against Austria, which had declared war against him. Thus England was saved.

Nelson now blockaded Villeneuve at Cadiz, but Napoleon was threatening to disgrace his admiral for not fighting, and consequently, when Nelson had to send six vessels to Gibraltar for water, Villeneuve seized the opportunity and started to leave his shelter on October 19, 1805, and on October 21st took place the famous battle off Cape Trafalgar (q.v.). Before beginning battle Nelson gave his now famous signal, "England expects that every man will do his duty." The victory was complete, but Nelson was mortally wounded, and died on the afternoon of October 21, 1805, with the words "Thank God, I have done my duty." By his final great victory he had destroyed the combined French and Spanish fleets, and Napoleon's hope of creating a naval power vanished forever. Nelson thus contributed immensely to the final destruction of the Napoleonic ambitions, for without the control of the sea England would have been unable to wage her long contest. Nelson was buried at Saint Paul's Cathedral, London, on January 9, 1806, amid extraordinary public demonstrations.

BIBLIOGRAPHY. Mahan, *Life of Nelson* (2d ed., Boston, 1899), is the latest and best account. The best recent brief accounts are: Laughton, *Nelson* (New York, 1895), and Russell, *Horatio Nelson* (2d ed., ib., 1899). The best and most complete of the old books is Clarke and McArthur,

Life of Nelson (2d ed., London, 1848), though the best known is the popular and untrustworthy Southey, *Life of Nelson* (ib., 1813). *Nelson's Dispatches and Letters*, edited by Nicolas (London, 1844-46), and *The Nelson and Hamilton Papers, 1756-1815*, published by Morrison (ib., 1893-94), are the most important primary authorities. Jeaffreson, *Lady Hamilton and Lord Nelson* (2d ed., New York, 1897) and *The Queen of Naples and Lord Nelson* (London, 1889), and Giglioli, *Naples in 1799* (New York, 1902), are the most recent books on the most perplexing problem in Nelson's life.

NELSON, SAMUEL (1792-1873). An American jurist, born at Hebron, Washington County, N. Y. He graduated at Middlebury College, Vermont, in 1813. He then read law, removed to New York State, where in 1817 he was admitted to the bar, and began practice at Cortland. In 1820 he was a Presidential elector on the Democratic ticket. His long judicial career of half a century began in 1823, when he was appointed by Governor Yates a judge of the State circuit court. In 1831 he was promoted to be an associate justice of the New York State Supreme Court, and in 1837, by appointment of Governor Marcy, he became Chief Justice of the court in succession to Judge Savage. In 1845 he was nominated by President Tyler as an associate justice of the Supreme Court of the United States. Although he concurred with Chief Justice Taney in the "Dred Scott" decision in 1857, and disapproved of the President's exercise of "war powers" during the Civil War, his loyalty was never questioned, and he was frequently consulted by Lincoln in judicial matters. He ranks as one of the greatest American authorities on admiralty and maritime law, and his prize-court decisions during the Civil War are of the utmost importance. In 1871 he was appointed by President Grant as one of the Joint High Commission for the settlement of the Alabama claims (q.v.).

NELSON, THOMAS (1738-89). An American patriot, one of the signers of the Declaration of Independence. He was born at Yorktown, Va., and was the son of William Nelson, Governor of Virginia in 1770-71. He went to England in 1753, was educated at Eton and at Trinity College, Cambridge, and returned to his home at Yorktown in 1761. He was a delegate for several terms to the House of Burgesses, and served in the Provincial Conventions of 1774, 1775, and 1776, introducing in the last the resolution by which Virginia's delegates to Congress were instructed (May 15th) to propose a declaration of independence. From August, 1775, until May, 1777, when he was forced by ill health to resign, he was a delegate to the Continental Congress, and signed the Declaration of Independence. In 1775 he was for a time colonel of the Second Virginia Regiment, and from August, 1777, until late in 1782, he commanded the Virginia State forces, rendering valuable service at the siege of Yorktown (1781), where he showed his patriotism by ordering the gunners to fire upon his own mansion, supposed to be the headquarters of Cornwallis. In 1779 he again sat for a time in Congress, and was again forced by ill health to resign; in 1780 he raised a large sum of money, on his own security, for the State, and paid out of his own pocket the arrearages of two Virginia regiments ordered South; and in the spring of

1781 he succeeded Jefferson as Governor of Virginia, though he resigned in November. Impoverished by his liberal advances to the State during the war, he passed his last years in very straitened circumstances, and much of his property was sold to pay public debts, for which he was security.

NELSON, WILLIAM (1825-62). An American naval officer and soldier, born in Maysville, Ky. He entered the United States Navy in 1840, and in 1847 commanded a battery at the siege of Vera Cruz. He subsequently served in the Mediterranean and South Pacific, was promoted to the rank of master in 1854 and to that of lieutenant in 1855, and in 1858, as commander of the *Niagara*, transported to Africa the negroes who had been rescued from the slave-ship *Echo*. In 1861 he was on ordnance duty at Washington, and at the outbreak of the Civil War he was placed in command of the gunboats on the Ohio, with the rank of lieutenant-commander. He left the navy soon afterwards, entered the military service, was ordered to Kentucky, and there established recruiting stations, and organized camp 'Dick Robinson,' near Danville, and a similar rendezvous at Washington, in Mason County. In September, 1861, he became a brigadier-general of volunteers, and at the battle of Shiloh (April 6-7, 1862) he commanded the second division under General Buell. (See **SHILOH, BATTLE OF**.) He was wounded in the engagement at Richmond, Ky.; was in command at Louisville, Ky., in 1862, when the Confederate general Bragg threatened that city, and in July of this year was commissioned major-general of volunteers. On September 29th he was fatally shot at the Galt House, Louisville, by the Federal general Jefferson C. Davis, in a personal quarrel.

NELSON, WOLFRED (1792-1863). A Canadian physician and revolutionist. The son of an English officer, he was born at Montreal. In 1811 he began the practice of medicine in Saint Denis. In the war with the United States, 1812, he served as surgeon. He was chosen representative of Sorel in the Canadian Parliament of 1827. He took a leading part in the revolution of 1837, and was in command at the victory obtained by the insurgents at Saint Denis, on the Richelieu River, but was captured and sent to Bermuda as an exile. The following year he settled at Plattsburg, N. Y., and in 1842, after the declaration of a general amnesty, returned to Montreal. He was again elected to Parliament from his former district in 1844 and 1845, and in 1851 was made inspector of prisons, a position which he held for several years. He served as Mayor of Montreal two terms and was at the head of the Lower Canada College of Physicians and Surgeons. He died in Montreal.

NELSON MONUMENT. A granite column in the centre of Trafalgar Square, London, copied from a Corinthian column of the Temple of Mars Ultor, in Rome, and crowned with a statue of Nelson, 17 feet in height. The shaft, 145 feet high, was erected in 1843 by voluntary subscriptions. The pedestal bears bronze reliefs, cast from French cannon, depicting scenes from Nelson's life. At the foot of the column are four colossal bronze lions, by Sir Edwin Landseer.

NELSON RIVER. The principal river in the Canadian Territory of Keewatin, forming the lower course of the Saskatchewan (q.v.) (Map:

Northwest Territories, K 3). It flows from the north end of Lake Winnipeg, first northward, through a series of lakes, then northeastward, into Hudson Bay at York Factory, after a course emptying through the estuary of Port Nelson of about 400 miles. It is deep, wide, and swift, discharging an enormous volume of water; rapids and falls in its upper reaches limit its navigation by steamers to from 80 to 90 miles, though boats can ascend 127 miles from its mouth.

NELSON'S FARM, BATTLE OF. See **FRAZIER'S FARM, BATTLE OF**.

NELSONVILLE. A city in Athens County, Ohio, 62 miles southeast of the State capital, Columbus; on the Hocking River, and on the Hocking Valley Railroad (Map: Ohio, F 7). There is an important trade in coal, which is mined extensively in the vicinity, this being one of the most productive coal fields of the State. Nelsonville has a large establishment which manufactures mining implements, car wheels, etc., and conducts a large repair business. The water-works are owned by the municipality. Population, in 1890, 4558; in 1900, 5421.

NELUMBO (Ceylonese name), *Nelumbium*. A genus of aquatic plants similar to water-lilies, and often included under that name in the natural order Nymphæaceæ. The few species which are found in the warm parts of Asia, North America, and the north of Africa, are all distinguished by the beauty of their flowers. *Nelumbium speciosum*, with rose-colored flowers, is the Egyptian bean of Pythagoras, the lotus (q.v.) held sacred by the Hindus and by the people of Tibet, has been used as a food by the Egyptians from remote antiquity, and is much esteemed where it is cultivated, especially in China, for its edible seeds, roots, leaf-stalks, and flower-stalks. The seeds resemble acorns in size and shape, and have a more delicate flavor than almonds. The root contains much starch, and Chinese arrowroot is said to be obtained from it. Great quantities are pickled with salt and vinegar, and eaten with rice. When powdered it makes excellent soup with water or milk. The ancient Egyptian mode of sowing this plant, by inclosing each seed in a ball of clay, and throwing it into the water, is practiced at the present day in India. *Nelumbium luteum* is a North American species, with yellow flowers, which extends almost as far north as Ontario. The edible seeds, called water chinquapins, are sought for by children and others, and the farinaceous roots are agreeable when boiled.

NEMATHELMINTHES (Neo-Lat. nom. pl., from Gk. *nēma*, thread + *ēlms*, helmins, worm). A large and important phylum of the unsegmented worms, of a more or less elongated cylindrical form and known as 'round-worms.' Their skin is thick and strong, and is usually wrinkled, giving the body a slightly annulated appearance, which, however, disappears if the animal is placed in water. The nervous system in the higher forms consists of two lateral ganglia at the anterior extremity, which are united by a nervous ring, and from which two nervous trunks, one dorsal and one ventral, proceed to the posterior part of the body. In the lower forms the dorsal cord is wanting, or else the ventral cord is wanting and there are two lateral cords. Special organs of sense are rarely met with; but a general sense

of touch exists, and a few of the free-living species have two simple eye-spots. The digestive organs are extremely simple. No blood system nor distinct respiratory or excretory organs can be detected. These worms are unisexual; but the males are comparatively rarely found, and are always smaller than the females. With the exception of the two families—the Enoplidae, which are mostly marine forms, and the Anguillulidae, or paste and vinegar eels—all the animals of this class are parasitic.

This phylum is divisible into three very distinct classes, namely, *Acanthocephala*, which have a protrusible proboscis armed with continuous hooks, and are destitute of an intestinal canal; the *Gordiacea*, which possess an intestinal canal, but no anus; and the *Nematoda*, which usually possess a perfect intestinal canal, provided with two orifices. See ASCARIS; ENTOZOA; FILARIA; GUINEA-WORM; PINWORM; ROUNDWORM; THREAD-WORMS; TRICHINA.

NEMATOCYST (from Gk. *νήμα*, *nēma*, thread + *κύστις*, *kystis*, bladder). One of the lasso-cells, thread-cells, or netting organs (*cnidae*) of jellyfishes and other Cœlenterata, acting as organs of offense and defense. These bodies are imbedded in the outer cellular layer or ectoderm of cœlenterates. A nematocyst is an oval, tough capsule, filled with a clear fluid, and invaginated at one end in the form of a hollow process which is prolonged into a long coiled hollow thread. The entire structure is developed in an interstitial cell called a cnidoblast, which, as it approaches maturity, migrates toward the surface and becomes imbedded in one of the large ectoderm cells. At one point on its surface the cnidoblast is produced into a delicate protoplasmic process, the cnidocil or 'trigger-hair.' Any small animal on coming in contact with the lasso-cells of a jellyfish is stung, benumbed, or poisoned by them. Upon contact with one or many of these lasso-cells in the tentacles of a jellyfish or hydra, or a physalia, the cnidoblast suddenly contracts, and the pressure upon the stinging capsule causes an instantaneous eversion of the thread, at the base of which are minute sharp barbs. The threads also convey a poisonous fluid, which benumbs the victim. In this way sea-anemones and coral polyps obtain their food, paralyzing and thus capturing quite large animals, even young fishes. These poison lasso-cells also occur in certain Protozoa, mollusks, and in sponges, and in a modified form exist in the skin of certain worms, both terrestrial and aquatic. They are in these worms minute stiff rods, either coiled up in an irregularly spiral manner, or short and straight, contained in oval cells. They are shot out in great numbers when the animal is irritated, but are not retractile, being projected clear from the skin. That they are true netting organs is proved by the fact that on touching the worms with the tongue they cause a tingling sensation. See illustration under CœLENTERATA.

NEMATODA. A class of the phylum Nematelminthes (q.v.), mostly parasites, but many others are extremely abundant in both fresh and salt water. They are the roundworms (q.v.) and a familiar example is found in *Ascaris* (q.v.). They are ranked in two orders: *Nematoidea*, in which the cœlom is not lined by epithelium, and

Gordioidea, in which it is so lined. See HAIR-WORM; NEMATHELMINTHES.

NEM'ATOG'NATHI (Neo-Lat. nom. pl., from Gk. *νήμα*, *nēma*, thread + *γνάθος*, *gnathos*, jaw). An order of fishes. See CATFISH; compare PLECTOSPONDYLI.

NEMATOPHYTON (Neo-Lat., from Gk. *νήμα*, *nēma*, thread + *φύτον*, *phyton*, plant). A gigantic fossil alga found in rocks of Devonian age in the Eastern United States and Canada. The stem is of great size, often 40 feet long by 2 to 3 feet in diameter, and resembles the trunk of a tree to such extent that it was originally supposed to be the trunk of a conifer. This resemblance led Dawson to name it Prototaxites or ancestral yewtree. The cellular structure is that of an alga. Several large trunks were uncovered near Monroe, Orange County, N. Y., during 1897 to 1899. The type species is *Nematophyton Loganii*.

NEMAUSUS. An ancient town of Gallia Narbonensis, now Nîmes (q.v.).

NĚMCOVÁ, nĚm'tsô-vâ, BOZENA (1820-62). A Czech novelist, born in Vienna. She lived in Bohemia for several years, making a study of the life in its villages. One of her novels on this subject, *Babička* ("Little Grandmother," 1855), is especially well known. It has frequently been translated into foreign languages, and into English by Gregor in 1891. Her other works include *Karla* ("Charlotte," 1856) and *Pohorská vesnice* ("The Village in the Mountains," 1856). Her contributions to the study of Bohemian and Hungarian folk-lore in the volumes *Národní báchorky a pověsti* (1845-46) and *Slovenské pohádky a pověsti* ("Slovak Folk Tales," 1858) are valuable. Her complete works, *Sebrané spisy*, were published in 1862-63.

NĚMEA (Lat., from Gk. *Νεμέα*). The ancient name of a well-wooded valley of Argolis, in the Peloponnesus, between Cleonæ and Phlius. It lies north and south, and is from two to three miles long, and more than half a mile broad. In it there was no town but a sacred inclosure and temple of Zeus, of which three columns are still standing, while the others lie where they have been thrown by earthquakes. The valley was the seat of one of the four great national festivals of the Greeks—the *Nemean Games*, which were celebrated in mid-summer every two years, at the beginning of the second and fourth year of each Olympiad. The first of the historical period seems to have been held in B.C. 573, though legend ascribed the foundation of the games to the seven heroes on their march against Thebes, or to Hercules. The games consisted of the usual athletic contests, horse-racing, and a competition for players on the cithara. The prize was a palm branch and crown of parsley.

NEM'ERTINEA (Neo-Lat., from Gk. *Νημερτης*, *nēmertēs*, name of a Nereid, from *νημερτής*, *nēmertēs*, unerring, from *νη-*, *nē-*, not + *ἀμαρτάνειν*, *hamartanein*, to miss). A class of flatworms easily distinguished from the Platyodes by the proboscis and the presence of an anus. They are also remarkable for the prodigious length attained by some of the species, which, in the most extended state, is 10 or 12 feet, and one (*Linus longissimus*) reaches 90 feet. But the animal which so stretches itself out is capable of suddenly contracting itself to a

quarter of that length. The nemertineans are unsegmented worms, with a ciliated body epithelium, and are more or less dorso-ventrally flattened. There is no distinct body-cavity; the intestine is straight, with lateral diverticula; the anus is at the posterior end of the body. The blood, nervous, and excretory systems are all present, and are usually very well developed. The only sense-organs are little ciliated pits possibly olfactory, and pigment eyes. The sexes are separate and the larva goes through a complicated metamorphosis in most cases. One of the characteristic features of the nemertineans is the proboscis, lying above the oesophagus and opening from its cavity, just over the mouth. This proboscis may be used in the capture of food, which consists, to a large extent, of other sorts of worms. These worms twine themselves into knots and rolls, apparently inextricable, but without any real entanglement. A large number of species are known from all parts of the world. The great majority are marine, but a few are fresh-water, and land forms are known. The latter are all small and dull-colored, but the marine forms, besides being oftentimes very large, are frequently very gaudy, red and green being common colors. These worms usually pass through a metamorphosis; the pre-larva is called a 'pili-

PILIDIUM OF NEMERTES.

The worm is shown growing within the larva; v, velum; e, eyes; i, intestine of the nemertinean worm.

dium,' which is helmet-shaped with side lobes or lappets. A reduced form of the pilidium is called Desor's larva. The body of the pilidium is not entirely absorbed by the growing worm, but the worm develops within the larva, and finally frees itself, when the remnant of the pilidium dies. Certain forms have a direct development. Multiplication by transverse fission is frequent. Consult Shedson, *Cambridge Natural History*, vol. ii. (London, 1896).

NEMESIA'NUS, MARCUS AURELIUS OLYMPIUS. A Carthaginian Latinist of the latter half of the third Christian century. He wrote *Cyngetica*, 'On Hunting,' of which the 325 lines preserved constitute what is apparently an introduction to the main work (edited by Baehrens in his *Poetæ Latini Minores*, 1879, and by Stern, together with Grattius, 1832); and four *Eclogæ*, reminiscent of Vergil, of Manilius, and most of all of Calpurnius Siculus, with whose poems they are so constantly found in manuscript that they long passed as his work (edited by Baehrens, as above, and by Schenkl, 1885; translated into

English verse by Scott, 1891). The fondness of the author for the refrain and other points of similarity in style have suggested the attribution to Nemesianus of the *Pervigilium Veneris*; but this is entirely problematical.

NEMESIS (Lat., from Gk. Νέμεσις, from νέμειν, *nemein*, to distribute). A goddess of fate, who apportions to men their deserts. In Homer Nemesis does not appear as a person, though the word is used as a common noun in the sense of 'righteous anger.' In another early epic, the *Cypria*, Nemesis was a goddess beloved by Zeus, whom she sought to escape by transforming herself into various animals. Finally, the god approached her as a swan, and she brought forth an egg, which was found and kept by Leda, till in fullness of time Helen, the cause of the Trojan War, was born. Nemesis was worshiped at Smyrna, in Ionia, where there seem to have been two goddesses of the same name, and especially at Rhamnus in Attica, where were two temples, an old one, and a large new one erected in the period following the Persian wars. It contained a famous statue of the goddess by Agoracritos, the pupil of Phidias, of which the head is in the British Museum. According to Hesiod, Nemesis was the daughter of destructive night. She is the avenger of wrong, punishing especially vaunting pride, and in general any overstepping of the bounds of due moderation. Those who forget to humble themselves before the gods or who offend against the eternal laws are likely to fall under her power. In Alexandrian poetry Nemesis is frequently invoked to punish a cold or fickle loved one. In art Nemesis appears as a dignified youthful figure, bearing frequently a measuring-rod or an apple-branch in one hand, and commonly drawing forward the upper seam of her tunic. In later art she is frequently winged, with a wheel at her feet, or a griffin at her side, or holding a bridle.

NEMESIUS (Lat., from Gk. Νεμῆσιος, *Nemesios*). A Greek philosopher, of about the middle of the fourth century A.D. He was Bishop of Emesa, and wrote in Greek a treatise on *The Nature of Man*, in which he expressed his belief in the preëminence of the soul, the freedom of the will, and the indestructibility of matter. There is a passage in the book which has been interpreted as showing some understanding of the circulation of the blood. In Latin translation the work was much read during the Middle Ages, and since then it has been translated into several of the languages of modern Europe. There is an edition by Matthæi (Halle, 1802).

NEMI, nā'mē. A lake in Italy about 17 miles southeast of Rome, having on its margin a famous grove of Diana. It was anciently called *Lacus Nemorensis* and also *Speculum Diana*, mirror of Diana. The grove of Diana was celebrated on account of its priest, who won his place by slaying his predecessor, and held it only till he was himself slain. The grove seems to have been situated on the northeast shore, near the modern village of Nemi. The lake fills the crater of an extinct volcano, is about 1100 feet above the sea, four miles in circumference, and has no outlet except a passage of unknown antiquity which still serves its original purpose. It had long been known that there were remains of vessels sunk near the shore, but it was not till 1895 that these were satisfactorily

examined. One seems to have been about 200 feet in length, and 80 feet beam; the other was perhaps 250 feet long. The decks were paved with thin slabs of porphyry and serpentine, and the railings were of gilded bronze. Lead water-pipes with the name of Caligula furnished a clew to the date, and seemed to imply fountains on board. Though commonly called ships, it is far more probable that they were great rafts used in some spectacle connected with the worship of Diana. On the ritual of the grove, consult Frazer, *The Golden Bough* (2d. ed., London and New York, 1900).

NEMOURS, ne-mōōr', DUKE OF. A French general who gained fame in the Italian wars of Louis XII. See *Gaston de Foix*, Duke of Nemours, under FOIX.

NEMOURS, LOUIS CHARLES PHILIPPE RA-PHAEL D'ORLÉANS, Duke de (1814-96). Second son of Louis Philippe. He was born in Paris and educated at the College of Henry IV. In 1831 he was elected King of the Belgians, but declined the offer. He served in the two Belgian campaigns, and in Algeria, and was in 1837 made lieutenant-general. After the death of his elder brother, the Duke of Orléans (July 13, 1842), it was proposed to confer the regency upon the Duke de Nemours; but this was not sanctioned by public opinion, and he left France on the outbreak of the Revolution in 1848, and did not return till 1871. After the adoption of the anti-royalist bill of 1886 his name was struck off the army list.

NENA SAHIB, nā'nā sū'hēb. Leader in the Sepoy Mutiny in India. See NANA SAHIB.

NENCIONI, nān-chō'nē, ENRICO (1840-96). An Italian poet and critic, born at Florence. He was one of that literary company called the 'Amici pedanti,' of which Carducci was the leader. He wrote for the *Italia Nuova*, and translated much French and English poetry into his language. Especially remarkable are his papers on English literature. Toward the end of his life he held a professorship at the Woman's Normal School in Florence. His works include: *Versi* (1880); *Medaglioni* (1883 and 1897); and *Studi di letteratura straniera* (1897-98).

NENNIUS. An historian who lived in Wales at the end of the eighth and beginning of the ninth century, and who is believed by some to be the author of the *Historia Britonum*. Little is definitely known about him. The *Historia Britonum* contains a description of Britain, and deals briefly with the period of the Roman occupation, and the subsequent events, as the incursions of the Picts and Scots and the Saxon conquest. As an historical source it has little value, but it is of some importance for the study of early British mythology, especially for the study of the legend of Arthur, and because it contains the genealogies of English kings to 796. The best edition is by Mommsen, in *Monumenta Germaniæ Historica: Auctores Antiquissimi*, vol. xiii. (Berlin, 1898). For secondary works, consult: Zimmer, *Nennius Vindictatus* (Berlin, 1893); Thurneysen, "Nennius Vindictatus," in *Zeitschrift für deutsche Philologie*, vol. xxviii. (Halle, 1895); id., in *Zeitschrift für celtische Philologie*, vol. i. (Halle, 1897); Gross, *Sources and Literature of English History* (New York, 1900).

NEOCENE (from Gk. *neos*, *neos*, new + *kaibos*, *kainos*, recent). A geologic term em-

ployed by the United States Geological Survey to designate the middle portion of American Cenozoic time, and corresponding to the combined Miocene and Pliocene periods of the Lyellian classification.

NEO-DARWINISM. Although Darwin, in his *Animals and Plants Under Domestication*, gave more weight to changes in the conditions of life, conceding that natural selection was not an exclusive factor in organic evolution, Wallace and others, notably Weismann, have insisted on the 'all-sufficiency' of natural selection, pushing, as many think, Darwinism far beyond its legitimate bounds. See WEISMANNISM.

NE'OGÆ'A (Neo-Lat., from Gk. *neos*, *neos*, new + *gaia*, *gaia*, earth). An alternative name in zoögeography for the continent of South America, or Neotropical Region, in conformity with 'Aretogæa,' 'Notogæa,' and so on.

NEO-HEGELIANISM, nē'ō-hā-gā'll-an-iz'm. A term often applied by opponents to the doctrine of those English, Scotch, and American thinkers who, more or less under the influence of Hegel, hold that consciousness and object are mutually implicated, and who, believing in the historical priority of the physical universe to the finite consciousnesses which are in some way correlated with physiological organisms, feel themselves forced to the conclusion that there is an eternal consciousness, of which the universe is the object. T. H. Green, J. and E. Caird, J. Watson, H. Jones, D. G. Ritchie, and Josiah Royce may be mentioned as prominent among those to whom the epithet is often applied. See especially GREEN, THOMAS HILL.

NEO-KANTIANISM, nē'ō-kān'ti-an-iz'm. A term applied to the doctrine of those followers of Kant who accept the general result of Kant's philosophy so far as the theory of knowledge goes, but do not follow Kant in his endeavor by practical reason to work out a metaphysics. F. A. Lange, H. Cohen, P. Natorp, J. Volkelt, and O. Liebmann may be mentioned as representatives of this tendency.

NEO-LAMARCKISM. The modified doctrine held by those naturalists who accept in the main the teachings of Lamarck (q.v.). Lamarck was the first truly scientific thinker to state in a detailed way the causes not only of the origin of species, but of certain types of animal life, such as some orders of birds, of the groups represented by the ai, lemur, the kangaroo, and so on. The chief Lamarckian factors of organic evolution (see LAMARCKISM) are changes in the environment, direct in plants and the lowest animals, indirect in the higher animals; also, the use and disuse of organs, and the transmission of characters acquired during the lifetime of the individual, or what is called 'use-inheritance.' The first writer after Lamarck, on the lines laid out by the great French zoölogist, was Herbert Spencer. In 1866-71, in his *Principles of Biology*, Haeckel claimed (1868) that we should have to adopt Lamarck's theory of descent for the explanation of biological phenomena, "even if we did not possess Darwin's theory of selection," adding: "The one is so completely and directly proved by the other, and established by mechanical causes, that there remains nothing to be desired."

In America, Cope (1866-71) and Hyatt (1866-74) independently advocated Lamarckian views.

Cope first (1871) furnished what he considered as "an actual demonstration of the reality of the Lamarckian factor of use, or motion, as friction, impact, and strain, as an efficient cause of evolution." A. S. Packard (1871), by his studies of the embryology of *Limulus*, and of cave animals, was led to adopt Lamarckian views in preference to the theory of natural selection, which never seemed to him adequate or sufficiently comprehensive to explain the origin of variations and the rise of new types; and it was he who originated the term *Neo-lamarckism*. "Neo-lamarckism," he explained, "gathers up and makes use of the factors both of the Saint-Hilaire and Lamarckian schools, as containing the more fundamental causes of variation, and adds those of geographical isolation or segregation (Wagner and Gulick), the effects of gravity, the effects of currents of air and of water, of fixed or sedentary as opposed to active modes of life, the results of strains and impacts (Ryder, Cope, and Osborn), the principle of change of function as inducing the formation of new structures (Dohrn), the effects of parasitism, commensalism, and of symbiosis—in short, the biological environment; together with geological extinction, natural and sexual selection, and hybridity."

Among American zoölogists who have advocated Lamarckian views are W. H. Dall, J. A. Allen, R. T. Jackson, C. H. Eigenmann, and others; in England, Spencer, Henslow, Cunningham, Gadow, and others; in France, Giard, Perrier; and in Germany and Holland, Haeckel, Wagner, Eimer, Standfuss, Fischer, Plate, Pfeffer, O. Hertwig, Emery, Roux, and others.

NEOLITHIC MAN (from Gk. *neos*, *neos*, new + *lithos*, *lithos*, stone). The term applied by European archaeologists to the races in a supposed geological period when the polishing of stone, agriculture, pottery, weaving, domestication of animals, and the construction of pile dwellings on lakesides in Switzerland, France, Italy, and Ireland, the burying of the dead in dolmens, and the rearing of megalithic monuments, were practiced.

NE'ON (Gk. *νέος*, *neu*, sg. of *νέος*, *neos*, new). A gaseous element obtained from the atmosphere by William Ramsay and Morris W. Travers in 1898. It resembles helium, and, like other members of its group, has among its characteristic features a disinclination to unite with other elements. Neon is separated from the atmosphere in the same way as krypton. Its atomic weight is given by Ramsay and Travers as 19.94.

NE'OPHYTE (Fr. *néophyte*, from Lat. *neophytus*, from Gk. *νεόφυτος*, from *νέος*, *neos*, new + *φυτός*, *phytos*, grown, from *φύειν*, *phyein*, to grow). The name given in early ecclesiastical language to persons recently converted to Christianity. The word is used in this sense by Saint Paul, and is explained by Saint Gregory the Great as an allusion to 'their being newly planted in the faith.' It differed from catechumen (q.v.), inasmuch as it supposed the person to have not only embraced the doctrines of the Church, but also to have received baptism. Saint Paul, in the passage referred to, directs Timothy not to promote a neophyte to the episcopate; and this prohibition was generally maintained, although occasionally disregarded in extraordinary circumstances, such as those of Saint Ambrose

(q.v.). The duration of this exclusion was left for a time to the discretion of bishops; but several of the ancient synods legislated regarding it. In the modern Roman Catholic Church the same discipline is observed, and extends to persons converted not alone from heathenism, but from any sect of Christians separated from the communion of Rome. The time, however, is left to be determined by circumstances.

NEO-PLATONISM. The name applied to the teachings, primarily of the Græco-Alexandrian school of philosophy, and later of a number of Italian humanists, as well as some Englishmen. The extension of the Roman Empire and the growing intercourse between different parts of the world gave rise to an eclectic tendency which combined features of various systems. The process of amalgamation showed itself most prominently at Alexandria, whose central position made it a meeting-place for the chief religions and philosophies of the ancient world. Such a philosophy, therefore, as that promulgated by the Neo-Platonists, combining the peculiar mental characteristics of the East and the West, naturally originated there, though it soon ceased to have any local connection. The term Neo-Platonism is sometimes loosely used to signify the whole new intellectual movement proceeding from Alexandria, and attempts have been made to include among its exponents some of the Christian Fathers, such as Clement of Alexandria and Origen; but the name is more properly applied to the school of Ammonius Saccas (q.v.) and his followers. Plotinus (q.v.), a pupil of Ammonius, was its most important champion. Porphyrius, Iamblichus, and Proclus (qq.v.) represent a continuous decline in philosophic interest, and a greater and greater tendency to wild and fantastic religious syncretism. In common with Neo-Pythagoreanism and the Judæo-Alexandrian philosophy represented by Philo, the teaching of this school is characterized by a dualistic opposition of the divine and the earthly, an abstract conception of God which excludes all knowledge of the divine essence, a contempt for the world of sense which rests on the Platonic doctrines of matter and of the descent of souls into bodies, the supposition of mediating forms which carry over the divine operations into the world of phenomena, the demand for an ascetic liberation from a life of sense, and a faith in a higher revelation obtained in ecstasy. Notwithstanding the assumption that these doctrines were deductions from the teachings of Plato, the school brought the whole of philosophical science under a new systematic form. In their view, the basis of the divine nature is unity, the One; from this as the primordial source of all things emanates 'pure intelligence'; and from this, in turn, emanates the 'soul of the world,' whose creative activity produces other lesser souls, of men and animals. The doctrine of the divine immanence in this *anima mundi* was one of the most marked points in later Neo-Platonism, and led very close to pantheism. One of the last Neo-Platonists of antiquity was Boëthius (q.v.), who by his continued popularity became the most influential medium for the transmission, during the early Middle Ages, of Greek philosophy to Western Europe.

The fifteenth century witnessed a strong revival of interest in these speculations. Nicholas of Cusa (q.v.) and other mystics seek to over-

come the doubt arising from the inadequacy of human conceptions by the theory of man's immediate knowledge or intuition of God—a theory distinctly akin to the Neo-Platonic doctrine that the soul in a state of ecstasy has the power to transcend all finite limitations. The Italian humanists, in their reaction against the previously dominant Aristotelianism, paid great devotion to anything that seemed to derive from Plato. Marsilio Ficino, especially, by his translations of Plotinus, Porphyrius, and Iamblichus, contributed to the spread of these doctrines. The Cambridge Platonists (q.v.) were not without their affinities to the Alexandrian teaching; and Wordsworth's prevalent idea of the existence of a soul in nature which holds converse with the soul of man might be traced to the same source. Consult: Whittaker, *The Neo-Platonists* (Cambridge, 1901); Bigg, *The Christian Platonists of Alexandria* (Oxford, 1886); id., *Neo-Platonism* (ib., 1895); Hipler, *Neuplatonische Studien* (Vienna, 1868); Jules Simon, *L'école d'Alexandrie* (Paris, 1843-45); Kellner, *Hellenismus und Christenthum* (Cologne, 1865); and see NEO-PYTHAGOREANISM.

NEOPTOLEMUS (Lat., from Gk. *Νεοπτόλεμος*, *Neoptolemos*). The son of Achilles and Deidamia, also called Pyrrhus. After the death of his father he was taken by Odysseus to Troy, where he was distinguished by his courage, and was one of the band who entered Troy inclosed in the wooden horse. He was the slayer of the aged Priam. He returned with rich spoils to Phthia and married Hermione, the daughter of Menelaus. According to later legend he brought back with him as part of his booty Andromache, the wife of Hector, and settled in Epirus, and later married Hermione when he had gone to Phthia to restore Peleus to his throne. He was killed at the altar at Delphi by Orestes, the former lover of Hermione, or by the Delphians. He was buried within the precincts of the temple, where he was afterwards worshiped as a hero.

NEO-PYTHAGOREANISM. The name of one of the two Græco-Alexandrian schools of philosophy, the other school being the Neo-Platonic. (See NEO-PLATONISM.) Pythagoreanism was revived in the first century B.C., by P. Nigidius Figulus, a Roman prætor, but Apollonius of Tyana (q.v.) was the most prominent representative of this attempt to blend Pythagorean philosophy with Oriental theosophy. The Neo-Pythagoreans regarded it as the greatest task of the philosopher to purify himself from connection with matter by the suppression of desire and by the observance of certain ceremonial rules which were adopted from the earlier Pythagorean brotherhood. In their theoretical system, numbers had symbolic significance. Consult: Zeller, *Die Philosophie der Griechen*, part iii.; *Die nacharistotelische Philosophie* (3d ed., Leipzig, 1880-81); Vacherot, *Histoire critique de l'école d'Alexandrie* (Paris, 1846-51); also the histories of philosophy by Ueberweg-Heinze, Windelband, Erdmann, and Bergmann.

NEORNITHES, *né-ôr-nî-thêz* (Neo-Lat. nom. pl., from Gk. *neos*, *neos*, new + *ornis*, *ornis*, bird). Modern birds, as distinguished from those of Jurassic times, which are called *Archornithes*. They are characterized by fused metacarpals, the second finger longest, and the caudal vertebrae not more than thirteen in number. The group com-

prises not only existing groups, but all fossil birds except *Archæopteryx*.

NEOSHO, *nê-ô'shò*. A city and the county-seat of Newton County, Mo., 21 miles southeast of Joplin, on the Saint Louis and San Francisco and the Kansas City, Pittsburg and Gulf railroads (Map: Missouri, B 5). It has a public school, library, and the Scarritt Collegiate Institute (Methodist Episcopal South), opened in 1888. The United States Government fish hatchery here includes thirteen ponds, well stocked with various species of fish. The city is on the edge of the zinc and lead mining district of southwestern Missouri, and manufactures foundry and machine-shop products, agricultural implements, flour, etc. Settled in 1839, Neosho was incorporated as a town in 1868, and in 1878 was chartered as a city. Population, in 1890, 2198; in 1900, 2725.

NEOSHO. A river rising in Morris County, east central Kansas (Map: Kansas, G 3). It flows southeast through eastern Kansas, then southwest and south through Indian Territory, joining the Arkansas River near Fort Gibson, after a course of about 350 miles. The chief towns on its banks are Oswego, Burlington, and Emporia. Its principal tributary is the Cottonwood.

NEOTROPICAL REGION. In zoögeography, a primary division embracing South America and its islands, Central America, and the hot lowlands of Mexico and the West Indies. Other names proposed for it have been Austro-Columbian, *Dendrogæa*, and *Notogæa*. Its characteristics are more distinctly marked than in some of the other regions, and indicate a remote antiquity for the mainland areas, and also a long period of isolation from North America. It also has some curious resemblances to the Australian Region, especially in the presence of marsupials and ratite birds. It is naturally divided into four subregions by physiographic features. The first, or Brazilian Subregion, comprises the great forested equatorial area from the Caribbean coast to the pampas of Southern Brazil. The second, or Chilean Subregion, stretches along the Andean plateaus and the dry coast strip between the Andes and the Pacific, from Peru to about latitude 4° N. The third, or Mexican Subregion (q.v.), consists of Central America and tropical Mexico. The fourth, or Antillean Subregion, embraces all the West Indies except Trinidad and Tobago, which are continental in their characteristics. The region as a whole is characterized by great richness of life, as well as by marks of isolation. Wallace found that it had eight families of mammals absolutely confined to it, including the distinct group (Cebidæ and Hapalidæ) of 'New World' monkeys; the blood-sucking bats (*Phyllostomidæ*); the chinchillas, caviæ, and three other families of rodents. Nearly all the edentates of the world are collected here—sloths, armadillos, ant-eaters, and the like. It has also many important lesser groups, as the llamas, the opossums (save one species), the hutias, the solenodons, and many peculiar carnivores. The absence of certain groups is notable; it has no civets, no insectivores (save a shrew or two from the North), no wild cattle or sheep, no ruminants, except the llamas and a few deer, and no other hoofed mammals except the tapir (elsewhere

known only in Malaya) and the peccary. In birds the case is even more extraordinary. About twenty-five of its families are not known elsewhere, including such large or peculiar groups as the plant-cutters, manakins, cotinga, ant-thrushes, tree-creepers (*Dendrocolaptidae*), toucans, todies, mot-mots, curassows, tinamous, sun-bitterns, and many others; while it possesses the great majority of several groups, such as the humming-birds, only scantily present in North America, and not known at all in the Old World. A similar account might be given of regional peculiarities in the departments of reptiles, amphibians, fishes, and the many branches of invertebrate life. The West Indies, as a part of this region, present some extraordinary peculiarities. Though so near to the shores of North America, their zoölogical affinities are distinctly Neotropical, and they present curious resemblances to the island fauna of Madagascar. See AMERICA, paragraph *Fauna*; Zoögeographical Map under DISTRIBUTION OF ANIMALS; and consult the authorities there cited.

NE'OZO'IC (from Gk. *neos*, *neos*, new + *ζωή*, *zōē*, life). A term introduced by Edward Forbes to include all the strata from the Trias to the most recent deposits. It has been occasionally used as a substitute for Cenozoic (q.v.), and for the Tertiary system (q.v.).

NEPAL, né-pál', or **NIPAL**. An independent State on the southern slope of the Himalayas, bordering on Northern India (Map: India, D 3). It is bounded by Tibet on the north, by the native State of Sikkim and Bengal on the east, and by Bengal and the United Provinces of Agra and Oudh on the south and west. Its area is estimated at 54,000 square miles.

The southern portion, known as the *terai*, is a level strip of land, partly covered with forests and well cultivated. The rest of the country belongs to the region of the Himalayas (q.v.), and contains some of the highest mountains in the world, such as Mount Everest (29,000 feet) and Dhawalagiri, which are covered with perpetual snow. There are a number of minor ranges intersecting each other and inclosing numerous valleys. The country belongs to the basin of the Ganges, its chief rivers being the Karnali and the Sarju in the west, the Gandak in the centre, and the Kusi in the east. The climate varies considerably in accordance with the configuration of the surface. In the mountainous part it is naturally cold, while in the flat region along the southern boundary and in some of the valleys of the interior it is hot and humid. The average temperature at Khatmandu (over 4300 feet) is about 62°. Deposits of iron, lignite, copper, lead, and zinc are found and exploited to some extent by the natives. There are also many mineral springs and some deposits of gold and silver. The chief occupation of the inhabitants is agriculture; although carried on in a primitive way, it is highly intensive, owing to the scarcity of agricultural land. The slopes of the hills and ledges even, difficult of access, are utilized for agricultural purposes, and the methods employed for diverting mountain torrents for irrigational needs exhibit noticeable and varying degrees of ingenuity.

The chief crops in the central valleys are several varieties of rice, wheat, pulse, corn, sugar-cane, potatoes, and various vegetables. In the

terai region are cultivated tea, cotton, tobacco, etc. Many European fruits are successfully cultivated. The chief manufactures are coarse cloth, paper, brass bells, utensils, and ornaments. Excellent pottery is produced in some parts of the country and the wonderful wood-carving found in the temples testifies to the skill of the natives. The commerce of Nepal is chiefly with British India and Tibet. From British India are imported cotton goods, silver, spices, salt, brass, copper, sugar, iron, leather goods, etc. These are partly re-exported to Tibet, which sends in return drugs, tea, woolen cloth, salt, paper plant, domestic animals, honey, wax, silver, gold, etc. The chief exports to British India are rice, oil seeds, cattle, tobacco, hides, timber, and glue. The exports to and imports from British India amounted in 1900-01 to \$5,987,049 and \$5,257,372 respectively. Goods are usually transported by human carriers or pack animals.

Theoretically Nepal is an absolute monarchy, but the actual rulers of the State are the Prime Minister and his party. There are a State Council and a number of courts. The savage native code has been humanized by British influence. The revenue of the Government is derived chiefly from land tax, customs, mines, forests, and monopolies. There is an efficient army of about 50,000, which can be greatly enlarged in case of necessity in view of the fact that the Gurkhas (q.v.) are all efficient fighters.

No reliable figures as to the population of Nepal are available. Native statistics place it at 5,000,000, but these figures are probably exaggerated. The great mass of the population of Nepal are by some considered to be Mongolic, with large infusions of Dravidian and Aryan blood, while others regard them as a mixed race of Indo-Afghan and Mongolic descent. The chief divisions are the Kulu-lahuli and Paharias in the west, and the Mangars and Gurkhas in the east. Some of the hill-tribes have, perhaps, more of Mongolian than other blood, but the effects of the Hindu invasions from the twelfth century down are seen everywhere. The typical representatives of the Nepalese are the Gurkhas (q.v.), whose Aryan ancestors from Rajputana mixed with the aborigines. In religion the majority of the Nepalese are Hindus, but there are also several hundred thousand Buddhists. The Kulu-lahulis are dolichocephalic and below the average in stature. Education is entirely in the hands of the priests and the bulk of the population are illiterate. The children of the wealthy classes are sent to the educational establishments of British India. Capital, Khatmandu (q.v.).

HISTORY. Various ruling dynasties from a remote period are given in the native literature, but the first authentic mention of a ruler—Ancuvarma of the Thakuri dynasty—is made by Hiuen Tsang, the Chinese Buddhist pilgrim, who visited Nepal in the seventh century. In 1324 the country was invaded and occupied by Harsingha-deva, Raja of Simraungarh. Modern history begins in 1768 with its conquest by the Gurkhas, who originally were driven from Rajputana by the Mohammedan invasion. Gurkha aggressions on Tibetan territory in 1790 led to their defeat by China, and the limitation of their northern boundary. In 1814, by way of reprisals, the British invaded the country, but were defeated; the following year, however, advancing on

Khatmandu, they obtained favorable conditions of peace and the establishment of a British Residency at the capital. By the assassination of his uncle in 1845, and by the Kot massacre of his opponents in the following year, Jung Bahadur, a colonel in the army, became Prime Minister and nominal ruler. Having firmly established himself in power, he visited England in 1850, and after his return the fruits of his journey were exhibited in the wise reforms that he introduced. During the Indian Mutiny of 1857 he rendered valuable assistance to the British and was handsomely rewarded. He died in 1877 and was succeeded by his brother, who also resorted to wholesale executions to maintain his ascendancy, and ruled until 1885, when he was murdered at the instigation of Bir Shamsheer Jang, now Prime Minister and father-in-law, by two daughters, of the reigning Maharaja, Pirthivi Bir Bikram, who was born in 1875 and ascended the throne in 1881.

NEPENTHE, né-pén'thé (Gk. *νηπενθής*, *nē-penthēs*, from *νη-*, *ne-*, negative prefix + *πένθος*, *penthos*, grief). In the *Odyssey*, an epithet of a drug given to Helen in Egypt, possessing the power to bring forgetfulness of every pain or grief. Later writers identified the drug with opium, or some preparation of hemp.

NEPENTHES, né-pén'théz. A genus of herbs or half-shrubby plants of the natural order Nepenthaceæ. The species are natives of swampy ground in India, China, Malaysia, Madagascar, etc., and are chiefly remarkable for the leaves of

some species which consist of a dilated foliaceous petiole, prolonged beyond its foliaceous part, as if it were the prolongation of the midrib of a leaf, and terminating in a pitcher (ascidium), from which the name pitcher-plant has been derived. The pitcher is terminated by a lid, which is regarded as the true blade of the leaf. The fluid found in these pitchers is a secretion of the plant itself. Insects often enter the pitcher, and according to investigations of Vines, are dissolved by a ferment se-

A CULTIVATED VARIETY OF NEPENTHES.

creted by the leaves and absorbed; so that the nepenthes rank among insectivorous plants. Many of the species are epiphytes, being attached to trees and other plants, and are rather commonly grown in hothouses for their strange leaves. The name pitcher-plant is applied to many other

plants, as *Sarracenia* spp., *Arisæma triphyllum*, etc.

NEPHELENE SYENITE (*nephelene*, from Gk. *νεφέλη*, *nephelē*, cloud + *syenite*), *Laurvigite*. An igneous rock of granitic texture, of which the essential mineral constituents are nephelene and alkali feldspar. Nephelene syenites usually contain also an alkaline variety of pyroxene (acmite or ægerine), and frequently also nosean or haüyne, sodalite, sphene, and peculiar varieties of mica (lepidomelane) and garnet (melanite). These minerals are so generally found together, and so rarely occur except when in association with nephelene or the allied mineral leucite, that the nephelene syenites and a few rare families of rocks (leucite syenites, theralites) are quite marked in their peculiarities. Nephelene syenites are very rich in the alkalis and alumina. They are quite subject to alteration by weathering processes.

NEPHELITE (from Gk. *νεφέλη*, *nephelē*, cloud). A mineral sodium-aluminum silicate that crystallizes in the hexagonal system, has a vitreous or greasy lustre, and is generally colorless or light yellow, though sometimes when found massive it is green or red. It occurs in both ancient and modern volcanic rocks, and in such as syenite. It is found in the lavas of the volcanoes of Italy; also in Bohemia, in France, in Brazil, and in Canada; in the United States the massive and crystallized varieties are found in Maine, New Jersey, in the Ozark Mountains (Arkansas), and in Montana.

NEPHELIUM. A genus of plants. See **LITCHI**.

NEPHI, nē'fi. A city and the county-seat of Juab County, Utah, 87 miles south of Salt Lake City; at the junction of the Oregon Short Line and the Sanpete Valley railroads (Map: Utah, B 2). It is the distributing point for a district interested chiefly in farming, lumbering, and cattle-raising, and in the mining of salt and gypsum. Population, in 1890, 2034; in 1900, 2208.

NEPHOSCOPE (from Gk. *νέφος*, *nephos*, cloud + *σκοπεῖν*, *skopein*, to view). An instrument used by meteorologists for observing the clouds, and especially for determining the amount and direction of the horizontal component of the apparent motion of a cloud. The modern nephoscope is the development of an idea embodied by Aimé in 1846, in his so-called 'reflecting anemometer,' and in its best form it has a wide range of usefulness. The simplest form is merely a horizontal mirror, having a circular graduated edge. The observer brings one eye to such a position that the reflected image of the cloud is seen to pass from the centre of the mirror to the circumference, and he merely records the direction in which the image appears to pass off. The Marvin nephoscope, an instrument of high precision, is used by the United States Weather Bureau observers, and has been extensively employed in cloud observations. A form of nephoscope for use on vessels at sea was devised by Professor Finemann and used by him about 1888. About the same time Professor Abbe devised his marine nephoscope and a method of using it for determining absolute altitudes and movements of clouds at sea. It consists essentially of a light bronze circle fitting rather loosely

on top of the ordinary ship's compass; it therefore replaces the nearly horizontal circle of the apparatus ordinarily used by the navigator to sight upon the sun when measuring azimuths. The bronze circle is graduated, and at its zero point carries a hinge and an adjustable arm, having at its end a knob which serves to define the line of sight. The circle also carries a glass mirror from which the quicksilver backing has been removed, leaving a transparent circle, through which the graduation of the compass needle can be read. As this marine nephoscope enables one to locate a storm centre by the motions of the lower clouds better than can be done by the wind, and as it gives the direction of the pennant at masthead much more accurately than it can be observed by the unaided eye, it is strongly recommended for use by navigators at sea. To ordinary meteorological observers it has the special advantage of being the only instrument by means of which observers at sea can easily determine the absolute altitude and movements of clouds.

BIBLIOGRAPHY. A full account of various forms of nephoscopes is given in Abbe, *Treatise on Meteorological Apparatus and Methods* (Washington, 1888), published as part 2 of the *Annual Report, Chief Signal Officer for 1887*. The Marvin nephoscope is described in the *Monthly Weather Review*, vol. xxiv. (Washington, 1896), and also in separate pamphlets. The description of Abbe's marine nephoscope was first published in 1893 in the *Report of the International Meteorological Congress* held in Chicago (*Weather Bureau Bulletin* ii.). A general description of work done with it is contained in the *American Meteorological Journal* for October, 1891.

NEPHRECTOMY (from Gk. νεφρός, *nephros*, kidney + ἐκτομή, *ektomē*, excision, from ἐκ, *ek* + τομή, *tomē*, a cutting, from τέμνω, *temnein*, to cut). The total removal of a kidney in rare cases of acute or chronic infection, either because the kidney is useless or because it is a source of infection owing to abscesses in its substance. The oblique extraperitoneal lumbar incision is the operative procedure of choice. Cutting through the lumbar muscles obliquely from the outer border of the sacro-lumbalis muscles, an inch below and parallel to the twelfth rib, making his incision downward and forward, the surgeon reaches the kidney. Blunt dissection frees it from its site and divests it of its capsule. Its pedicle is then tied and it is separated and removed. There is considerable danger from hemorrhage of the vessels of the pedicle. Tuffier states the mortality as follows: Primary nephrectomy, 371 cases, 36.8 per cent.; lumbar nephrectomy, 200 cases, 28.4 per cent.; secondary nephrectomy following nephrotomy (q.v.), 36 cases, 13.9 per cent. Garceau gives the mortality of nephrectomy for tuberculosis as 17.4 per cent., of secondary nephrectomy following nephrotomy, 11.9 per cent. Consult Warren-Gould, *International Text-Book of Surgery* (Philadelphia and London, 1902).

NEPHRITE (from Gk. νεφρός, *nephros*, kidney). A variety of amphibole that varies from white to dark green in color, according to the amount of ferrous oxide that it contains. It is known chiefly through the carved ornaments and utensils that are found among the remains of primitive man in various parts of the world, es-

pecially in China and Mexico, and known under the collective name of *jade* (q.v.). Many imaginary virtues were ascribed to it, and it was especially sought after as a cure for epilepsy and diseases of the kidneys.

NEPHRITIS. See BRIGHT'S DISEASE; CIRRHOSIS.

NEPHROTOMY (from Gk. νεφρός, *nephros*, kidney + τομή, *tomē*, a cutting). The operation of cutting open a kidney for the purpose of removing a stone or evacuating pus. An incision is made in the lumbar region, obliquely, from the outer border of the sacro-lumbalis muscle, an inch below the twelfth rib, parallel to the rib and forward and downward. The kidney is reached by the finger, and then the incision is modified as the nature of the case demands. The organ being grasped and drawn into reach, after blunt dissection, the surgeon bisects it through its convex edge, removes the calculi, and evacuates the pus. The viscus is then sutured together and replaced. Tuffier gives the results of the operation in these figures: In 43 cases there were 3 deaths, 2 fistulæ, and 38 recoveries. Consult Warren-Gould, *International Text-Book of Surgery* (Philadelphia and London, 1902).

NEPHTHYS (Lat., from Gk. Νέφθις, Egyptian *Nebt-hat*). An Egyptian goddess, the daughter of Seb and Nût, and the sister and wife of Set (q.v.). By her brother Osiris, she was the mother of Anubis (q.v.). In the legend she joins with her sister Isis in mourning over and guarding the body of Osiris, and therefore in funerary scenes the two goddesses are often depicted protecting the mummy of the deceased. The lamentations of Isis and Nephthys over the body of Osiris form the subject of a poem of which several copies have been preserved. Nephthys is usually represented as a woman wearing upon her head the ideogram of her name. As a protector of the dead from evil influences she was worshiped throughout Egypt. Consult: Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897); Horrack, *Lamentations d'Isis et de Nephthys* (Paris, 1866).

NEPI, nā'pē. An episcopal city in the Province of Rome, Italy, 17 miles southeast of Viterbo (Map: Italy, G 5). It is the Etruscan Nepete and the Roman Colonia Nepensis. The town is encircled by its ancient walls and towers, and has an eleventh-century cathedral, a ruined castle, the residence of Lucretia Borgia in 1500, and a handsome Renaissance municipal palace. Population, in 1901, 3036.

NEPISSING, LAKE. A lake of Canada. See NIPISSING, LAKE.

NEPOMUK, nā'pō-muk, JOHN OF. See JOHN OF NEPOMUK.

NEPOS, CORNELIUS. A Roman historian, who flourished about the middle of the first century B.C. The place and precise time of his birth are unknown. He was the friend of Cicero and Catullus. The only work of his which has survived (if indeed it be his) is a series of twenty-five generally brief biographies of warriors and statesmen, mostly Greeks. These biographies are distinguished by the purity of their Latinity, the conciseness of their style, and their admirable delineation of character, but sufficient care has

not been exercised in the examination of authorities, nor is the relative importance of things duly regarded. Until the middle of the sixteenth century, these biographies, on the strength of the titles given in the various manuscripts, were generally ascribed to Æmilius Probus, a writer who lived in the latter part of the fourth century; but in 1569 an edition was put out by the famous Dionysius Lambinus, who pronounced the so-called *Lives* of Æmilius Probus to be in reality the lost work of Cornelius Nepos, *De Viris Illustribus*. There are many editions, among which may be mentioned those of Van Staveren (Leyden, 1773), of Tzschucke (Göttingen, 1804), of Fleckeisen (Leipzig, 1884), of Nipperdey (10th ed., Leipzig, 1896), of Lindsay (New York, 1895), and of Flagg (New York, 1895).

NEPTUNE (Lat. *Neptunus*; connected with Av. *nāpa*, moist), or **POSEIDON** (Gk. Ποσειδών, *Poseidōn*, Doric Ποσειδάων, *Poteidavōn*, Ποσειδᾶν, *Poteidān*; of uncertain etymology). In classical mythology, a brother of Zeus and lord of the sea. In legend he is the son of Cronus and Rhea. His home is a splendid palace in the depths of the sea near Æge, though which town of this name was meant caused much dispute. His wife in Hesiod is Amphitrite, and she shared his cult on the Isthmus. As a lover he rivals his brother Zeus, and many legends traced local heroes to Poseidon and some nymph or daughter of an early king. So Neleus and Pelias were sons of Poseidon and Tyro. In his nature Poseidon is always wild and implacable, never becoming a guardian of higher virtues. He is the 'shaker of the earth,' a natural conclusion from the frequency with which disturbances of the sea accompany the shocks on land, but he is, above all, the master of the sea, who sends the dreaded storms, and at his will controls the waves, which are called his swift horses. His attribute is the trident, or three-pronged harpoon of the Ægean fisherman, with which he controls the waves, or brings springs from rocks. Closely associated with him is the horse. He was the horse-tamer, was honored with horse-races at many points, horses were frequently sacrificed to him, and there are traces of a belief that he was in the form of a horse. His worship was chiefly confined to the coast, though he had temples even in the inland country of Arcadia, and it is not at all improbable that he was originally a god of water and moisture in general. There is some evidence for a decline in Poseidon worship, which seems reflected in the legends of his contest with Athena for Attica and with Hera for Argos. At Athens he was worshiped in the Erechtheum, and it seems clear that both Erechtheus and Ægeus are in essence the same deity. From him was also named the Attic month Poseideon (about December). He was a great Ionian divinity, and the Panionia were celebrated by the twelve Ionic cities at his sanctuary at Mycale. His temple on the island of Calauria, where Demosthenes died, was in very early times the centre of an amphictyony or league of maritime States. His most famous cult, however, was on the Isthmus of Corinth, where the *Isthmian Games* were celebrated in his honor. In art Poseidon has much the same type as Zeus, but without the dignity and benignity of the latter. Statues of him are by no means common. Two of the best are the Poseidon of Melos, now in Athens, and the fine statue in the Lateran, which many regard as de-

rived from the famous bronze by Lysippus on the Isthmus.

At Rome the old Italian or Roman water-god, who appears dimly in religious tradition, seems to have been early identified with Poseidon, and during the historical period Neptune is scarcely distinguishable from the Greek god of the sea.

NEPTUNE. The outermost member of the solar system. Its mean distance from the sun is 2,792,000,000 miles; its diameter 34,800 miles; period of revolution about 165 solar years; mass seventeen times that of the earth; density one-fifth of the earth's. Thus, it is about eighty-five times larger than the earth, but from its extreme remoteness is of almost inappreciable magnitude when seen through an ordinary telescope.

DISCOVERY. The discovery of Neptune was an event unique in scientific history. It was the disturbance in the motion of Uranus, caused by the attractive force of Neptune, which led to its discovery. From 1690 to its discovery as a planet by Herschel, Uranus (q.v.) had been repeatedly recorded as a fixed star. Earlier observations were found not to agree with later observations, and hence it became evident that either the earlier observations were erroneous or that Uranus was wandering from its ancient track. On October 21, 1845, John Couch Adams (q.v.) communicated to the Royal Astronomer estimates of the elements and position in the heavens of a planet, whose mass would account for the orbital irregularities of Uranus. This did not, however, lead to any search for the planet in the heavens, and the matter remained buried in obscurity. In the same year the attention of Jean Joseph Leverrier (q.v.), a teacher of astronomy in the Ecole Polytechnique, was brought to the Uranian difficulty. In two papers communicated to the French Academy, Leverrier proved that only an exterior body could produce the irregularities in the Uranian orbit. In a third paper, submitted August 31, 1846, he had computed the orbit of the supposed planet, the visibility of which he described as that of a star of the eighth magnitude. These results were communicated to Galle of the Berlin Observatory, with a request to look for the planet in the place assigned to it. This Galle did in the evening of September 23d, and perceived a small body with a disk nearly 3" in diameter. The place where it was found was within less than 1° of the spot indicated. Before the news of the discovery reached England, it had already been duplicated. Under the direction of Airy, director of the Greenwich Observatory, Challis of the Cambridge Observatory had commenced a search for the planet July 29th, and recorded 3150 stars, three of which were different positions of the planet, recorded on August 4th, August 12th, and September 29th. Challis proceeded to map them, but as he had no good star map this required considerable time, and before this was accomplished, news of the discovery arrived from Berlin on October 1, 1846. Neptune had already been seen by Lalande on the 8th and again on the 10th of May, 1795, but was taken to be a fixed star and repeatedly entered in the catalogues as such till its discovery as a planet.

Neptune is attended by one satellite, which was discovered October 10, 1846, by Lassell. This satellite, like those of Uranus, differs from the satellites of other planets in the direction of its

motion, which is from east to west in a plane inclined at an angle of 35° to that of the ecliptic. Its period of revolution is 5 days 21 hours, and its distance from the planet somewhat less than that of our moon from the earth. For a complete account of the discovery of Neptune, consult Clerke, *History of Astronomy During the Nineteenth Century* (London, 1890). See PLANETS; SOLAR SYSTEM.

NEPTUNE, TEMPLE OF. (1) A remarkably preserved and majestic Doric temple at Pæstum, originally called Posidonia, in Lucania. The temple is a peripteral hexastyle, and measures 120 by 85 feet. The cella is surrounded by a passageway, and has two columns in *antis* at front and rear. The temple stands on a platform of three steps.

(2) A temple forming part of a group of buildings erected on the Campus Martius at Rome, in B.C. 26, by Agrippa in commemoration of the victories at Mysæ, Naulochus, and Actium. It stood in the midst of a great square surrounded by a colonnade, the Portico of the Argonauts, which was decorated with naval paintings. The whole group was called the Neptunium, and was the seat of the Admiralty. It was destroyed in the great fire of A.D. 80, and was restored by Hadrian. Eleven columns of the temple, with a part of the cella and decorated ceiling, are still preserved. The substructure, now buried, bore under each column the figure of a Roman province, with trophies between the columns, of which there were thirty-six, corresponding to the number of Roman provinces at the time of Hadrian. A number of the figures have been recovered, but are dispersed in various collections. The cornice is mistakenly restored with a copy of the cornice of the Temple of Concord.

NEPTUNIAN (from Lat. *Neptunius*, relating to Neptune, marine, from Lat. *Neptunus*, name of the Roman sea-god). A term formerly applied to the geologists who maintained the aqueous as against the igneous theory of the origin of rocks. The discussions between the two schools were long and bitter.

NÉRAC, nã'rãk'. The capital of an arrondissement in the Department of Lot-et-Garonne, France, on the Baise, 16 miles southwest of Agen (Map: France, G 7). The old town on the right bank of the river is united by bridges to the modern industrial quarter on the left bank. The ruins of its former imposing royal castle, now numbered among French historical monuments, and its park of La Garenne, are the chief objects of interest, and there is a small but interesting museum containing numerous remains, indicating the presence of an unknown city of Roman days on the site of Nérac. Corks, machines, coaches, and cloth are manufactured, and there is a general trade in wine, grain, and hemp. Here Henry IV., to whom there is a monument, spent his youth. Population, in 1900, 6435.

NERBUDDA, nãr-bûd'dã, more correctly **NARBADA** (Skt. *Narmada*). A river of India. It rises in the Maikal Range in the northern part of the Central Provinces, and flows southwestward for 800 miles, emptying into the Gulf of Cambay through an estuary beginning at Broach, 200 miles north of Bombay (Map: India, C 4). In the upper half of its course, below Jabalpur, it flows through a great depression between the Vindhya Mountains on the north and the Satpura range on the south, and is broken by numerous

falls and rapids. In this valley, near Hoshangabad, are important deposits of coal and iron ore. In its lower course the river is broad, and becomes a tidal stream 50 miles from its mouth. Sea-going vessels ascend the estuary to Broach, and the river is navigable 82 miles for large boats, while smaller ones can ascend 28 miles farther. The Nerbudda is to the Hindus one of the most sacred streams of India.

NEREID (nẽ'rẽ-id) **MONUMENT.** The name given to a sculptured heroön at Xanthus in Lycia, dating from the fourth century B.C., and discovered in 1838 by Sir Charles Fellows. The sculptures from the monument, preserved in the British Museum, show ten female figures with dripping garments, which, with the shells and seaweed represented, gave the monument its name.

NEREIDS (Gk. *Nηρηίδες*, *Nηρηίδες*, *Nērēides*). Sea-nymphs, daughters of Nereus and Doris, daughter of Oceanus. Their number is variously given, though fifty seems to have been the popular belief. We have, however, in the various lists some seventy-seven different names. Few of them appear as individuals, and of these Thetis, mother of Achilles, Amphitrite, the wife of Poseidon, and Galatea, beloved by the Cyclops Polyphemus, are alone conspicuous. In art they appear frequently as spectators in scenes involving sea-deities, as at the contest between Nereus and Hercules, or the capture of Thetis by Peleus, while a favorite scene represents them as bringing to Achilles the armor made by Hephæstus. In the later art they appear riding on various sea-monsters, sporting with Tritons, or attending on Poseidon and Amphitrite. The name has continued in the popular belief of the Greeks of to-day, but the Nereids are no longer sea-maidens, but have become nymphs of the land. The stories are in part such as correspond with the ancient ideas, but in many tales they appear as dangerous and vindictive spirits, carrying away children, or, vampire-like, sucking human blood. In summer they are supposed to be especially dangerous at mid-day, seizing their victims by a sudden stroke or destroying their senses. The old belief that whoso saw a nymph might be smitten with madness reappears in the modern popular superstition, and it is thought dangerous to haunt their caves, and still more to be caught in the whirlwinds of dust raised in their dances.

NEREIS. A genus of annelids (family *Nereidæ*) having a long slender body, a distinct head, with tentacles and eyes, the whole body covered with tubercles, and the gills lobed and tufted. They are all marine, and generally hide under rocks or in the sand. They swim actively by rapid and undulating inflections of the body, and by the aid of numerous 'oars' (*setæ*) arranged along the sides. The proboscis is thick, strong, and armed with two jaws.

NEREITES, nẽrẽ-i'tẽz (Neo-Lat., from Lat. *Nereis*, Nereid). A peculiar fossil trail found in many of the Cambrian rocks of America and Europe, and supposed to have been made by a crawling worm.

NEREUS, nẽ'rẽ-ûs or nẽ'rẽ-ûs (Gk. *Nηρεüs*). In Greek legend, an ancient sea-divinity, son of Pontus (sea) and Gæa (earth), and father, by Doris, of the Nereids. He seems to have been worshiped at Gythium, and probably elsewhere; but his cult was never prominent, and in legend

he plays scarcely any other part than father of the Nereids, among whom was included Thetis, mother of Achilles. In the myths he is usually friendly and helpful, and his only contest is with Hercules, who, in order to learn the way to the Garden of the Hesperides, was obliged to wrestle with and hold Nereus, in spite of his manifold changes of shape.

NER'GAL. A prominent deity in the Babylonian and Assyrian pantheons. The name (probably better, Nergal) is assured by the Old Testament; its meaning is obscure ('the rager,' or 'the great ruler'), the Babylonian etymologists explaining it as 'the mighty one of the great dwelling-place,' with reference to Nergal's lordship over Hades. His original aspect seems to have been that of a solar deity, representing especially the blazing heat of the sun at noon or the summer solstice; thus he is referred to as 'the hero of the gods, the lofty meridian sun.' As a destructive deity he became the god of war and the god of pestilence. He shares the former characteristic with Ninib, along with whom he also appears as the god of the chase. But he appears more uniquely as the god of pestilence, and so he became by an easy transition of thought the god of those whom he destroyed, and thus the deity of the lower world. Accordingly in the later mythology he stood for the declining sun, and the month of Chislew (December) is dedicated to him. This development in the character of Nergal is presented in a story preserved in an Amarna tablet, to the effect that the gods of the upper world became engaged in war with Allatu (Eresh-kigal), the goddess of Hades; Nergal as their leader makes his way into her presence, but is induced by her supplications to save her life and to marry her, so becoming the god of the lower world. With this may be compared the classic myth of Pluto and Proserpine. Nergal had also as wife Laz, probably an upper-world goddess. As god of war and destruction, Nergal was identified with the planet Mars, while the lion was his symbol. Nergal's ancient sanctuary, with which he was always associated from earliest to latest times, was Cutha, the name of which even became a synonym of Hades. Accordingly, the Cuthæan colony which was settled in Samaria after the deportation of Israel brought thither the cult of Nergal (II. Kings xvii. 30). His cult, however, was widespread and seems to have been especially patronized in the later Assyrian Empire. Consult Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898).

NERI, nã'rê, PHILIP. See PHILIP NERI, SAINT.

NERINEA (Neo-Lat., from Lat. *Nerine*, variant of *Nereis*, Nereid). A genus of siphonostomate gastropods allied to the Cerithiidae and exclusively restricted to the Mesozoic formations, where it is especially abundant in and characteristic of the Jurassic coral beds of Europe. The shell is long and turreted, with many whorls, and the columella always, and usually also the inner lip of the aperture, are ornamented with strong ridges. Longitudinal sections of the shell show that these ridges increase in size and complexity from the apex to the aperture of the shell, in other words, as the shell increases in growth from its young to its adult stage.

NERIS'SA. In Shakespeare's *Merchant of Venice*, the companion of Portia. She marries Gratiano.

VOL. XIV.—24.

NE'RIMUM. A subtropical plant. See OLIV-ANDER.

NERLY, nãrlê (properly NEHRlich), FRIEDRICH (1807-78). A German architectural and landscape painter, born at Erfurt, and educated at Hamburg. After studying in Rome for several years, Nerly visited Southern Italy, and in 1837 settled in Venice. Thenceforth he painted, almost exclusively, views in Venice, one of the first being the "Piazzetta by Moonlight," a subject which met with universal favor. A fine view of "San Giovanni e Paolo" is in the National Gallery, Berlin, and mention may be made of a "Team of Buffaloes Drawing a Huge Marble Block Through the Campagna," in the Schwerin Gallery. His son and pupil, FRIEDRICH (1842—), attained distinction as an able landscape and marine painter.

NERNST, nãrnst, WALTHER (1864—). A German physicist, born at Briesen (West Prussia). He studied at the universities of Zurich, Berlin, Gratz, and Würzburg; in 1887 was appointed assistant to Ostwald at Leipzig, and in 1889 lecturer in physical chemistry in the university. In 1891 he became professor at Göttingen, where in 1895 he also organized and became director of the institute for physical chemistry. He is known as the inventor of the Nernst incandescent electric lamp, in which the carbon filament of the ordinary incandescent lamp is replaced by a bar of magnesia, which, unlike the carbon, is efficient at nearly its melting-point, and therefore much superior in illuminating power. The cost of operation is also said to be considerably less. See ELECTRIC LIGHTING.

NERNST LAMP. See ELECTRIC LIGHTING.

NE'RO (A.D. 37-68). A Roman Emperor (A.D. 54-68). He was born at Antium, on the coast of Latium, December 15, A.D. 37, and was the son of Cn. Domitius Ahenobarbus and of Agrippina, the daughter of Germanicus Cæsar, and sister of Caligula. His mother afterwards became the wife of the Emperor Claudius, who adopted him (A.D. 50), and his name, originally L. Domitius Ahenobarbus, was changed to Nero Claudius Cæsar Drusus Germanicus. After the death of Claudius (A.D. 54), the Prætorian Guards, at the instigation of Afranius Burrus, their prefect, declared him Emperor, instead of Claudius's son Britannicus, and their choice was acknowledged both by the Senate and the provinces. His reign began under the guidance of Burrus and his tutor, Seneca, the philosopher; but the influence of his mother, together with his own moral weakness and sensuality, frustrated their efforts, and he soon plunged into debauchery, extravagance, and tyranny. He caused Britannicus, the son of Claudius, to be poisoned at the age of fourteen, because he dreaded him as a rival, and afterwards (A.D. 59) procured the death of his own mother, Agrippina, to please his mistress, Poppæa Sabina. She was the wife of his principal boon-companion, Otho, afterwards Emperor, and in order to marry her he divorced and afterwards put to death his wife Octavia, the sister of Britannicus (A.D. 62). The affairs of the Empire were at this time far from tranquil. In A.D. 61 an insurrection broke out in Britain among the Iceni under their Queen, Boadicea, which was, however, suppressed by Suetonius Paulinus. The following year saw an unsuccessful war against the Parthians in Armenia. At home matters

were not much better. The Emperor was lampooned in verse; the Senate and priesthood, alike venal, were also satirized by audacious malcontents; Burrus died, and even Seneca removed from Court. In July, 64, occurred a great conflagration in Rome, by which two-thirds of the city was reduced to ashes. Nero himself is usually believed to have been the incendiary. It is said that he admired the spectacle from a distance, reciting verses about the burning of Troy, but many scholars are doubtful whether he really had any hand in it. At all events, he laid the blame on the Christians, and persecuted them with great fury. He rebuilt the city with great magnificence, and reared for himself a splendid palace extending from the Palatine Hill over the intervening valley to the slopes of the Esquiline, called, from the immense profusion of its golden ornaments, the *Domus Aurea*, or Golden House; and in order to provide for this expenditure, and for the gratification of the Roman populace by spectacles and distributions of corn, Italy and the provinces were unsparingly plundered. A conspiracy against him failed in the year 65, and Seneca and the poet Lucan fell victims to his vengeance. In a fit of passion he killed his wife Poppæa. He then proposed marriage to Antonia, the daughter of Claudius, but was refused, whereupon he caused her to be put to death, and married Statilia Messalina, after killing her husband. His vanity led him to seek distinction as a poet, a philosopher, an actor, a musician, and a charioteer, and he received applause, not only in Italy, but also in Greece, which, upon invitation of the Greek cities, he visited in 67. In 68 the Gallic and Spanish legions, and after them the Prætorian Guards, rose against him, proclaimed Galba Emperor, and Nero fled from Rome to the house of a freedman, Phaon, about four miles distant. The Senate, which had hitherto been most subservient, declared him an enemy of his country, and the tyrant ended his life by suicide, June 9, 68.

NERTCHINSK, *nyér'ch'nsk*. A district town in the Territory of Transbaikalia, Siberia, situated on the Nertcha and the Trans-Siberian Railway, 184 miles east of Tchita, the capital of the Territory (Map: Asia, L 3). It is poorly built. It has a museum and a library. The inhabitants are engaged chiefly in the cultivation of tobacco and vegetables, and in the fur trade, of which Nertchinsk is still an important centre. The town was founded in 1656 over a mile from its present site. It soon rose to great importance as the centre of the trade with China. With the rise of Kiakhta (q.v.) Nertchinsk lost in commercial importance, but it soon became the centre of an extensive mining region and received many immigrants, a considerable proportion being convicts. By the Treaty of Nertchinsk, concluded in 1689, the two rivers of Argun and Gorbítsa and the Stanovoi mountain chain were fixed upon as the boundary lines between Siberia and Manchuria. The mining industry in the vicinity of Nertchinsk is now of secondary importance. Population, in 1897, 6713, including about 1200 exiles.

NER'THUS. In Northern mythology, a goddess worshiped by the tribes of Northern Germany, among whom she journeyed at intervals, bringing peace and fertility. Her shrine was an island, sometimes identified with Rügen. She is

also called Hertha, from a former reading of the passage in Tacitus in which she is mentioned.

NĚRUDA, *nyě'ru-dá*, JAN (1834-91). A Bohemian poet and novelist, born at Prague. He was educated at the university in his native city, and began to write under the pseudonym of Janko Hovora. His poetical works belong to the Romantic School, new in Bohemia in his time, and he was influenced by the contemporary movement in the same direction in Germany. His volumes of verse include: *Hřbitovní květy* ("Flowers from the Cemetery," 1858); *Knihy věků* ("Books of Verse," 1868); and *Písně kosmické* ("Cosmic Songs," 1878). He also wrote several plays of lesser importance. Něruda was connected with various newspapers as editor and contributor; he founded the review *Květy* in 1866, and much of his best work appeared in the *Národní Listy*, for which he was feuilletonist from 1865 to 1891. His prose masterpiece, the studies of life in Prague called *Malostranské povídky*, was published in 1878. Others of his sketches and novels are: *Arabský* (1864); *Různí lidé* (1871); *Obrazy z ciziny* (1872); and *Feuilletony* (1876 et seq.), all remarkable for humor, observation, and a style full of charm. His complete works were edited by Herrmann in 1891-99 (Prague).

NERUDA (NORMANN-NERUDA), WILMA MARIA FRANCISCA (1839—). A European violinist, born at Brünn, in Moravia, where her father was organist of the cathedral. She became a pupil of Jansa, and made her first appearance at Vienna, in 1846. In 1849 she went to London to play at the Philharmonic in one of Bériot's concerts. She then returned to the Continent and passed several years traveling as a soloist, chiefly in Russia. In 1864 she visited Paris and played with great success at the Pasdeloup concerts, the Conservatory, and elsewhere. In the same year she was married to Ludwig Normann, a Swedish musician. She returned to London in 1869, again taking part in the Philharmonic; in the winter following she played the first violin at the Monday Popular Concerts; and in 1888 married Sir Charles Hallé, with whom she toured Australia in 1890-91. She visited the United States in February, 1899.

NER'VA, FORUM OF, or FORUM TRANSITORIUM. The fourth of the Imperial fora at Rome, formed from the highway which separated the Forum of Peace from the Forum of Augustus. It was also called Forum Palladium, from the Temple of Minerva (Pallas), of which two Corinthian columns remain, the temple having been destroyed in 1606 to build the Chapel of Saint Paul in the Church of Santa Maria Maggiore.

NERVA, MARCUS COCCEIUS. A Roman Emperor (A.D. 96-98). He was born A.D. 32, of a family belonging to Narnia, in Umbria, and twice held the honor of consulship before his election by the Senate to the dignity of Emperor, after the murder of Domitian. He displayed great wisdom and moderation, rectified the administration of justice, and diminished the taxes; but, finding himself, on account of his advanced age, not vigorous enough to repress the Prætorian Guards, he adopted M. Ulpius Trajanus, then at the head of the Army of Germany, who succeeded him on his death, January 25, 98. After his decease, he obtained an apotheosis.

NERVAL, nâr'vâl', GÉRARD DE. A French writer. See GÉRARD DE NERVAL.

NERVE. See NERVOUS SYSTEM AND BRAIN.

NERVE-STRETCHING. A variety of treatment of sciatica, which is accomplished by putting the patient on his back and flexing the thigh strongly upon the abdomen. It has been successful in alleviating the pain in a few cases. See SCIATICA.

NERVI, nêr'vê. A town in the Province of Genoa, Italy, situated on the seacoast, six miles east of Genoa. It is a favorite winter health resort of the eastern Riviera. Population (commune), in 1901, 6766.

NERVII, nêr'vi-i. An ancient tribe in Gallia Belgica, north of the Ambiani. In the time of Cæsar, who first mentions them, they were a warlike people, who prohibited trade with their neighbors, forbade the introduction of luxuries, and attempted to make an alliance of the surrounding tribes against the Romans. Cæsar subdued them in B.C. 57.

NERVOUS DISEASE. An affection of any part of the nervous system, either of the brain, spinal cord, sympathetic nerves, or peripheral nerves. Diseases of the nervous system are divided into functional and organic. In the latter local anatomical alteration of nerve structure is apparent. There are in reality no such things as functional diseases. While not seen or described, undoubtedly anatomical changes are present in many cases; and in others there are lesions at a distance which constitute the real disease, while the symptoms which occupy the attention are the result of reflex action. It cannot be affirmed that there are no structural changes in nerve-fibres in so-called functional diseases of the nervous system, which constitute the bulk of nervous diseases. There are 176 special nervous diseases, classed as follows: peripheral, 87; spinal cord, 40; brain, 28; and functional, 21. Of these there are about 65 which are either very common or extremely important (Dana). In their proper place are found articles on the following nervous diseases or conditions: ACROMEGALY; APOPLEXY; CAISSON DISEASE; CATALEPSY; CHOREA; EMBOLISM; EPILEPSY; FACIAL NEURALGIA; GOITRE; HYSTERIA; INSOMNIA; LOCOMOTOR ATAXIA; MENINGITIS; MYELITIS; NEURASTHENIA; NEURALGIA; NEURITIS; NEUROSIS (including *occupation neuroses*); NEUBOTIC; PARALYSIS; SCLEROSIS; SLEEPING SICKNESS; THROMBOSIS, etc. There is also an article on NEUROLOGY. In addition there are articles in the domain of psychiatry, on INSANITY; MANIA; MELANCHOLIA; MONOMANIA; PARANOIA; PARESIS; KLEPTOMANIA; DIPSO MANIA; PYROMANIA; PUEPERAL INSANITY, etc., as well as on IDIOCY and IMBECILITY.

Consult: Starr, *Familiar Forms of Nervous Disease* (New York, 1895); Charcot, *Clinical Lectures on Certain Diseases of the Nervous System*, translated by Hurd (Detroit, 1888); Hirt, *The Diseases of the Nervous System*, translated by Hoch (New York, 1893); Gowers, *Manual of Diseases of the Nervous System* (London, 1899); Beevor, *Diseases of the Nervous System* (Philadelphia, 1898); Church and Peterson, *Nervous and Mental Diseases* (ib., 1901); Dana, *Text-book of Nervous Diseases* (New York, 1901);

Oppenheim, *Lehrbuch der Nervenkrankheiten* (Berlin, 1902).

NERVOUSNESS. A condition of unstable nervous equilibrium, which is largely temperamental. A person afflicted with nervousness startles easily at sudden sounds, is unduly emotional, lacks poise and self-possession. If the condition go beyond these limits, actual disease is present, and the person is a neurasthenic, i.e. a sufferer from nerve fag. This state is characterized by unfounded feelings of apprehension, tremor, headache, disordered digestion, insomnia, loss of power of application, and irritability. Overwork, excesses, and disease may cause nervousness in normally stable people, which disappears when the cause is removed.

NERVOUS SYSTEM AND BRAIN. HISTORICAL. It is impossible in an article such as the present to do more than touch upon some of the more important investigations which have brought us to our present conception of nervous system structure. To the philosopher Descartes, in the latter part of the sixteenth century, belongs the honor of the first recorded description which gives any intelligent conception of the structure of the nervous system. His drawings of the brain possess a very fair degree of accuracy as regards general shape, though the lobes and convolutions appear much distorted. He pictured the nerves as originating in the brain and described their function as the carrying of the 'animal spirits' from the brain to the periphery. For the next two hundred and fifty years little progress was made in the study of the structure of the nervous system, though some work was done upon the gross anatomy of the brain by men whose names remain to us in our anatomical nomenclature. Thus, Vesalius, Fallopius, and Eustachius were among the earliest. In the seventeenth century we have Willis, whose name we recognize in the circle of Willis, and who described the basal ganglia, the pyramids and the olives; Vieussens, whose name is familiar in the valve of Vieussens; and Duboise, whose medical cognomen of 'Sylvius' marks that prominent sulcus of the cerebrum. The results of the labors of these investigators, as well as of those of Van Leeuwenhoek, of Malacarne, of Rolando, of Vico d'Azyr, of Arnold, of Monro, and others were collected and summed up in an extensive volume published by Burdach in 1819. Descartes had discovered the nerve fibre, and the next step forward in the histology of the nervous system was not taken until Ehrenberg in 1833 discovered the nerve cell in the spinal ganglia. This discovery was emphasized when four years later Purkinje observed the presence of cells not only in the ganglia, but in the cerebrum and cerebellum. The important fact that the dorsal roots of the spinal nerves are concerned with sensation and the ventral roots with motion was discovered by Sir Charles Bell, an eminent British surgeon and anatomist, and communicated by him to the Royal Society of London about 1820. In 1834 Remak discovered that the cells of the sympathetic ganglia had processes, and that these processes were connected with nerve fibres. The importance of this discovery, confirmed in 1842 by Helmholtz, was not at the time appreciated. One of the most careful studies of nerve cells and their processes was made by Otto Deiters of Bonn and published after the

investigator's death by Max Schultze in 1865. Deiters divided the processes given off from nerve cells into two kinds, protoplasmic processes, which branched rapidly and the structure of which resembled that of the cell body, and axis cylinder processes or nervous processes which were often continuous with the axis cylinders of medullated nerves. Gerlach's publication in 1872 was far-reaching in its influence. By the use of the chloride of gold method, he was able to demonstrate many more and finer processes of nerve cells than had been recognized by the older methods of staining. These delicate processes were believed by Gerlach to form a diffuse nervous network within the gray matter. Besides describing this nervous network, Gerlach built up upon this as a basis a theory of nervous system structure which was accepted by most neurologists until the advent of the so-called 'newer investigations.' Gerlach believed that from the anterior horn cells of the spinal cord, processes passed directly off to form the motor roots of the spinal nerves. According to his theory the protoplasmic processes of these cells ramified in the gray matter of the cord, where they anastomosed with protoplasmic processes from other cells, forming a reticulum from which arose the fibres which passed out of the cord as the posterior or sensory roots. Gerlach believed that this same relation of afferent and efferent fibres to the nerve cells and to the reticulum obtained throughout the entire nervous system, which thus consisted of a remarkably complex continuum of nervous protoplasm.

The so-called 'newer investigations' upon which is based our present conception of the structure of the nervous system must be considered as beginning with the discovery by Golgi of the staining method which bears his name. This was announced by Golgi in 1873, although it was not until ten years later, when Golgi published a considerable volume of his investigations, that the neurological world began to realize the importance of his discovery. To the investigations since that time of Golgi, His, Kölliker, Van Gehuchten, Forel, Retzius, Ramón y Cajal, Von Lenhossek, and others must be ascribed the overthrow of Gerlach's theory of a diffuse nervous network and the establishment upon a firm basis of the at present accepted neurone theory of nervous-system structure.

METHODS OF NEUROLOGICAL INVESTIGATION. The history of the development of our knowledge of the structure of the nervous system is necessarily intimately associated with the history of advances in methods of investigation. Among the general methods which have proved of greatest value in working out the structure of the nervous system the following may be mentioned:

(1) **Method of Anatomical Dissection.**—Only the coarser fibre tracts can be determined by this method, its main use being in studying the gross anatomy of the nervous system. (2) **Method of Embryology.**—The extreme value of this method is shown by the important investigations of His. By means of this method it is possible to study the development of the neurone from its first appearance to its adult condition and to observe how groups of neurones become separated off by themselves to form the different parts of the nervous system. Of especial importance is the fact that the fibres of different systems of neurones acquire their medullary sheaths at different em-

brionic ages. In this way it is possible, by studying the nervous systems of embryos of different ages, to differentiate many of the fibre systems. (3) **Method of Pathology.**—This is based upon the fact that any disease or injury which destroys the cell bodies of neurones, or which interrupts the continuity of their axones, causes degeneration in the axones whose cells are destroyed or whose continuity is interrupted. Thus, e.g. in an injury crushing the spinal cord at a certain level, there will be found degenerated above the point of injury all fibres whose cells lie below the injury, while below the injury there will be found degenerated all fibres whose cells lie above the injury. More recently it has been determined that not only does the distal portion of a cut nerve or cut fibre tract die, but that in disease of peripheral nerves changes take place in the central stump and in the cells from which the diseased axones originate. It has thus been possible in some cases to determine the cells from which diseased nerves originate. (4) **Method of Arrested Development.**—This method depends upon the fact that there sometimes occur abnormalities in the nervous system such as absence or malformation of a part, thus causing an absence of development in other parts dependent upon them. (5) **Method of Animal Experimentation.**—This method consists essentially in subjecting animals to certain conditions which cause changes in the nervous system and then studying those changes.

Most of our knowledge of the nervous system has been acquired by the application to the above general methods of certain special staining methods. Of these the four most important are the method of Weigert, the method of Golgi, the method of Nissl, and the method of Ehrlich. For the details of these methods the reader is referred to text-books on histology and histological technique.

ANTERIOR PORTION OF THE BODY OF A CHICK.

DEVELOPMENT. The differentiation of the nervous system begins very early in embryonic life. There is first the formation of a groove or furrow in the outer layer of the blastoderm. This is known as the medullary or neural groove. By an increase of the cells at the sides of the groove and their union dorsally, this groove is converted into a closed canal, the neural or medullary canal. This canal corresponds to the central canal of the spinal cord and to the ventricles of

the brain in the adult nervous system, and it is from the epiblastic cells surrounding the medullary canal that the entire nervous system is developed. At that end of the canal which corresponds to the head of the embryo, three dilations appear. These are known respectively as the fore-brain (anterior cerebral vesicle—telencephalon), the mid-brain (middle cerebral vesicle—mesencephalon), and the hind-brain (posterior cerebral vesicle—metencephalon). These three vesicles soon become five from the development from the fore-brain of the interbrain or dien-cephalon, and from the hind-brain of the after-brain or myelencephalon. From the anterior cerebral vesicles are developed the cerebral hemispheres, the corpus striatum, the optic thalami, and posteriorly, as far as the anterior corpora quadrigemina. From the middle cerebral vesicle are developed the corpora quadrigemina and the cerebral peduncles. From the posterior cerebral vesicles are developed the cerebellum, pons, and medulla oblongata. From the remaining undil-

processes is what is known as the 'neurone.'

NERVOUS TISSUE. The structural element of nervous tissue is the neurone. This has already been defined as the nerve cell with all its branches. These neurones in their association with one another to form the organs of the nervous system are supported by a peculiar type of connective tissue called neuroglia. As noted above in describing its development, each adult neurone consists of a cell body, and passing off from this two kinds of processes, the axis cylinder process and the dendritic processes. The cell body, as in most other cells, consists of a mass of protoplasm containing a nucleus.

Our knowledge of the internal structure of the nerve cell has been greatly enhanced within the last few years by the application of a new method known as the method of Nissl. This method consists essentially in placing fresh tissue in some quick fixative such as absolute alcohol, and staining sections with such a dye as methylene blue. This method demonstrates two very different types of cell in the nervous tissues. In one of these the nucleus alone stains, the cell body remaining unstained; in the other, both nucleus and cell body are stained. The former are known as caryochrome cells, the latter as somatochrome cells. The structure of a somatochrome cell as shown by the method of Nissl is as follows: The rather large nucleus situated in the centre of the cell differs in no essential from the nuclei of other cells. It is surrounded by a nuclear membrane and traversed by an intranuclear network, both of which stain blue. The nucleoplasm or basement substance of the nucleus remains unstained. Within each nucleus is a darkly staining nucleolus. The body of the cell shows three distinct elements in its structure, a basement substance, a cytotreticulum or fibrillar element, and chromophilic bodies. The basement substance is unstained by Nissl's method and appears homogeneous. Traversing this basement substance may be seen very delicate fibrils. These are described by some investigators as fibrillæ passing through the cell body, by others as a definite reticulum. This reticulum or fibrillar structure extends not only throughout the body of the cell, but also into the dendrites and into the axis cylinder, possibly as far as these processes themselves extend. The chromophilic bodies are blue, staining granular masses scattered throughout the cell body. The size and arrangement of these bodies differ greatly for different cells, and are quite characteristic for certain types of cells. In addition to the elements al-

TWO FORMS OF MULTIPOLAR NERVE CELLS.

From the ventral horn of the spinal cord of a new-born rabbit, showing the richly branched protoplasmic processes. (Schaper.)

ready described, there is present in many nerve cells more or less yellow or brown pigment. This pigment is absent in the nerve cells of the new-born child. The internal structure of the dendrites is similar to that of the cell body. They usually branch rapidly and end in the gray matter near their cell of origin. The method of Gogli shows them to be covered with little knob-like projections known as 'gemmules.' The axon differs from both cell body and dendrites in that it contains no chromophilic bodies. It arises from a portion of the cell called the axone hill, which is also free from chromophilic bodies. In Golgi preparations the axon is distinguished by

its fineness, its straight course, approximately uniform diameter, and its few branches. These few branches pass off at right angles and are known as collaterals. In some cells the axone branches rapidly and ends in the gray matter near its cell of origin. Other axones pass into the white matter and become axis cylinders of nerve fibres. At its origin from the cell body and at its termination, the axone is uncovered by any sheath. Some axones—confined to the gray matter—are entirely devoid of any covering. Other axones—fibres of Remak, found mainly in the sympathetic system—are covered by a delicate sheath known as the neurilemma or sheath

of Schwann. The axones of the white matter of the brain and cord are protected by a thick sheath called the medullary sheath. The axones of the peripheral cranial and spinal nerves are covered by a medullary sheath and outside of this a neurilemma. Such axones, with their sheaths, are known as medullated nerve fibres. A medullated nerve fibre thus consists of a central core or axis cylinder which is continuous throughout the fibre and is the axone of a nerve cell. This axis cylinder is covered by a rather thick sheath of a fatty nature known as the medullary or myelin sheath, outside of which is the delicate neurilemma. From the neurilemma fine septa extend into the myelin called the incisures of Schmidt. At intervals the medullary sheath is interrupted and the axis cylinder is uncovered or covered only by the delicate neurilemma. These points are known as the

MEDULLATED NERVE FIBRES
(OSMIC ACID).

nodes of Ranvier, and the portion of the nerve fibre between two nodes as an internodal segment.

As to the physiological significance of these different parts of the neurone, our ideas are still based largely upon theoretical grounds. The cell body has been shown to be the birth or genetic centre of the neurone. From the fact that any portion of the neurone which is cut off from the cell body dies, the cell would seem to be the nutritive or trophic centre of the neurone. From the absence of nervous activity in portions of the neurone which have been cut off from their cell of origin, the cell body would also appear to be the functional centre of the neurone. The most

generally accepted theories of the significance of the component parts of the cell itself may be summed up as follows. The function of the nucleus is the same as in other cells. It seems to preside over the constructive activities of the neurone, by which food products brought to the cell by the lymph are transformed into food elements of the cell, and finally into its nervous elements proper. The basement substance and the chromophilic bodies represent the food elements of the cell. The cytotreticulum represents the working nervous mechanism of the cell, it alone being concerned in the reception, transformation, and emission of the nervous impulse. Of the processes the axone is centrifugal in function, carrying impulses away from the cell body, the dendrites are centripetal in function, bringing impulses to the cell body. Axones thus act as organs of distribution as regards the nervous impulse, dendrites as organs of reception. Neurones are associated with one another by approximation or by contact, and not by continuity of their protoplasm; that is, no two neurones are believed to be directly connected with each other. The axonal terminations of one neurone simply lie in contiguity, or at most in touch with the dendrites or cell bodies of other neurones, the impulse passing over from one to the other.

Neuroglia, or the connective tissue of the nervous system, differs both in structure and in origin from the form of connective tissue found in other organs. As already stated, it is epiblastic in origin, developing like the neurone from the cells which line the embryonic neural canal. These cells, at first morphologically identical, soon differentiate into neuroblasts, or future neurones, and spongioblasts, or future neuroglia cells.

In adult neuroglia two main types of cells are found, spider cells and mossy cells. The spider cell has a rather small body, from which are given off on all sides straight, unbranching, spine-like processes. They occur mainly in the white

CELLS FROM SECTIONS OF THE BRAIN OF ADULT MAN.
a, Mossy cell; b, spider cell.

matter. The mossy cell has also a rather small body, its processes are fewer, are coarse, rough, and branching; they occur mainly in connection with blood-vessels. As in the case of the nerve cell, the processes of these cells do not anastomose, but interlace, forming a dense feltwork.

The nervous system is composed in all vertebrate animals of two distinct portions or systems—viz. the *cerebro-spinal* and *sympathetic* or *ganglionic*.

The *cerebro-spinal system* includes the brain and spinal cord (which form the *cerebro-spinal axis*, or central nervous system) and the cranial and spinal nerves. It was termed by Bichat the nervous system of animal life, and comprises all

the nervous organs concerned in sensation, volition, and mental action.

The *sympathetic system* consists essentially of a chain of ganglia connected by nervous cords, which extends from the cranium to the pelvis, along each side of the vertebral column, and from which nerves with large ganglionic masses proceed to the viscera and blood-vessels in the cavities of the chest, abdomen, and pelvis. It was termed by Bichat the nervous system of organic life, since it seems to regulate—almost or quite independently of the will—the due performance of the functions of the organs of respiration, circulation, and digestion.

THE CENTRAL NERVOUS SYSTEM. The brain and spinal cord are covered and protected by three membranes or *meninges*, as they are frequently

VIEW OF THE CEREBRO-SPINAL AXIS.

The right half of the cranium and trunk of the body have been removed by a vertical section; the membranes of the right side of the brain and spinal cord have been cleared away, and the roots and first part of the fifth and twelfth cranial nerves, and of all of the spinal nerves of the right side, have been dissected out and laid separately on the wall of the skull and on the several vertebrae opposite to the place of their natural exit from the cranio-spinal cavity.

Front. lo., frontal lobe; Temp. lo., temporal lobe; Occip. lo., occipital lobe; Cereb., cerebellum; Po. Var., pons Varolii; Med. obl., medulla oblongata; a and b, upper and lower extremities of the spinal cord; Cau. eq. on the last lumbar vertebral spine marks the cauda equina; Ner. trig., the three principal branches of the nervous trigeminus; C. 1st., the sub-occipital or first cervical nerve; C. 8th., the eighth or lowest cervical nerve; D. 1st., the first dorsal nerve; D. 12th., the last dorsal nerve; L. 1st., the first lumbar nerve; L. 5th., the last lumbar nerve; S. 1st., the first sacral nerve; S. 5th., the fifth sacral nerve; L. sac. plex., the left sacral plexus; Coc. ne., the coccygeal nerve.

termed—viz. the *dura mater*, the *arachnoid*, and the *pia mater*. The *dura mater* is a strong fibrous membrane, which supplies the cranial bones with blood in early life, and adheres firmly to their inner surface. The *arachnoid* (so called from its being supposed to be as thin as a spi-

der's web) is a serous membrane, and, like all serous membranes, is a closed sac, consisting of a parietal and a visceral layer. The parietal layer adheres to the inner surface of the *dura mater*, while the visceral layer somewhat loosely invests the brain and spinal cord, from direct contact with which, however, it is separated by the intervention of the *pia mater* and some loose areolar tissue. The *pia mater* is an extremely vascular membrane consisting of minute blood-vessels, held together by an extremely fine areolar tissue. It dips down between the convolutions and fissures of the brain, and is prolonged into the interior, forming the *velum interpositum* and the choroid plexuses of the fourth ventricle. It is by means of this membrane that the blood-vessels are conveyed into the nervous substance.

THE CEREBRO-SPINAL NERVOUS SYSTEM. In describing this it is more convenient to begin with a description of the spinal cord, the study of which is essential to a proper appreciation of the higher and more complicated centres.

The *Spinal Cord* is that portion of the cerebro-spinal axis which is contained in the spinal canal. It extends from the upper border of the first cervical vertebra or atlas above, to the middle or lower margin of the first lumbar vertebra below. The cord is continuous superiorly with the medulla oblongata, while its lower extremity tapers off into a slender cord, the *flum terminale*. At two levels, one in the cervical and one in the lumbar region, the diameter of the cord is considerably larger than elsewhere. These are known respectively as the *cervical* and the *lumbar enlargements*. The *posterior median septum* and the *anterior median fissure* almost divide the cord longitudinally into two symmetrical halves, while the spinal nerve roots leaving the cord at quite regular intervals serve to divide it into *segments*. These segments correspond in number to the spinal nerves. There are thus eight cervical, twelve dorsal, five lumbar, five sacral, and one or two coccygeal segments. The internal structure of the cord can be best appreciated by studying a transverse section through the cervical enlargement stained by Weigert's method. Such a section shows that two substances enter into its composition, one situated centrally, the other on the periphery. On account of their appearance in fresh tissues, the former is called *gray matter*, the latter *white matter*. The gray matter is made up mainly of cells and their dendrites, and of non-medullated axones; the white matter consists mainly of medullated nerve fibres, its whiteness being due to the myelin. The gray matter presents somewhat the form of the letter H. Posteriorly, it is slender, and almost touches the surface—*posterior horns*—while anteriorly it is broad—*anterior horns*—and separated from the surface by a considerable layer of white matter. The expanded tip of the posterior horn is known as the head or *caput*, and contains a gelatinous substance, the *substantia gelatinosa* of Rolando. The narrow portion connecting the head with the central gray matter is called the neck or *cervix*. Laterally, the gray matter extends out somewhat into the white matter as the *lateral horn* or *processus reticularis lateralis*. The gray horns of the two sides of the cord are connected by a commissure containing the *central canal*. In foetal life this canal is open and continuous with the ventricles of the brain. In adults it is

usually more or less obliterated. It is surrounded by the *substantia gelatinosa centralis*, and divides the gray commissure into an *anterior gray commissure* and a *posterior gray commissure*. Passing out from the anterior horns to the surface of the cord are bundles of fibres which constitute the *anterior or motor spinal nerve roots*. Just to the median side of the posterior horns are seen the entering fibres of the *posterior or sensory nerve roots*. By the posterior horns the white matter of the cord is divided into *posterior columns* and *antero-lateral columns*, the latter being again rather indefinitely subdivided by the fibres of the anterior roots into lateral and anterior columns. The posterior columns are also usually subdivided at this level by a connective tissue septum from the pia mater into an internal portion, the *column of Goll*, and an external portion, the *column of Burdach*.

FIBRE SYSTEMS OR TRACTS OF THE CORD. As already noted, the cell bodies of the neurones are grouped in the gray matter of the brain and cord in the ganglia of the cranial and of the spinal nerves and in the end organs of certain of the nerves of special sense. This grouping is for definite physiological purposes. The axones from many of these neurone groups pass into the white matter as distinct bundles and constitute fibre systems or fibre tracts. In the normal adult cord these various tracts of fibres present the same appearance and cannot be differentiated from one another. Certain of the methods described above, however, especially the method of embryology and the method of pathology, have enabled us to determine the following systems: (1) Descending tracts: (a) The direct pyramidal-

the direct cerebellar tract; postero-lateral ascending tract or tract of Flechsig; (e) the tract of Gowers or the antero-lateral ascending tract. (3) Short systems, fundamental columns or ground bundles, composed of short ascending and descending fibres intermingled.

LOCATION OF THE FIBRE SYSTEMS OF THE CORD AND ORIGIN OF THEIR FIBRES. The location of the fibre tracts can be best understood by reference to the accompanying diagram: The *direct pyramidal tract* occupies a small oval area adjacent to the anterior fissure. It decreases in size as it passes downward and disappears entirely in the mid or lower dorsal regions. The *crossed pyramidal tract* occupies the postero-lateral region of the cord. In the cervical and dorsal regions it is

separated from the surface by the direct cerebellar tract. In the lumbar region the latter tract is no longer present and the crossed pyramidal comes to the surface. This tract extends to the lowermost part of the cord, decreasing in size as it descends. The fibres of the pyramidal tracts are axones of cells situated in the brain in the region of the fissure of Rolando or motor area. These fibres descend through the internal capsule, pons, and medulla. In the medulla they form a large bundle of fibres known as the *anterior pyramids*, lying on either side of the anterior fissure. At the junction of medulla and cord most of these fibres cross over, in what is called the *pyramidal decussation*, to the opposite postero-lateral region, to continue down the cord as the *crossed pyramidal tract*. A small number of fibres remain in the anterior region and pass down the cord as the *direct pyramidal tract*. Both tracts as they descend send collaterals and terminals into the gray matter of the anterior horns, where they end in arborizations around the motor cells there situated. These tracts thus constitute the *motor pathway* connecting the brain and cord, carrying voluntary motor impulses from the brain to the cells of the anterior horns, which latter directly control muscular movements. The *descending comma tract* is a small tract of fibres in the dorsal region situated about the middle of the column of Burdach. By some investigators it is believed to

represent descending branches from posterior root fibres, by others, descending axones of cells situated in the cord. The *descending cerebellar tract*, or tract of Loewenthal, consists, as its

to cord are not in accord. It is probable that in the case of many of the fibres two neurones are involved, the connection being made through the

olivary nucleus of the medulla. These axones end in the gray matter of the cord. The *column of Goll* and the *column of Burdach* are composed of the axones of the cells of the ganglia of the posterior roots of the spinal nerves. Entering the posterior columns, these axones divide into ascending and descending arms. The latter is short and soon ends in the gray matter. The ascending arm may be short, of medium length, or long. The short and medium length fibres end in the gray matter of the cord, after sending in collaterals at different levels. The long fibres pass up to the medulla and end, those of the column of Goll in the nucleus gracilis, those of the column of Burdach in the nucleus cuneatus. The *column of Lissauer* consists of the shortest fibres which enter the posterior roots. These fibres end in the posterior horns. These neurones, whose central axones form the entering fibres of the posterior roots of the spinal nerves taken in connection with the analogous sensory roots of the cranial nerves, constitute the *peripheral sensory neurone system*. It is by means of these neurones that all impulses are conveyed from the periphery or surface of the body to the cord and brain. By their influence over the motor cells of the cord they determine the *direct reflex actions*. By their in-

LARGE GANGLION CELL OF THE VENTRAL HORN OF THE SPINAL CORD.

fluence over other cells situated in the cord, medulla, and mid-brain, sensory impressions are transmitted through other systems of neurones to the brain, and thus enter into consciousness. By their influence upon motor cells of the cortex they complete the cycle of a sensory impression entering consciousness and being transformed into a voluntary motion. The *direct cerebellar tract* or *dorso-lateral ascending tract* lies near the lateral surface of the cord from the posterior horn to about the mid-lateral point. It begins in the upper lumbar region and extends to the cerebellum. Its fibres are axones of the cells of Clark's column or the nucleus dorsalis of the same side. This nucleus is a group of cells lying in the gray matter just to the median side of the base of the posterior horn. It extends as a continuous column from the mid-lumbar to the lower cervical region. In the medulla the direct cerebellar tract enters the restiform body and thus reaches the cerebellum by means of the inferior cerebellar peduncle. *Gowers's tract*, or the *ventro-lateral ascending tract*, lies along the periphery of the cord from the anterior limit of the direct cerebellar to the anterior nerve roots. The tract first appears in the upper lumbar cord and increases in size as it passes upward. Its fibres are axones of cells scattered through the gray matter

of the same and opposite sides of the cord. Many of the fibres of this tract are probably spinal association fibres and reënter the gray matter to terminate there. Other fibres, however, pass upward to higher centres, their exact terminations being as yet undetermined. The remainder of the white matter of the cord is constituted by the short fibre systems (fundamental columns or ground bundles). It will be seen that in the main these short fibres lie adjacent to the gray matter and are more extensive in the anterior part of the cord. They are axones of cells situated in the gray matter of the cord. These axones enter the white matter, pass up or down, or, splitting, send one branch up, the other down, and finally terminate in the gray matter. Along their course they send collaterals into the gray matter. These fibres of the fundamental columns thus serve to connect the gray matter of different levels of the cord and may be considered of the nature of longitudinal commissural fibre systems. By means of these neurones an impulse coming into the cord by the posterior nerve root may be conveyed to many motor or sensory cells within the gray matter. In this way are accomplished the more complex reflex actions.

SCHEME OF THE STRUCTURE OF THE SPINAL CORD.

a, Fasciculus cerebro-spinalis ventralis; b, fasciculus ventralis proprius; c, fasciculus ventro-lateralis Gowers; d, fasciculus cerebello spinalis; e, fasciculus cerebro-spinalis lateralis; f, fasciculus lateralis proprius; g, funiculus dorsalis; Rad. dor., radix dorsalis; Rad. vent., radix ventralis; Gang. spin., ganglion spinale; 1, commissural cell, or heteromeric neurones; one is seen sending its axone into the gray substance of the other side, the others send their axones into the white matter of the opposite side; 2, motor cells; sides of fibrils are seen arising from their axones; 3, tauto-merie neurones, the axones going to the ventral and lateral funiculi; among these are cells in the nucleus dorsalis and some of the cells in the substantia gelatinosa of Rolando, collaterals are coming off from the axones; 4, a Golgi cell, or dendraxone; 5, cells sending their axones to the dorsal funiculi; 6, cell bodies of peripheral sensory neurones situated in the ganglion spinale; their central prolongations are shown entering the spinal cord as dorsal root fibres which bifurcating send collaterals to terminate in different parts of the substantia grisea; 7, collaterals and terminals representing fibres from the fasciculus cerebro-spinalis or pyramidal tract; 8, collaterals from the white fibres in the ventral and lateral funiculi.

NERVE CELLS OF THE CORD. In describing the origin of fibre systems of the cord, many of the cells of the cord have been necessarily referred to, e.g. those cells the axones of which form the columns of Gowers and of Flechsig, and the fundamental columns. There are also found in the gray matter cells which have short axones which never leave the gray matter, but terminate in the vicinity of their cells of origin. The most important groups of cells remaining to be de-

scribed are those of the anterior horns connected with the motor spinal nerve roots. These are large multipolar cells rich in chromatic sub-

PORTION OF A CROSS SECTION OF THE HUMAN MEDIAL NERVE.

stance. They are arranged in columns, two long columns extending the entire length of the cord for the innervation of the muscles of the trunk, while in the cervical and lumbar enlargements extra columns are added for the supply of the muscles of the extremities.

THE SPINAL NERVES. These are the peripheral nerves connected with the spinal cord. There are 31 pairs of spinal nerves, which are named from the levels of the cord from which they originate: 8 cervical, 12 dorsal, 5 lumbar, 5 sacral, and 1 coccygeal. Each spinal nerve is connected with the cord by two roots, an anterior or motor root and a posterior sensory root. The anterior root consists of axones of the motor cells of the anterior horns. These pass out in small bundles, by the ganglion of the posterior root, beyond which they join the fibres from the ganglion to form

PLAN OF CERVICAL PLEXUS.

the mixed spinal nerve. The fibres of the sensory root have been already described in connection with the posterior columns. These are the central processes of the spinal ganglion cells. The peripheral processes of these cells pass out of the outer end of the ganglion and join the motor fibres. The nerves leave the spinal canal through the intervertebral foramina, beyond which each nerve divides into two branches, a posterior and an anterior.

The posterior divisions of the spinal nerves are

smaller than the anterior and are distributed to the muscles and skin of the back.

The anterior divisions of the spinal nerves supply the anterior parts of the body and the extremities. Each anterior branch is connected by some slender filaments with the sympathetic. In the dorsal region the anterior divisions are separate and distributed quite evenly, but in the cervical, lumbar, and sacral regions they unite to form intricate plexuses.

THE CERVICAL PLEXUS. This is formed by the anterior divisions of the first four cervical nerves. The branches of distribution of this plexus may be divided into a superficial set and a deep set, the former supplying the integument and the more superficial muscles of the side and front of the neck and upper part of the throat; the latter supplying the more deeply seated muscles of the neck and sending one very important branch, the phrenic, to the diaphragm.

PLAN OF THE BRACHIAL PLEXUS.

The *brachial plexus* is formed by the anterior divisions of the last four cervical and the first dorsal nerves. These five nerves unite to form three main cords known respectively as the outer, the inner, and the posterior cords of the brachial plexus. Before uniting to form these cords, four main branches or sets of branches are given off. These are (1) a communicating branch to the phrenic; (2) muscular branches to the longus colli, scaleni, rhomboidei, and subclavius; (3) posterior thoracic nerve, to the serratus magnus; (4) the supra-scapular, sending branches to supply the supra- and infra-spinatus. From the three main cords of the plexus branches are given off to the chest, shoulders, and arms. Those to the chest are the external and internal anterior thoracic, which supply the pectoralis major and pectoris minor muscles. The branches to the shoulder are the subscapular and the circumflex, the former supplying the subscapularis, the latissimus dorsi, and the teres major; the latter supplying the deltoid and the teres minor. The circumflex nerve also supplies part of the integument of the shoulder and sends filaments to the musculospiral nerve. This nerve in the arm supplies the biceps, coraco-brachialis, and part of the brachialis anticus muscles. In the forearm it becomes cutaneous, supplying the in-

tegument on the radial side. The internal cutaneous nerve is a small nerve to the integument of the front of the arm and forearm. The lesser internal cutaneous or nerve of Wrisberg, the smallest branch of the plexus, is a branch to the integument on the inner side of the arm. The musculospiral supplies the triceps, anconeus, supinator longus, extensor carpi radialis longior, and part of the brachialis anticus. It sends a cutaneous branch to the skin of the outer part of the forearm. It then divides into radial and posterior interosseous branches, the former passing to the skin of the radial side of the hand, including thumb, index, middle and radial side of ring fingers; the latter supplying the carpal articulations and muscles of the back of the forearm. The ulnar nerve supplies the flexor carpi ulnaris and inner part of the flexor profundus digitorum. In the hand it supplies the adductor and part of the short flexor of the thumb, the interossei, the two inner lumbricales, and the muscles of the ball of the little finger. It supplies a cutaneous branch to the back of the little and ulnar side of the ring fingers, and to the front of the same fingers. It also supplies articular branches to the elbow and wrist joints. The median nerve supplies all the flexors and pronators of the forearm except those supplied by the ulnar. In the hand it supplies the two outer lumbrical muscles, part of the short flexor of the thumb, the opponens and the abductor. It also innervates the skin of the palm and of the palmar surfaces of the fingers not supplied by the ulnar.

PLAN OF LUMBAR PLEXUS.

The *lumbar plexus* lies at the back of the abdominal cavity behind the peritoneum. It is formed by the anterior divisions of the four upper lumbar nerves. Communicating branches connect the plexus with the lumbar ganglia of the sympathetic. Some muscular branches pass directly from the plexus to the quadratus lumborum and psoas muscles. Cutaneous branches are the (1) ilio-hypogastric, which sends an iliac branch to the skin of the buttock and a hypoglossal branch to the skin of the lower abdomen; (2) the ilio-inguinal, to the skin of the groin; (3) the external cutaneous, to the skin of the outer side of the thigh. Mixed branches of the plexus are (1) the genito-crural, to the skin of the groin and to the cremaster muscle; (2) the anterior crural, a large and important branch which supplies the sartorius, the pectineus, the psoas iliacus, and the extensors of the knee joint, besides giving off three cutaneous branches, the internal cutaneous to the skin of the inner aspect of the thigh, a middle cutaneous to the skin of the front of the thigh, and the long saphenous to the skin of the inner side of the knee, leg, and foot; (3) the obturator, which

supplies the obturator externus, the adductor longus gracilis, and adductor magnus. Branches of this nerve sometimes pass to the adductor brevis and pectineus. It forms the main nerve supply of the hip and knee joints and sometimes sends a cutaneous branch to the skin of the lower and inner part of the thigh. There is sometimes an accessory obturator nerve to the pectineus and hip joint. It is usually connected with the obturator.

The *lumbo-sacral cord* is formed by the union of the fifth lumbar nerve with a branch from the fourth lumbar. It gives rise to a communicating branch to the fifth lumbar ganglion of the sympathetic, and a muscular branch, the superior gluteal, to the gluteus medius and minimus and the tensor fasciæ femoris, after which the cord joins the sacral plexus.

The *sacral plexus* is formed by the union of the lumbo-sacral cord with the first, second, third, and part of the fourth sacral nerves. It is a large plexus situated in the cavity of the pelvis. Like the other plexuses, it gives rise to communicating muscular and mixed branches. The communicating branches pass to the upper sacral sympathetic ganglia. The muscular branches supply the quadratus femoris, the obturator internus, the gemelli, the pyriformis, and a part of the gluteus maximus. The mixed nerves are: (1) The small sciatic, which supplies part of the gluteus maximus and the skin of the back part of the thigh, buttock, popliteal space, and part of the leg. By means of the long pudendal branch it also supplies the skin of the perineum. (2) The pudic supplies the muscles and skin of the external generative organs. (3) The great sciatic. This nerve is the largest nerve of the body. It passes down the back of the thigh, giving off branches to the adductor magnus and the hamstring muscles. Above the popliteal space the nerve divides into the internal and the external popliteal branches. The internal popliteal sends a branch to the knee joint, supplies the popliteus muscle, and the muscles of the calf of the leg. It furnishes a branch called the communicans tibialis, which joins the communicans peronei to form the external saphenous nerve, which supplies the outer side of the foot. Below, the internal popliteal is continued into the posterior tibial, which supplies the long flexor of the toes, the tibialis posticus, and the skin of the heel. In the foot it divides into the internal and the external plantar nerves. The former supplies the skin of the sole of the foot, and the great, second, third, and inner side of the fourth toes, the flexor brevis pollicis, the flexor brevis digitorum, the abductor pollicis, and the two inner lumbrical muscles; the latter supplies the skin of the little and outer side of the fourth toes, and the muscles of the sole of the foot not supplied by the internal plantar. The external popliteal sends branches to the knee joint, gives off the communicans peronei to the skin of the outer side of the back of the leg, supplies the peronei longus and brevis, and divides into the external cutaneous and anterior tibial nerves. The former supplies the skin of the upper surface of the foot and of all the toes except the outer side of the little toe and adjacent sides of the great and second toes. The anterior tibial supplies the extensors of the toes, the tibialis anticus, and peroneus tertius, and ends as a cutane-

ous branch to the skin of the adjacent sides of the great and second toes.

The *sacro-coccygeal plexus* is a small plexus formed by the fourth and fifth sacral and the coccygeal nerves. It sends communicating branches to the sacral and coccygeal ganglia of the sympathetic, cutaneous branches to the skin of the arms and coccygeal region, muscular branches to the external anal sphincter, the levator ani, and coccygeal muscles, and branches to the pelvic plexus of the sympathetic, whence they supply the rectum and bladder.

PERIPHERAL TERMINATIONS OF SPINAL NERVES. The modes of terminations of these processes are extremely varied and complicated. The terminations are always 'free' in the sense that while possibly sometimes penetrating cells, they are never directly continuous with their protoplasm. The motor nerve fibres end in voluntary and involuntary muscle. On its way to a muscle a motor fibre, which, as noted above, is the axone of an anterior horn cell, may divide into several branches, a single cell thus innervating more than one muscle fibre. On reaching a voluntary muscle the bundle of nerve fibres breaks up to

THE SACRAL PLEXUS OF THE RIGHT SIDE FROM BEHIND.

L. sac. c., lumbo-sacral cord; *Sup. glut.*, superior gluteal; *Inf. glut.*, inferior gluteal; *Per.*, peroneal; *Sm. scia.*, small sciatic; *Popl.*, popliteal; *Pyr.*, nerves to pyriformis; *Per. cut.*, perforating cutaneous; *Obt. int.*, obturator internus; *Qu. fem.*, quadratus femoris; *Pa.*, pudic.

form a plexus in the connective tissue which surrounds the bundles of muscle fibres. From this plexus nerve fibres pass to the individual muscle fibres. Having arrived at the muscle fibre in which it terminates, the nerve fibre loses its medullary sheath, and its neurilemma fuses with the sarcolemma. The naked axone then (according to most observers) penetrates the sarcolemma and terminates in a more or less elaborate expansion known as a 'motor end plate.'

The sensory or afferent part of the spinal nerves is made by the peripheral processes of the spinal ganglion cells. In the skin, and in those mucous membranes which are covered with squamous epithelium, the nerve fibres lose their medullary sheaths in the subepithelial tissue, and, penetrating the epithelial layer, split up into minute fibrils which pass in between the cells and terminate there, often in little knob-like swellings. In addition to such comparatively simple nerve endings, there are also found in the skin and mucous membranes, especially where sensation is most acute, much more elaborate

terminations. Among these may be mentioned Merkel's *tastzellen*, or touch cells, the tactile corpuscles of Meissner, and the Pacinian bodies. In tendons and in muscle, sensory nerve fibres, after losing their medullary sheaths, divide into minute fibrils which are often studded with irregular expansions. In gland tissue, nerve fibres usually end as fine fibrils, which pass to the epithelial cells.

PHYSIOLOGY OF THE SPINAL CORD AND SPINAL NERVES. The sensory nerve endings serve as the receptive apparatus by means of which external stimuli may induce a nervous impulse. The motor nerve endings serve as organs of distribution through which an impulse may so affect a muscle as to cause a contraction and consequent muscular action. The nerves themselves apparently serve merely as a conductive apparatus for transmitting the sensory impulses from the periphery to the spinal cord and the motor impulses from the cord to the muscles. The spinal cord must be considered as subserving several quite different though related physiological purposes, of which the following are the most important:

(1) Its gray matter acts as a reflex centre, i.e. a centre in which an impulse brought to it by the fibres of the posterior nerve root (usually a sensory impulse) can determine an impulse passing out in the fibres of an anterior nerve root (usually a motor impulse). In this way a motion is produced by an external stimulus without any involvement of consciousness. A simple reflex is one in which the impulse passes directly from the posterior root fibres to the cells of the anterior horns. A compound reflex is one in which the impulse passes through another neurone situated within the cord in passing from the posterior root fibre to the anterior horn cell. (2) An automatic centre. By an automatic action is meant one which *apparently* occurs without any determining external stimulus, e.g. the rhythmic action of the heart or the contraction and expansion of the arteries. (3) A relay station in the transmission of impulses from and to the higher centres. This takes place through the fibre tracts of the cord and has been already referred to in connection with the description of those tracts. (4) A conduction path. This also has been noted in connection with the description of the fibre tracts of the cord.

THE BRAIN.

By this term is usually meant all that portion of the cerebro-spinal axis contained in the cranial cavity.

The human brain is larger and heavier relatively to the size and weight of the body than the brain of any other animal, with the possible exception of some of the smallest birds and mammals. It is larger and heavier absolutely than that of any other animal except the elephant and larger whales. It is largest in the white races, smallest in some of the Central African savages. It is larger in the male than in the female. The average weight of the adult male brain of the white races of Europe and America has been estimated at from 49 to 50 ounces, of the female at from 43 to 45 ounces. The brain is much larger relatively to the size of the body in the infant than in the adult, the brain of the new-born child weighing on an average from 10 to 12 ounces. The brain increases in weight up to middle life. After sixty

it usually decreases somewhat in weight. It is a common idea that large brains are apt to be associated with unusual intellectual development. Such is not, however, the case. While the brains of some men of great intellectual attainments have proved to be above the average in weight—Cuvier, 64 ounces; Abercrombie, 63 ounces; Goodsir, 57 ounces—the brains of other men apparently equally intellectual have not been above the average in weight, and Thurman reports a case of a male epileptic whose brain weighed 62 ounces, and Bicknill one from a similar case which weighed 64½ ounces. Brains weighing over 60 ounces have also been observed in the insane.

The brain may be subdivided into the medulla oblongata, the pons Varolii, the mid-brain, the cerebellum, the basal ganglia, and the cerebral hemispheres.

The medulla oblongata is the continuation upward of the spinal cord and extends from the lower limit of the pyramidal decussation below, to the lower margin of the pons above. The length of the medulla is about an inch, and its diameters, which at its lower portion correspond to those of the cord, increase from below upward. Externally the medulla shows the continuation upward of the anterior and of the posterior fissures of the cord. These fissures become more shallow as they ascend, the posterior fissure disappearing at about the middle of the medulla, where the central canal opens into the fourth ventricle. On either side of the anterior fissure is a prominence caused by the anterior pyramid, and to the outer side of the pyramid the bulging of the olivary body may be seen. The antero-lateral surface of the medulla is also marked by the exit of the sixth to the twelfth (inclusive) cranial nerves. The posterior surface shows two prominences on either side, one next the posterior fissure known as the clava, caused by the nucleus gracilis or nucleus of the column of Goll; the other just to the outer side of the clava, due to the nucleus cuneatus or nucleus of the column of Burdach. The internal structure of the medulla shows considerable resemblance to that of the cord. This is especially true of the lower part of the medulla, the structures of which are directly continuous with those of the cord. The fibre tracts of the cord, however, assume, in the medulla, new directions, and in doing so break up the formation of the gray matter. This, together with the appearance of some new masses of gray matter and some new fibre bundles, is the main factor in determining the difference in structure between cord and medulla. The internal structure of the medulla can be best understood by tracing into it the structures of the spinal cord. At the junction of medulla and

medulla, where the central canal opens into the fourth ventricle. On either side of the anterior fissure is a prominence caused by the anterior pyramid, and to the outer side of the pyramid the bulging of the olivary body may be seen. The antero-lateral surface of the medulla is also marked by the exit of the sixth to the twelfth (inclusive) cranial nerves. The posterior surface shows two prominences on either side, one next the posterior fissure known as the clava, caused by the nucleus gracilis or nucleus of the column of Goll; the other just to the outer side of the clava, due to the nucleus cuneatus or nucleus of the column of Burdach. The internal structure of the medulla shows considerable resemblance to that of the cord. This is especially true of the lower part of the medulla, the structures of which are directly continuous with those of the cord. The fibre tracts of the cord, however, assume, in the medulla, new directions, and in doing so break up the formation of the gray matter. This, together with the appearance of some new masses of gray matter and some new fibre bundles, is the main factor in determining the difference in structure between cord and medulla. The internal structure of the medulla can be best understood by tracing into it the structures of the spinal cord. At the junction of medulla and

cord occurs the pyramidal decussation. Above this decussation the fibres of the main cortico-spinal motor tracts lie in two large bundles, one on either side of the anterior median fissure, and known as the anterior pyramids. In the decussation of the pyramids the majority of these fibres cross over to the opposite postero-lateral region and pass down into the cord as the crossed pyramidal tract, the few fibres remaining next

the anterior fissure forming the direct pyramidal tract. The crossing fibres of the decussation separate off the anterior horns from the rest of the gray matter, while the intermingling of white matter and gray matter is known as the formatio reticularis. Shortly above the pyramidal decussation masses of gray matter begin to appear in the posterior columns. These are known respectively as the nucleus gracilis or nucleus of the column of Goll and the nucleus cuneatus or nucleus of the column of Burdach. In these nuclei terminate most or all of the fibres of the columns of Goll and of Burdach. The nuclei increase in size *pari passu* with the decrease in the size of the columns, the latter finally entirely disappearing. These nuclei are therefore nuclei of termination for the fibres of these columns and are of the nature of a relay station in the main spino-cortical sensory conduction path. From cells in these nuclei, axones pass around the central canal—internal arcuate fibres—decussate in the median line—sensory decussation—and then turn upward as the fillet or lemniscus. This is the main continuation brainward of the great sensory tract. Some axones from cells in the nuclei do not turn upward in the fillet, but, skirting the ventral surface of the pyramids, as the external arcuate fibres, pass to the cerebellum in the restiform body. Of the lateral tracts of the cord, the direct cerebellar tract joins the restiform body and thus reaches the cerebellum through its inferior peduncle, while the tract of Gowers continues upward in the lateral region of the medulla, its exact terminations being as yet undetermined. The posterior horns become, in the medulla, separated from the rest of the gray matter, and, becoming broken up, serve as nuclei

of termination for the sensory divisions of some of the cranial nerves. As it passes up through the medulla, the central canal, surrounded by an increased amount of gelatinous substance, gradually approaches the posterior surface, to open at about the middle of the medulla into the fourth ventricle. Of the new masses of gray matter which appear in the medulla, the largest are the olivary nuclei. These are irregular convoluted masses of gray matter situated in the ventral part of the medulla behind and to the outer side of the pyramids. They extend from the upper limit of the sensory decussation to the pons. Each olivary nucleus has a central core of white fibres which cross the median line and pass to the opposite restiform body forming the cerebello-olivary tract. To the inner side of the lower part of the olivary nucleus is a smaller mass of gray matter known as the accessory olivary nucleus, while above the main mass of the olive is the superior olivary nucleus. The distinct line of decussating fibres which extends through the centre of medulla and pons is called the median raphe. The nuclei of certain of the cranial nerves form masses of gray matter in the medulla. These, together with the root fibres of the nerves, will be found described below in connection with the cranial nerves.

The pons Varolii, or bridge, lies just above the medulla. Superficially its ventral surface is seen to be composed of fibres which pass transversely, forming a sort of bridge between the two cerebellar hemispheres. Internally the pons is composed of tracts of fibres (white matter) and of nuclei (masses of gray matter). The fibre tracts pass both longitudinally and transversely. The longitudinal fibres are mainly the continuation upward of tracts already mentioned in the description of the medulla, the pyramidal tract or main motor tract, and the fillet or main sensory tract. Some of the longitudinal fibres are, however, fibres connecting the nuclei pontis with higher centres and commissural fibres between the nuclei pontis. The transverse fibres of the pons are mostly fibres connecting the cerebellum with the nuclei pontis, and are consequently often called the middle cerebellar peduncles. They are composed of two sets of fibres, which from their location are known respectively as the superficial transverse pontile fibres and the deep transverse pontile fibres. In the median line the fibres decussate, forming a median raphe continuous with that of the medulla. Fibres of the roots of the fifth and some of the higher fibres of the roots of the sixth and seventh nerves pass from their nuclei of origin to the ventro-lateral surface of the pons. The gray matter of the pons consists of the nuclei of the nerves just mentioned and of nuclei scattered throughout the pons, which are known as the nuclei pontis and are connected with the middle cerebellar peduncles and with the cerebrum. Near the posterior surface of the pons is the fourth ventricle, which becomes narrow in the upper part of the pons as it approaches the aqueduct of Sylvius. In the floor of the ventricle is a group of nerve cells which are so deeply pigmented as to present a dark appearance to the naked eye. This dark area is called the locus cæruleus.

Above the pons is the mid-brain. Here the long fibre tracts are collected into two main bundles known as the cerebral peduncles or *crura cerebri*. Each peduncle, or *crus*, consists of a ventral por-

tion or crusta, a dorsal portion or tegmentum, and, between these, a mass of gray matter, the substantia nigra. The dorsal part of the cerebral peduncle, or tegmentum, represents the continuation brainward of the main sensory tract to the cortex cerebri. Of the ventral part of the peduncles, or crusta, about the middle three-fifths are taken up by the fibres of the pyramidal system (including fibres to the motor nuclei of the cranial nerves). Medial to these fibres in the peduncle are the fibres which pass from the frontal lobe to the nuclei pontis, while external to the pyramidal fibres are the fibres connecting the temporal lobe with the nuclei pontis. As the peduncles approach the basal ganglia the substantia nigra disappears and the tegmentum lies just dorsal to the crusta. These bundles of fibres pass through the basal ganglia between the nucleus caudatus and the optic thalamus on the mesial side and the nucleus lenticularis on the lateral side. Here they form the internal capsule, which is directly continuous above with the corona radiata, through which the fibres enter the cortex cerebri. A bend divides the capsule into an anterior portion and a posterior portion. The anterior portion lies between the caudate nucleus internally and the lenticular nucleus externally. This part of the capsule consists mainly of fibres which connect the cortex cerebri and the optic thalamus. The posterior portion of the internal capsule lies between the lenticular nucleus on its outer side and the optic thalamus on its inner side. About the anterior two-thirds of this portion is occupied by the fibres of the pyramidal tracts (including descending fibres to the motor cranial nerve nuclei). The corticopontal fibres connecting the cortex cerebri with the nuclei pontis pass through the internal capsule in two separate bundles; one bundle, coming from the frontal lobe, passes down in front of the main motor tract; the other bundle, coming from the temporal lobe, passes through the posterior portion of the internal capsule just behind the pyramidal tract. Through the posterior part of the internal capsule also passes the continuation upward of the tegmentum or main sensory tract to the cortex. On the posterior surface of the mid-brain are the corpora quadrigemina or optic lobes. These are four in number, two anterior and two posterior. Their structure is complex. The anterior pair seems to be connected in some way with vision. In the mid-brain the fourth ventricle becomes narrowed and is known as the iter or aqueduct of Sylvius.

The *cerebellum*—or little brain—is that part of the brain which lies in the inferior, occipital fossa. It is situated beneath the occipital lobes of the cerebrum, from which it is separated by the tentorium cerebelli. The average weight of the cerebellum is about $5\frac{1}{2}$ ounces. Its size relative to that of the cerebrum is about 1 to 8. In the infant the cerebellum is relatively much smaller than in the adult, its weight being about $\frac{1}{10}$ that of the cerebrum. The cerebellum measures from $3\frac{1}{2}$ to 4 inches in transverse diameter and about 2 inches from before backward at its centre. It consists of two hemispheres or lateral lobes and a smaller central lobe called the vermiciform process. The cerebellum is connected with other parts of the nervous system by means of bundles of fibres known as peduncles. Two of these, one on either side, the superior peduncles, connect it with the cerebrum. Two others, the in-

ferior peduncles or restiform bodies, connect the cerebellum with the spinal cord. The third set of peduncles, the middle peduncles, connect it with the pons. The hemispheres of the cerebellum are separated in front by a fossa which encircles the corpora quadrigemina. Posteriorly

VERTICAL SECTION OF THE CEREBELLUM.

Arb. vit., arbor vitae; Oliv. bdy., olivary body; Corp. dent., corpus dentatum.

the furrow is deeper and narrower. On the superior surface of the cerebellum, between the anterior and posterior furrows, the central lobe has a very slight elevation and is called the superior vermiciform process. On the inferior surface of the cerebellum the central lobe, called the inferior vermiciform process, lies at the bottom of the furrow, where it forms a distinct projection and is subdivided into an anterior portion, the nodule, a middle portion, the uvula, and a posterior portion, the pyramid. Two small lobes stand out distinctly from the main bulk of the hemisphere, one, the flocculus, lying to the outer side of the nodule, the other, the tonsil, lying to the outer side of the uvula. Each hemisphere is divided transversely by a deep fissure called the great horizontal fissure, which separates it

SCHEME OF THE CEREBELLAR CORTEX.

into an upper or tentorial surface and a lower or occipital surface. In addition to the flocculus and tonsil, the surface of the cerebellum is divided into several less distinct lobes. On the upper surface are the anterior or square lobe and the posterior or semi-lunar lobe. On the under surface may be seen from before backward the digastric lobe, the slender lobe, and the inferior posterior lobe. Besides the deeper furrows sepa-

rating the lobes, the entire surface of the cerebellum is crossed by a multitude of transverse grooves which divide it into plates or lamellæ and give it a foliated or laminated appearance. On cutting into the cerebellum it is seen to consist of a central portion or core of white matter which extends outward into the cortex as a series of transversely disposed branching plates. These, covered over by a layer of gray matter, form the lamina already referred to, which on cross-section present the characteristic leaf-like appearance known as the "arbor vitæ." The white matter of the cerebellum is composed of medullated nerve fibres which pass out in a radial manner into the gray matter of the cortex. These fibres are axones coming from cells situated in the cerebellum and passing out to terminate either in some other part of the cerebellum or in some other part of the nervous system, or coming from cells located in other parts of the nervous system to their terminations in the cerebellum. The gray matter of the cerebellum is composed of three layers, an external or molecular layer, an internal or granular layer, and, between the two, a layer composed of a single layer of large cells, the layer of Purkinje cells. The molecular layer contains multipolar cells of various sizes known as 'basket cells' from the fact that while their dendrites pass mostly toward the surface, their axones pass downward and end in a basket-like network around the Purkinje cells. The granular or nuclear layer derives its name from the fact that after the ordinary methods of staining it appears to be composed of a mass of small closely packed cells, each cell consisting of a nucleus surrounded by an extremely small amount of protoplasm. Intermingled with these cells are medullated and non-medullated fibres. By the application of the method of Golgi these cells have been divided into small granule cells (by far the more numerous) and large granule cells. In the case of the small granule cell the dendrites ramify in the granular layer, while the axone terminates freely in the molecular layer. The large granule cells, on the other hand, send their dendrites into the molecular layer, while

form a single layer along the boundary between the molecular layer and the granular layer. From the outwardly directed part of the cell a thick neck is given off, from which arise two main dendritic processes, which subdivide and give rise to an enormous number of processes which ramify and terminate in the molecular layer. From the opposite pole of the cell is given off the axone which passes through the granular layer and becomes a medullated fibre of the white matter.

Besides the gray matter of the cortex, certain independent masses of gray matter occur in the cerebellum. These are the corpus dentatum, a convoluted body of gray matter situated to the inner side of the centre of the core of white matter, and the roof-nuclei of Stilling, situated at the anterior end of the superior vermiform process and projecting forward into the roof of the ventricle.

The functions of the cerebellum have been made the subject of much discussion and investigation. It is itself insensible to irritation, and has been cut away in various animals, without eliciting signs of pain; moreover, its removal or disorganization by disease is generally unaccompanied with loss or disorder of sensibility, animals from whom it has been removed being apparently able to smell, see, hear, and feel as perfectly as before. Flourens extirpated the cerebellum in birds by successive layers. Feebleness and want of harmony of the movements resulted from the removal of the superficial layers. When he reached the middle layers, the animals became restless; their movements were violent and irregular. By the time that the organ was entirely removed, the animals had completely lost the power of flying, walking, standing, and preserving their equilibrium. When a pigeon in this state was laid upon its back, it could not recover its former position, but fluttered its wings, and saw and tried to avoid a threatened blow. Hence volition, sensation, and memory were not lost, but merely the faculty of combining the actions of the muscles. From a large series of experiments of this kind, subsequently made on all classes of animals, Flourens inferred that the cerebellum belonged neither to the sensitive nor to the intellectual apparatus; that it was not the source of voluntary movements, although belonging to the motor apparatus; that it is the organ for the coördination of the voluntary movements, or for the excitement of the combined and harmonious action of the muscles.

In spite of the above facts, the extent to which muscular coördination is dependent upon the cerebellum cannot be considered as satisfactorily determined.

The *cerebrum*—sometimes called the brain proper—constitutes in man the largest part of the cerebro-spinal axis. Lying within the cavity of the skull, its shape conforms to that of the cranial cavity. Anteriorly, superiorly, and posteriorly, a deep fissure runs lengthwise of the brain, called the great longitudinal fissure, separating the brain into two equal halves or hemispheres. At the bottom of the fissure a broad band of fibres—the corpus callosum—unites the two hemispheres. Each hemisphere presents three surfaces—an outer, which is convex and corresponds to the inner surface of the skull; an inner, which is flat, lying against the similar surface of the opposite hemisphere, from

NERVE CELL (CELL OF PURKINJE).

From a section through the human cerebellar cortex.

their axones form a rich plexus within the granular layer. The dense network of fibres found in the granular layer is derived from the cells just described, from axones and collaterals of Purkinje cells, and from fibres coming from the white matter. The cells of Purkinje

which it is separated by the falx cerebri; and an under surface, which is somewhat concave and rests upon the anterior and middle fossæ of the skull and upon the tentorium cerebelli. The surface of each hemisphere is marked by numerous elevations and depressions, the former known as convolutions or gyri, the latter as fissures and sulci. These convolutions serve to increase the actual surface of the brain without increasing the actual size of the organ, and the number and extent of the convolutions are in direct relation to the intellectual development, increasing throughout the ascent of the mammalian scale, and reaching their highest complexity in civilized man.

FISSURES. Of the five principal fissures of the brain, two have already been mentioned—the great longitudinal fissure, separating the hemispheres, and the great transverse fissure, separating the cerebrum from the cerebellum. Each hemisphere presents three fissures which separate the hemisphere into lobes. These are: (1) The fissure of Sylvius. This begins at the base of the brain (see diagram) and passes upward and backward on the external surface of the hemisphere, where it divides into a shorter ascending limb and a longer horizontal limb. It separates the frontal and parietal lobes from the temporo-sphenoidal lobe. (2) The fissure of Rolando begins a little behind the mid-point

of Rolando and the posterior extremity of the brain, sends a short branch outward, while its longer branch extends downward and forward on the inner surface of the hemisphere.

LOBES. The *frontal lobe* includes that part

CONVOLUTIONS AND FISSURES OF THE OUTER SURFACE OF THE CEREBRAL HEMISPHERE.

of the brain which lies in front of the fissure of Rolando and above the fissure of Sylvius. It presents the following convolutions: (a) The ascending frontal convolution, lying just in front of the fissure of Rolando and separated from the rest of the lobe by the vertical or precentral sulcus. This remaining portion of the frontal lobe is divided by two longitudinal sulci into (b) the superior frontal convolution, (c) the middle frontal convolution, and (d) the inferior frontal convolution. The last is sometimes known as the convolution of Broca. These convolutions also extend more or less into the under surface of the lobe, which is also marked by a groove in which lies the olfactory bulb.

UPPER SURFACE OF THE BRAIN, THE ARACHNOID HAVING BEEN REMOVED.

of the great longitudinal fissure and extends downward and forward to a point somewhat above and behind the bifurcation of the Sylvian fissure. It separates the frontal lobe from the parietal lobe. (3) The parieto-occipital fissure begins about midway between the fissure

VOL. XIV.—25.

CONVOLUTIONS AND FISSURES OF THE INNER SURFACE OF THE CEREBRAL HEMISPHERE.

The *parietal lobe* is separated from the frontal lobe by the fissure of Rolando, from the temporo-sphenoidal lobe below by the horizontal limb of the fissure of Sylvius, from the occipital lobe by the parieto-occipital fissure. It may be subdivided into four fairly well marked convolutions: (a) The ascending parietal, lying just behind the fissure of Rolando. Behind the as-

ending parietal convolution is the intra-parietal sulcus. The portion of the parietal lobe above the horizontal part of the sulcus is known as (b) the superior-parietal convolution, and is continuous with the ascending parietal. That part of the lobe below the horizontal arm of the sulcus is divided by a vertical sulcus into (c) an anterior part, the supramarginal convolution, and (d) a posterior part, the angular convolution.

The *occipital lobe* is separated from the upper part of the parietal lobe by the parieto-occipital fissure, while it is more or less continuous with the lower part of the parietal lobe and with the temporo-sphenoidal lobe by small connecting convolutions. The lobe is rather indefinitely divided by two small transverse fissures into first, second, and third occipital convolutions.

The *temporo-sphenoidal lobe* lies in the middle fossa of the skull and is bounded above and in front by the Sylvian fissure. Posteriorly, connecting convolutions unite it with the parietal and occipital lobes. It is divided by two horizontal sulci into three convolutions called from above downward, the first, second, and third temporo-sphenoidal convolutions.

The *central lobe* or *island of Reil* is situated in the depth of the fissure of Sylvius, and composed of five or six rather small convolutions.

parallel to the curve of the surface of the brain, separating the marginal or first frontal convolution from the gyrus fornicatus, which lies just over the corpus callosum. The quadrate lobule lies between the callosa-marginal sulcus and the parieto-occipital sulcus. The cuneus or occipital lobule lies between the parieto-occipital sulcus in front and above and the calcarine sulcus below. The uncinate gyrus lies below the Sylvian fissure and the dentate sulcus, while below it is separated from the temporo-sphenoidal lobe by the collateral sulcus. The temporo-sphenoidal lobe is continuous with the already described lobe of the same name in the outer surface of the cerebrum. It presents two convolutions in addition to those already described on its outer surface.

The under surface of the cerebrum shows some important features, which, passing from before backward, are as follows: (1) the longitudinal fissure, separating the frontal lobes. (2) The corpus callosum, appearing in the depth of the longitudinal fissure and serving as a great transverse commissure connecting the two hemispheres. (3) The olfactory nerve with its expanded extremity the olfactory bulb, lying in a groove in the under surface of the frontal lobe. (4) The fissure of Sylvius, separating the anterior from the middle lobe. (5) The anterior perforated space—so called from the perforations for the passage of blood-vessels—is the under surface of the corpus striatum (see below). (6) The pituitary body or hypophysis cerebri. (7) The infundibulum is a narrow tube of gray matter connecting the pituitary body with (8) the tuber cinereum, an eminence of gray matter lying between the diverging cerebral peduncles. (9) The corpora albicantia or corpora mamillaria

are two small white protuberances each about the size of a pea just behind the tuber cinereum. They are composed externally of white matter, internally of gray matter, and are formed by the anterior crura of the fornix. (10) The posterior perforated space lies between the corpora albicantia and the anterior fibres of the pons. Its perforations are due to vessels which pass to the optic thalami. (11) The optic commissure is the crossing of the right and the left optic tracts to form the optic nerves. It is situated just in front of the tuber cinereum. (See also below—optic nerve, under *Cranial Nerves*.) (12) The cerebral peduncles or crura cerebri are two diverging bundles of white fibres which appear to come out from behind the anterior border of the pons. Each peduncle passes upward, forward, and outward, and enters the under surface of the hemisphere. (For description of cerebral peduncles, see above under *Mid-Brain*.) (13) The under surface of the cerebrum also shows the exit of the third and fourth cranial nerves, the former coming out from the inner margins of the crura in front of the pons, the latter from the outer margins in front of the pons.

VENTRICLES OF THE BRAIN. The lateral ventricles represent the expanded anterior end of the embryonic neural canal, and are the cavities of the hemispheres. They are lined by a single layer of simple cylindrical epithelium, the ependyma, derived from the epiblastic lining of the neural canal. The two ventricles are separated

from each other in the median line by a vertical septum known as the septum lucidum. The shape of the ventricles is irregular, each ventricle consisting of a main cavity or body and extending off from this three smaller cavities called cornua or horns. The anterior horn passes outward and forward into the anterior lobe. The posterior horn extends backward into the posterior lobe, while the middle horn descends into the substance of the middle lobe. The main cavity of the ventricle is roofed in by the under surface of the corpus callosum. Its floor is made by the corpus striatum and optic thalamus, although the tectal semicircularis, choroid plexus, corpus fimbriatum, and fornix are also situated in its floor. The third ventricle is a long narrow cavity lying between the optic thalami. Above it is bounded by the under surface of the velum interpositum, to which is attached the choroid plexus of this ventricle. Its floor is made by the lamina cinerea, tuber cinereum, infundibulum, corpora albicantia, and posterior perforated space. Three commissures cross the cavity of the ventricle, known respectively as the anterior, the middle, and the posterior commissures. Four openings connect the third ventricle with other cavities. In front the foramina of Monroe, one on each side, serve to connect the third ventricle with the lateral ventricles. Posteriorly, the aqueduct of Sylvius connects the third ventricle with the fourth. A fourth opening in the anterior part of the floor leads into the cavity of the infundibulum. The so-called fifth ventricle of the brain is, properly speaking, not a true ventricle, being simply a part of the great longitudinal fissure which has been cut off in the development of the brain, by the union of the two hemispheres, through the corpus callosum and the fornix. It is not lined by epithelium as are the other ventricles. The fourth ventricle is described above in connection with the medulla oblongata.

Certain structures remain to be described which have already been mentioned as lying in the floor of the lateral ventricles. The two largest of these, often called the basal ganglia, are the corpora striata and the optic thalami.

The corpora striata are two masses of mingled gray matter and white matter, the superior surfaces of which appear in front of the body of the lateral ventricles. The extra-ventricular portion is known as the lenticular nucleus. The intra-ventricular part known as the caudate nucleus is smaller than the extra-ventricular, from which it is separated by the internal capsule, a large band of fibres which represents the continuation upward of the main tracts of the cord and crura on their way to the cerebrum. A layer of white matter which covers the extra-ventricular portion of the lenticular nucleus is known as the external capsule.

The optic thalamus lies to the inner side and behind the lenticular nucleus, from which it is separated by a part of the internal capsule. Each thalamus is composed of white matter externally, of gray matter internally, and rests upon the corresponding crus cerebri. It forms a part of the lateral wall and floor of the body of the lateral ventricle. As the middle or descending horn of the ventricle descends the thalamus comes to form the roof of this portion of the ventricle. In front is a prominence known as the anterior tubercle, while its posterior part

presents two small rounded eminences, the internal and the external geniculate bodies.

The tænia semicircularis is a narrow band of white fibres which lies in the depression between the caudate nucleus and the optic thalamus. Anteriorly, it follows the descending pillar of the fornix; posteriorly, it passes into the descending horn of the ventricle, and at the bottom of the horn enters a mass of gray matter known as the nucleus amygdalæ.

The velum interpositum is a vascular extension of the pia mater into the interior of the brain through the great transverse fissure. It enters the third ventricle beneath the corpus callosum and above the optic thalami, corpora quadrigemina.

DIAGRAM OF THE CELLS OF THE CEREBRAL CORTIX.

D. Deep layer; (11) fusiform cells; (12) polygonal cells. E. The white matter containing axones from pyramidal cells: (4), (5), (6), (8), and from cells (12) of the deep layer; (13) neuroglia fibre.

mina, and pineal gland. Anteriorly, it bifurcates, a part entering each lateral ventricle through the foramen of Monroe. In the third ventricle two vascular fringes hang down from the velum. These are the choroid plexuses of the third ventricle. In the lateral ventricles similar fringes are attached to the lateral margin of the velum. These are the choroid plexuses of the lateral ventricles.

The corpus fimbriatum or tænia hippocampi is the lateral edge of the posterior pillar of the fornix. It is a narrow white band lying just behind the choroid plexus of the lateral ventricle.

The fornix is an arch-shaped band of white fibres, running longitudinally, which bifurcates both anteriorly and posteriorly, forming the anterior and the posterior pillars of the fornix. The central portion or body of the fornix is triangular in shape, its narrow anterior end being attached to the septum lucidum, its broad posterior extremity being continuous with the corpus callosum. The anterior pillars curve downward in the lateral walls of the ventricle and enter the corpora albicantia, from which they pass into the optic thalami. The posterior pillars of the fornix pass downward in the descending horns of the lateral ventricle, their thin margin forming the already described corpora fimbriata.

The hippocampus major or cornu Ammonis, so called from its fancied resemblance to a ram's horn, is a long curved body consisting of both gray matter and white matter which follows the curve of the floor of the middle horn of the lateral ventricle. It is formed by an extension inward of the dentate sulcus. The gray substance of the sulcus forms an irregular ridge along the margin of the hippocampus major, known as the fascia dentata. The lower end of the hippocampus major is marked by several rounded elevations which from their resemblance to the paw of an animal are known as the pes hippocampi. The hippocampus minor is a longitudinal eminence in the floor of the posterior horn of the lateral ventricle. It is due to the extension inward of the calcarine sulcus. The eminencia collateralis or pes accessorius is an eminence caused by the inward projection of the collateral fissure. It lies between the hippocampus major and hippocampus minor, and between the posterior and descending horns of the lateral ventricle.

GENERAL HISTOLOGY OF THE CEREBRUM. Each cerebral convolution consists of a central white core covered over by a layer of gray matter, which latter constitutes the cerebral cortex. The cerebral cortex may be divided into three fairly distinct layers: (1) an outer barren or molecular layer; (2) a middle layer, or layer of pyramidal cells; (3) an inner layer, or layer of polymorphous cells.

(1) The nerve cells of the barren or molecular layer are known as the cells of Cajal. They are fusiform, triangular, or irregular in shape, and both their dendrites and axones ramify in this outer layer, the axones passing mainly in a direction parallel to the surface. This layer also contains the terminations of the apical dendrites of the pyramidal cells, some medullated nerve fibres running parallel to the surface, called superficial tangential fibres, and a rich plexus of neuroglia.

(2) The layer of pyramidal cells is often described as two separate layers, an outer layer of small pyramidal cells, and a deeper layer of large pyramidal cells. Each pyramidal cell has passing off from its outwardly directed angle a large apical or main dendrite. Smaller dendrites pass off from the sides and base of the cell. The axone originates from the base of the cell and enters the white matter of the corona radiata. During its passage through the gray matter it sends off collateral branches. Some of these collateral branches are medullated and form the deep tangential fibres. Among the deeper cells of this layer are found some very large pyramidal cells, called the cells of

Betz. These cells are found only in the motor cortex, and it is believed that it is the axones of these cells which pass down through the internal capsule to the cord as the main motor tract. In this layer are also found cells—cells of Martinotti—the dendrites of which pass downward, while their axones pass upward to the molecular layer, where they turn

Nerve process

PYRAMIDAL CELL FROM A PERPENDICULAR SECTION OF THE CEREBRAL CORTEX OF ADULT MAN.

The terminal branches of the dendrites running toward the molecular layer are not visible.

and run parallel to the surface as the superficial tangential fibres. Cells of Golgi type II. are also found in this layer. The axones of these cells branch rapidly and end in the gray matter in the vicinity of their cells of origin. The fibres of this layer consist of the axones and dendrites of the cells above described, and of axones from cells in other regions which are passing to their terminations here.

(3) The cells of the third layer are fusiform or irregular in shape. They have no apical dendrites, their protoplasmic processes coming off irregularly and ramifying mainly in this layer. Their axones pass down into the corona radiata. The fibres of this layer consist of axones and dendrites of the cells just described, of the axones of pyramidal cells, and of axones of cells in other parts of the nervous system which are passing to their terminations here.

The corona radiata or central core of white matter radiating out into the gray matter consists of: (1) Descending fibres, which are axones of the large and small pyramidal cells and of the polygonal cells of the third layer. These axones become medullated and pass (a) to other convolutions of the same hemisphere—association fibres; (b) through the corpus callosum to the opposite hemisphere—commissural fibres; (c) to the internal capsule as fibres of the descending tracts—projection fibres. (2) Ascending fibres, which are axones of cells situated elsewhere in the nervous system, and which are here passing to their terminations. These fibres are (a) axones of cells situated in other convolutions of the same hemisphere—association fibres; (b) axones of cells situated in the opposite hemisphere, which have come through the corpus callosum—commissural fibres; (c) axones which have come through the internal capsule from cells situated in lower centres—projection fibres.

CIRCULATION. The arterial supply of the brain comes from two sources, the internal carotids and the vertebrals. At the base of the brain these four vessels form a remarkable anastomosis of large arterial trunks which is known as the circle of Willis. The arrangement of these vessels can be best appreciated by reference to the accompanying diagram. From this circle there pass off to the brain three main sets of branches: (1) The anterior cerebral, which pass forward in the great longitudinal fissure, curve around the anterior border of the corpus callosum, and, running backward on its upper surface, terminate by anastomosing with the posterior cerebral arteries. They supply the under surfaces of the anterior lobes, part

of the internal surfaces of the hemispheres, the corpus callosum, the third ventricle, and the anterior perforated space. Near their origin from the internal carotids, the two anterior cerebrals are united by a short thick trunk, the anterior communicating. (2) The middle cerebral or Sylvian arteries, which pass outward along the Sylvian fissures, within which each divides into three branches—an anterior to the anterior lobe, a posterior to the posterior lobe, and a median to the small lobe near the end of the fissure of Sylvius. (3) The posterior cerebral arteries, which, arising from the basilar, pass backward and outward on the under surfaces of the occipital lobes, each terminating in three branches, which pass respectively to the uncinate gyrus, to the temporo-sphenoidal lobe, and to the lingual lobule, cuneus, and occipital lobe.

THE ARTERIES OF THE BASE OF THE BRAIN. (The right half of the cerebellum and pons Varolii have been removed.)

All these arteries ramify in the pia, where they anastomose freely. From this anastomosis are given off small branches which enter the substance of the brain, the shorter ones breaking up into a capillary network in the gray matter, the longer ones passing to the more deeply situated white matter. After entering the brain substance, there is no further anastomosis, the arterial capillaries passing directly into venous capillaries without communicating with the capillaries of neighboring arteries.

Besides these cortical branches, branches from the circle of Willis supply the basal ganglia. Like those in the cortex, these arteries do not anastomose after entering the brain substance.

The blood supply of the spinal cord is derived from three main arteries, the anterior spinal and two posterior spinal. The anterior spinal arises from the vertebrals, and, passing downward on the anterior surface of the medulla, unite to form a single trunk, which passes down the

responding only to sensations or impressions of the moment, or varying their listlessness with restless and purposeless wanderings to and fro. While not actually deprived of intelligence, they had lost to all appearance the faculty of attentive and intelligent observation."

THE RIGHT CEREBRAL HEMISPHERE (HUMAN) SHOWING LOCALIZABLE AREAS ON THE MEDIAN SURFACES.

The separate localization of the different emotions, such as hate, love, fear, etc., which the teachings of phrenology would lead one to expect, has never been accomplished. In fact, there is every reason to believe that no such localization exists, the same parts of the cortex being concerned in very different emotions.

THE CRANIAL NERVES. The cranial or encephalic nerves arise from the under surface of the encephalon or brain and leave the cranial cavity through foramina in its floor. According to the older classification of Willis, the cranial nerves were divided into nine pairs. The later and now more generally used classification of Sommerring recognizes twelve pairs of cranial nerves. The names of these nerves, taken in order from before backward, are, according to these classifications, as follows:

	Sommerring	Willis
	<i>Pair</i>	<i>Pair</i>
Olfactory.....	First	First
Optic.....	Second	Second
Motor oculi.....	Third	Third
Pathetic.....	Fourth	Fourth
Trifacial.....	Fifth	Fifth
Abducens.....	Sixth	Sixth
Facial (Portio dura).....	Seventh	Seventh
Auditory (Portio mollis).....	Eighth	
Glosso-pharyngeal.....	Ninth	Eighth
Pneumogastric.....	Tenth	
Spinal accessory.....	Eleventh	Ninth
Hypoglossal.....	Twelfth	

From the physiological standpoint these nerves fall into three groups, according to their functions. (1) Motor nerves: (a) oculo-motor; (b) pathetic; (c) abducens; (d) facial; (e) hypoglossal. (2) Sensory nerves: (a) olfactory; (b) optic; (c) auditory. (3) Mixed nerves: (a) trifacial; (b) glosso-pharyngeal; (c) pneumogastric; (d) spinal accessory. Of these the olfactory, optic, auditory, and parts of the glosso-pharyngeal and trifacial are sometimes classified by themselves as nerves of special sense.

The cranial nerves are connected with the surface of the brain at various points. These points are known as the apparent or superficial origin of the nerves. From these points their fibres can be traced into the substance of the brain to their real or deep origins in the gray matter.

The cranial nerves, with the exception of the first (olfactory) and the second (optic), are

analogous, both embryologically and anatomically, to the spinal nerves.

The motor root fibres of the cranial nerves are the axones of neurones whose cell bodies are situated in the gray matter of the medulla and parts above (motor nuclei of the cranial nerves), just as the motor root fibres of the spinal nerves are the axones of neurones whose cell bodies are situated in the gray matter of the cord (anterior horns). These motor nuclei are the nuclei of origin for these nerves. They are nuclei of termination for neurones of higher systems which serve to bring the peripheral neurone under the control of higher centres.

The neurones which constitute the sensory portions of the cranial nerves have their cell bodies situated in ganglia outside the central nervous system. These ganglia correspond to the posterior root ganglia of the spinal nerves. The outwardly directed processes of these cells pass to their peripheral terminations, as do those of the spinal ganglia cells. The central axones of these neurones enter the medulla and form longitudinal tracts of fibres in a manner quite analogous to the formation of the posterior columns by the central axones of the spinal ganglia cells. The sensory root fibres of the cranial nerves, however, do not ascend, as do those of the spinal nerves, but turn spineward, forming descending roots. These fibres terminate in the gray matter of the medulla (terminal nuclei of the cranial nerves) in the same manner as do the spinal sensory root fibres in the gray matter of the cord and medulla.

The first, or olfactory nerve, is properly not a nerve, but a slender process of the brain which terminates in an enlargement, the olfactory bulb, from which the olfactory nerves themselves are given off. The size and development of this olfactory process and bulb vary greatly in different animals, being in man quite rudimentary as compared with animals noted for their acute sense of smell. The olfactory process is connected with the rest of the brain by three roots called respectively the internal, or short root, the middle, or gray root, and the external, or long root. The olfactory nerves proper, that is the bundles of filaments extending from the under surface of the olfactory bulb through the foramina in the cribriform plate of the ethmoid to the mucous membrane of the nose, are made up of axones of neurones whose cell bodies are located in the nasal mucous membrane. In this respect the peripheral olfactory neurones differ from all other human peripheral sensory neurones. The short, hair-like processes of these cells which pass outward toward the surface are the dendrites. The centrally directed processes are the axones. They are non-medullated, and, passing through the cribriform plate in bundles (olfactory nerves), enter the olfactory bulb, where they terminate in end-arborizations in the olfactory glomeruli. In the glomeruli they come into relation with the dendrites of the mitral cells of the olfactory lobe. The axones of these mitral cells are medullated and form the main mass of fibres which pass back to the brain through the olfactory process or tract and its roots.

The second cranial, or optic nerve, is the nerve concerned in the special sense of sight. It is distributed entirely to the eyeball. The nerves from the two eyes, passing backward and

inward, unite to form the optic commissure. From the commissure two large bundles of fibres—the optic tracts—pass backward and outward to the brain. The eye differs from all other sense organs in that its nervous apparatus is developed by a direct outgrowth from the embryonic neural canal. Later, the ingrowth of mesoblastic tissue separates the external or retinal part from the central nervous system. This retinal part is analogous to the posterior root ganglion of the spinal nerves, and, as is the case with the latter, its subsequent connection with the central nervous system is made by the growth of axones from the peripherally situated cells back into the central system. For structure of retina, see EYE.

The third, or oculo-motor nerve, is a purely motor nerve. Its fibres are the axones of a

group of cells situated just to one side of the median line in the floor of the iter beneath the corpora quadrigemina. Passing internally to the red nucleus, the nerve reaches the ventral surface of the mid-brain at the inner margin of the cerebral peduncle just in front of the pons. The nerve runs forward along the inner wall of the cavernous sinus, and, dividing into two parts, enters the orbit through the sphenoidal fissure. The superior branch of the nerve supplies the superior rectus and levator palpebræ. The inferior branch supplies the internal rectus, the inferior rectus, and the inferior oblique.

The fourth, or pathetic nerve, is the smallest cranial nerve. Like the preceding, it is a purely motor nerve. Its fibres originate in a group of cells in the floor of the iter just below the nucleus of the third nerve. The nerve winds around the outer side of the crus cerebri just in front of

the pons, and, passing along the outer wall of the cavernous sinus, enters the orbit through the sphenoidal fissure. It supplies the superior oblique muscle.

motor root come from cells situated in the medulla. The fibres of the sensory root come from cells in the Gasserian ganglion. The central processes of these cells enter the pons and pass to two nuclei in the floor of the fourth ven-

tricle. The Gasserian ganglion lies in a depression in the petrous portion of the temporal bone. From the anterior aspect of the ganglion three branches are given off—the ophthalmic, the superior maxillary, and the inferior maxillary. The ophthalmic divides into three branches, the lachrymal, frontal, and nasal, which enter the orbit through the sphenoidal fissure and supply the eyeball, lachrymal gland, mucous membrane of the eye and nose, and the skin of the eyebrow,

PLAN OF THE FIFTH CRANIAL NERVE.

forehead, and nose. Connected with the ophthalmic branch is a small ganglion called the ophthalmic or ciliary ganglion. The superior maxillary is the middle of the branches of the Gasserian ganglion. It crosses the sphenomaxillary fossa, in which it gives off three branches, the orbital, the sphenopalatine, and the posterior dental. The nerve next enters the infra-orbital canal, where it gives off the anterior dental branch. The nerve then passes to the face through the infra-orbital foramen and terminates in palpebral, nasal, and labial branches. The sphenopalatine or Meckel's ganglion is connected with this branch of the fifth nerve. It sends off four main sets of branches: ascending, to the orbit; descending, to the palate; posterior, to the pharynx; and internal, to the nose. The inferior maxillary is the largest branch of the Gasserian ganglion and receives the entire motor portion of the nerve. Just beneath the base of the skull the nerve divides into two branches, an anterior branch and a posterior branch. The anterior branch contains nearly all the motor fibres, and, splitting up into masseteric, deep temporal, buccal, and pterygoid branches, supplies the

muscles of mastication. The posterior division is mainly sensory and is distributed as three branches—the auriculo-temporal, gustatory, and inferior dental. Two small ganglia, the otic or Arnold's, and the submaxillary, are connected with this branch of the fifth nerve.

The sixth, or abducens nerve, is a small motor nerve whose fibres are axones of a group of cells situated in the floor of the fourth ventricle. The nerve reaches the under surface of the medulla just behind the pons between the pyramid and the olive. It passes through the sphenoidal fissure, enters the orbit, and is distributed entirely to the external rectus muscle.

The seventh, or facial nerve, is a motor nerve. Its nucleus of origin consists of a group of cells situated deep in the formatio reticularis of the upper part of the medulla. The nerve leaves the surface of the brain just behind the pons between the olive and the restiform body, thus lying to the outer side of the sixth nerve. The nerve passes forward and enters the internal auditory meatus with the sixth nerve. At the bottom of the meatus it passes into the Fallopian aqueduct, by means of which it traverses the petrous portion of the temporal bone, finding exit through the stylomastoid foramen. It then enters the parotid gland, and just behind the jaw divides into two main branches, the temporo-facial and cervico-facial. During its passage through the temporal bone it is connected with a small gray mass known as the geniculate ganglion. Its branches of distribution are as follows: Within the Fallopian aqueduct a tympanic branch to the stapedius muscle, and the corda tympani to the muscle of the tongue (lingualis); at its exit from the styloid foramen, the posterior auricular branch to the retrahens aurem and part of the occipito-frontalis, the stylo-hyoid to the muscle of that name, and the digastric to the digastric; on the face, the temporo-facial, dividing into temporal branches and malar branches, and the cervico-facial, distributed to the muscles of the head and face.

The eighth, or auditory nerve, is the nerve of the special sense of hearing and is distributed to the internal ear. The nerve is composed of two divisions, the cochlear division and the vestibular division. The fibres of the cochlear division are axones of bipolar cells in the ganglion of Corti. The peripheral processes of these cells end among the epithelial cells of Corti's organ within the cochlea. Their central processes enter the medulla at the junction of the medulla and pons and terminate in two nuclei known as the ventral and dorsal nuclei of the cochlear nerve. By means of neurones whose cell bodies are situated in these nuclei, auditory impressions are carried to higher centres. The neurones of the vestibular division of the nerve have their cell bodies located in Scarpa's ganglion or the ganglion vestibulare. These cells are bi-polar and their peripheral processes end among the hair cells of the crista and macula acustica. Their central processes enter the medulla and pass to two nuclei of termination in which are cells whose axones carry the impulses to higher centres. See also EAR.

The ninth, or glosso-pharyngeal nerve, leaves the upper part of the medulla in the groove between the olive and the restiform body. It consists of a sensory part and a motor part. The

nerve cells of the sensory part are situated in two small ganglia, the jugular ganglion and the petrous ganglion. The central processes of these cells enter the medulla and terminate in a nucleus in the floor of the fourth ventricle, which is common to this nerve and the tenth. The cells whose axones make up the motor root are situated in a nucleus which is called the nucleus ambiguus because of its connection with this nerve and the tenth, and which lies deep in the formatio reticularis. The two parts of the nerve unite and leave the skull through the jugular foramen. Branches of this nerve are distributed to the tympanum, to the carotid, to the muscular coat and mucous membrane of the pharynx, to the stylo-pharyngeus, to the tonsil, and to the tongue.

The tenth, vagus, or pneumogastric nerve, leaves the medulla just behind the ninth. It is composed of two portions, a sensory and a motor, which are connected with the already described nuclei common to both ninth and tenth nerves. The nerve leaves the cranial cavity through the jugular foramen. In the foramen it presents a swelling known as the ganglion jugulare or ganglion of the root, while just outside the foramen is a second ganglion, the inferior ganglion or ganglion of the trunk. It is in these two ganglia that the cell bodies of the sensory neurones of the nerve are situated. After its exit from the foramen, the nerve passes vertically down the neck within the sheath of the carotid vessels.

The eleventh nerve, or spinal accessory, is composed of two parts, a spinal part and a cerebral part, or part accessory to the vagus. The latter is the smaller, and arises from a group of cells situated in the medulla below the nucleus of the vagus. It leaves the medulla as three or four small filaments just below the exit of the vagus. It passes through the jugular foramen in a sheath common to it and the vagus. The spinal portion of the nerve originates in a long nucleus situated in the lateral region and extending from the middle of the medulla to the fifth or sixth cervical nerve. The fibres leave the cord in the mid-lateral region and pass through the jugular foramen.

The twelfth, or hypoglossal nerve, serves as the motor nerve for the tongue. Its nucleus is situated in the middle and lower part of the medulla, in the floor of the fourth ventricle, and ventral and lateral to the central canal. Fibres from this nucleus leave the medulla in bundles, from ten to fifteen in number, between the olive and the anterior pyramids. The nerve passes through the anterior condyloid foramen. The branches of distribution are the descendens noni, the thyro-hyoid muscular branches, and meningeal branches.

THE SYMPATHETIC NERVOUS SYSTEM. This is composed of (a) two series of ganglia which are connected with one another by nerve fibres and extend along either side of the vertebral column from the base of the skull to the coccyx; (b) plexuses, three in number, which lie in front of the spine in the thoracic, abdominal, and pelvic cavities; (c) smaller ganglia which are situated in or upon various viscera; (d) nerve fibres which serve to connect the ganglia with one another, with the cerebro-spinal system, and with the periphery.

The series of ganglia is known as the gangliated cord and may be subdivided into three cervical, twelve dorsal, four lumbar, and five sacral ganglia. In the neck these ganglia lie upon the transverse processes of the vertebrae, in the thorax upon the heads of the ribs, in the abdomen and pelvis, upon the bodies of the vertebrae and upon the sacrum. As the two cords pass into the pelvis they unite in a ganglion called the ganglion impar, in front of the coccyx. Superiorly, the gangliated cord is continued into the sympathetic plexus on the carotid artery, this plexus being connected by filaments with the lower cranial nerves. The ganglia are connected

THE SYMPATHETIC NERVE.

with one another by bundles composed of intermingled gray fibres and white fibres, the white fibres being derived from the spinal nerves. The branches which connect the sympathetic ganglia with the cerebro-spinal system are composed of both white fibres (medullated) and gray fibres (non-medullated). The former are derived from the cerebro-spinal axis and pass to the sympathetic, the latter originate in the sympathetic system and end in the cerebro-spinal.

The three great gangliated plexuses are known respectively as the cardiac, the solar or epigastric, and the hypogastric. They are composed of nerve fibres and ganglia, the former coming from the cerebro-spinal nerves and from the gangliated cord. The cardiac plexus consists of a superficial portion which lies in the concavity beneath the arch of the aorta, and of a deep portion situated between the aorta and trachea.

The solar plexus is the great plexus of the abdomen and supplies all the abdominal viscera. It is subdivided into several smaller plexuses, the names of which sufficiently indicate their location and distribution. They are known as the aortic plexus, the celiac plexus, the phrenic (diaphragmatic) plexus, the supra-renal plexus, the renal plexus, the spermatic plexus, and the superior mesenteric plexus. The hypogastric plexus lies on the front of the sacrum between the two common iliac arteries. Below the hypogastric plexus is continued into the pelvic plexus, which is situated at the side of the rectum and bladder in the male; of the rectum, vagina, and bladder in the female. It sends branches to all the pelvic viscera and gives rise to the following subsidiary plexuses, the inferior hemorrhoidal, the prostatic, the vesicle, and in the female the uterine and vaginal.

Smaller ganglia are situated in certain viscera, notably in the heart, stomach, intestines, and uterus. They are mostly microscopic in size.

All of these ganglia serve as true nerve centres and from them pass off branches of distribution to the involuntary muscles of the blood-vessels and of the gastro-intestinal canal, to the thoracic and abdominal viscera, to the secreting cells of the various glands, etc.

Functionally the sympathetic system is quite distinct from the cerebro-spinal system. It has been called the system of vegetative existence because of its presiding over the processes of nutrition and growth, the so-called vegetative functions, in contra-distinction to the cerebro-spinal system, which presides over such distinctly animal faculties as sensation, motion, and intellect. The sympathetic system controls the so-called automatic mechanisms of the body, the rhythmical beating of the heart, contraction and dilatation of the arteries, the peristaltic action of the gastro-intestinal tract, the contraction of smooth muscle in general wherever found, the control of secretion of various glands, etc. It has also been customary to ascribe to the sympathetic a certain 'trophic' function by which was meant the determination of the nutrition of the various tissues and organs. It seems more proper to ascribe this nutritional control to its vaso-motor function, by means of which it determines the blood supply to the various parts. The sympathetic nerves contain both afferent and efferent fibres, so that impulses are transmitted both to and from the ganglionic centres. It is doubtful how many of the afferent impulses are sensory, while certainly many of the efferent impulses are not motor. The close anatomical relation which exists between the cerebro-spinal and the sympathetic system has been mentioned, and while the latter seems to be to a certain extent independent in its action, it is not infrequently brought under the control of the former even in our conscious activities. Thus in the case of blushing, an impulse reaching the cerebro-spinal centres through the eye, ear, or other sense organs causes such a reaction on the part of the sympathetic as to bring about a dilatation of the capillaries of the face. Again, in the case of the heart, quick beating and palpitation are frequently caused by the reaction of the sympathetic to impulses which have passed in through the cerebro-spinal nerves.

NERVOUS SYSTEM, EVOLUTION OF THE.

The nervous system comprises those tissues that have the property of irritability or of sensitiveness to external influences, and whose function it is to mediate between the outer world and the inner, and to convey to the muscles and other organs motor impulses so as to bring about movements harmonious and advantageous to the organism. In the nervous system also are centred those phenomena which we designate as thought, reason, will, etc. The origin of the nervous system is apparently independent of that of the muscular system, but the development of nervous tissue accompanies that of the contractile organs. In the most primitive organisms, such as the amœba, the whole protoplasm of the animal body is sensitive to external influences; there is a diffuse irritability. Thus the whole body of the amœba moves away from strong light. Moreover, it has the ability to move with reference to objects that stimulate it in some physical or chemical way.

LOWER INVERTEBRATES. In the Metazoa the nervous system develops in the ectoderm or outer layer of the body wall, which is the region that comes in contact with the outside world and hence is the one in which we should expect sensitiveness to become first developed and localized. Some of the cœlenterates have in the ectoderm superficial sensory cells with which the nerve cells are in contact. Fibres from the nerve cells connect in turn with the fibrillar part of the muscle cells. In the flatworms the nervous system is almost completely separated from the epithelium and lies in or close under the dermal musculature, and a 'brain' is best developed in some of the Polycladida and some trematodes. The nervous system of echinoderms has a development unknown in other animals. It is composed of three independent systems: (1) the superficial oral; (2) the apical oral; (3) the deeper oral. The superficial oral consists of a ring around the œsophagus, and of radial nerves which branch out from this ring to the arms and radii. This system innervates the intestine, ambulacral feet, and integument. The nervous system of Mollusca is of a complex type of its own, but shows some affinities to that of annelids and arthropods. In its simplest form (chitons) it consists of a cerebral part, from which four pairs of commissures are sent off. Passing ventrally from it there is a ring with ganglia, and passing backward two pairs of commissures, one called 'pedal' and the other 'pallial.' All of these contain ganglion cells along their whole length, and

send off various branches and commissures. The pallial commissures are united posteriorly. In the Pelecypoda the nervous system is somewhat more complex, but it is always symmetrical, and consists of two ganglia, the cerebro-pleural, one on each side of the gullet, and united above by a commissure. Each ganglion gives off a nerve cord, which passes downward and backward to the bilobed pedal ganglion of the foot. Directly backward from the cerebral ganglia also proceed two other cords to the bilobed, fused, visceral ganglion, situated on the ventral side of the posterior adductor muscle; this ganglion sends out branches to the palps and mantle. The pedal ganglion innervates the foot, the viscera, the enteric canal, the heart, the gills, and a part of the mantle. The nervous system of gastropods varies in the different groups both in regard to the arrangement of the ganglia and the commissures. There is usually a pair of ganglia near together or some distance apart, which lie above the gullet, and give off the visceral nerve cords behind. The visceral cords pass eventually into a pair of ganglia, but only after they have passed through the pleural ganglia. Pedal and buccal ganglia with their commissures also exist.

The nervous system of annelids is well developed and has a bilateral and metameric arrangement. It consists of the bilobed cerebral ganglion or brain and of a double ventral chain of ganglia and commissures. The brain lies in the prostomium or a little farther back, as in the case of the earthworm. Branches are given off from it to the eyes, tentacles, and sensory epithelium. Two lateral commissures from it pass ventrally around the alimentary canal and unite below it into the double ventral nerve chain. One ganglion occurs in this nerve chain for each segment. In some forms the two halves of the chain are widely separated and are united by transverse commissures. The arrangement of the nervous system of arthropods is essentially like that of annelids. There is a supraoesophageal ganglion or brain that gives off commissures which pass downward and backward to unite with the first ganglion of the ventral nerve chain. Various degrees of concentration of the nervous system occur throughout the Crustacea and the insects. The higher Crustacea, as well as the insects, have a visceral nervous system. The brain of insects is relatively large and is lobed.

VERTEBRATES. The nervous system of the higher vertebrates consists of a double chain of ganglia lying in the median line on the dorsal side of the body, which consists of the spinal cord and the brain. The segmental origin of the spinal cord is shown by the regular repetition of the spinal nerves that branch out from it in pairs, one on each side. The visceral or sympathetic system of vertebrates consists of a series of ganglia on each side of the vertebral column. Fibres connect this system with the spinal and cranial nerves. Nerves from the neural axis pass to all the various sense organs, muscles, and glands. The spinal cord is made up of two kinds of nervous matter, a superficial white layer and an internal H-shaped rod of gray matter. The cord merges gradually into the brain, which has a bilateral form and consists, in its simplest form, of three parts, the fore-brain, mid-brain, and hind-brain. The two lobes of the cerebrum comprise the most anterior part of the brain. The mid-brain connects the fore and hind

brain. The hind-brain includes the bilobed cerebellum on its dorsal side and the pons Varolii and medulla oblongata on the ventral side. The brain is made up of two kinds of nervous matter, the white and the gray. Its surface is much convoluted, so as to give a greater surface for the gray matter which forms the outer coating. The cranial nerves arise from the lower surface of the brain.

The brain of the Acrania (*Amphioxus*) is the enlarged anterior end of the neural axis and in it the central canal enlarges to form the ventricle. The ventricle opens dorsally to the exterior of the brain. Anterior to the opening there is a pocket known as the olfactory lobe. The brains of cyclostomes and teleosts represent a low stage of development in that they possess an unpaired prosencephalon whose dorsal wall, the *corti cerebri*, consists of a single layer of cells covered by the pia mater. In the larva of cyclostomes (*Ammocetes*) the metencephalon is the largest part of the brain. Selachians possess a more complicated brain. They lead an active, predatory life, and correspondingly the prosencephalon is relatively large and shows a slight furrow or division into two lateral parts or lobes. A prominent pair of bulbi olfactorii pass from in front to the nose. The thalamencephalon gives rise to two small optic thalami and there are other modifications in the rest of the brain which render it a more complex organ. There is a bundle of fibres from each side of the prosencephalon that probably corresponds to the *crus cerebri* of mammals. The brains of ganoids and dipnoans resemble those of amphibians in the absence of the *lobi inferiores*. In all three the cerebral hemispheres show a marked development. The cerebellum exists only as a small fold at the anterior end of the medulla. In the *Anura* the optic lobes are well developed.

In Reptilia, as in Amphibia, the cerebellum is small. A well-developed median eye-like structure, the pineal eye, is present on the roof of the mid-brain. The prosencephalon is the largest part of the brain. It is paired, and its surface is smooth. There is a large olfactory lobe and a well-developed corpus striatum. The avian brain is characterized by a considerable cranial flexure, by large cerebral lobes, by a cerebellum. In sagittal section the latter shows the arbovitæ structure so evident in the brain of man. Externally the brain is folded transversely or convoluted. The mammalian brain exhibits in the different groups a steady growth in complexity from the reptilian to the human condition. The cranial flexure is most pronounced in the mammalian brain.

That the degree of development of the different organs within the group of mammals is dependent upon their functional activity can hardly be doubted. Thus, the 'pyramids' are the motor nerves coming from the coördinating centres of movement. These are relatively small in the dolphins, which possess no hinder extremities. The frontal lobe of the cerebrum, upon which probably many of the higher functions, such as speech, depend, are best developed in man; so, too, the olfactory lobes are reduced in man in correspondence with the rudimentary condition of their function in man. While the mid-brain is more or less exposed in some of the lower mammals (e.g. marsupials, rodents, and insectivores), the hemispheres come gradually to cover the

entire brain. The mammalian brain is characterized by the presence of large commissures, the corpus callosum and fornix, which connect the hemispheres. The pons Varolii is another large commissure and connects the two lateral lobes of the cerebellum, and a number of other bands serve as connectives. In mammals the mid-brain is relatively smaller than in other vertebrates. The brain of Tertiary mammals was relatively small. The reduction was especially evident in the hemispheres. In many points of structure their brain, too, was reptilian in character, although the possessors were related to groups as high as ungulates.

Three main and well-defined types of nervous system may be determined in the animal kingdom. There is first the radial type, such as has been described for the starfish. This consists of a ring of nervous tissue in the disk which surrounds the esophagus and sends out a branch to each arm. This is the echinoderm type. Another type is the symmetrical, bilateral type of annelids and arthropods, to which the nervous system of mollusks may also be relegated. This type consists of a brain ganglion above the esophagus, with commissures that pass around and below the digestive tract, where they unite ventrally with a chain of ganglia extending posteriorly. The pedal ganglion of mollusks represents the subesophageal ganglion. The rest of the ventral chain is absent in unsegmented mollusks. The third type of nervous system is the bilateral type of vertebrates. Here the double nerve cord, segmental in origin, as is shown by the repetition of paired spinal nerves, lies on the dorsal side of the alimentary tract. Except in *Amphioxus* the vertebrate nerve cord widens anteriorly into a large and complex ganglion mass, the brain. The sympathetic system, which appears first in leeches and arthropods, is an almost independent nervous system, for while it is in direct union with the other nervous system, it is not at all under its control.

SENSE ORGANS. As soon as sense organs appear the nervous elements of animals consist of three parts: (1) the so-called terminal, end, or sense organ; (2) the ganglia; and (3) the nerves. End organs appear first clearly defined in the *Cœlenterata*, although the pigment spots of *Euglena* are in a particularly sensitive region in that infusorian. The sense organs of the *Cœlenterates* are most developed in the medusæ and consist of the tentaculocysts with calcareous lithites, pigment spots or ocelli, and sensory pits known as olfactory pits. Pigment cells or 'eye spots' are found in many of the flatworms, some of the polyclads possessing several hundred. These eyes, in many forms, are grouped in pairs at the anterior end of the body or are scattered along the anterior margin, or even along the entire margin of the body. In many forms the eyes are simple pigment spots. In others a refractive body occurs. In triclads and polyclads the eye consists of a pigmented apparatus with retinal or light-perceiving cells within a cup-shaped organ. These cells connect with the optic nerve. Auditory organs also occur in the flatworms, each consisting of a fluid-filled sphere lying close to the brain in which is an otolith. The skin is everywhere very sensitive, due to tactile hairs, especially on the tentacles. The proboscis of certain forms contains an invagination which is capable of extrusion, and is be-

lieved to be a touching organ. The suckers of trematodes, too, are especially sensitive. There are ciliated pits in the epithelium of triclads and other forms to which an olfactory function has been ascribed.

Sense organs occur over the whole integument of mollusks. These cells, when in exposed positions, may have a tactile function. The pallial sensory organs and the osphradium, which occur near the gills, are probably olfactory organs to test the condition of the water. The optic tentacles of pulmonates and the dorsal tentacles of opisthobranchs are stated by some authorities to be olfactory organs. Ciliated ridges in the mantle furrows of certain chitons are supposed to have an olfactory function. Auditory organs are absent in the *Amphineura* alone among mollusks. The auditory organ consists of a closed, fluid-filled vesicle, or 'otocyst,' in which a varying number of otoliths are inclosed. Sensory cells occur on the wall of the otocyst, which bear sensory hairs. The otocysts of cephalopods have been shown to have a statical function also. The simplest visual organs of mollusks are optic pits. The retina lies at the base of the pit, and along this base the optic nerve spreads out. The retina consists of cells with and without pigment. External to the retina is a gelatinous cuticle or even a lens. By the approach and fusion of the edges of the pit the vesicular eye is formed. That part of the epithelium which is free from pigment constitutes the cornea. This type of eye occurs on the tentacles of gastropods. By a further development the simple cup-like eye is differentiated into the complex, highly developed organ of cephalopods. The mantle eyes of the scallop resemble vertebrate eyes in that the visual rods are turned away from the light, that is to say, they are directed toward the body.

The sense organs of echinoderms comprise the auditory organs and eyes. The auditory organs are of two types. The first type is represented in holothurians, and consists of an otocyst which is lined with ciliated epithelium, container and otolith, and filled with fluid. In echinoids is found the second type of auditory or orienting organs, which are believed to be transformed spines. Organs of this type are known as 'sphæridia,' and are developed only on the oral side; they are spherical, stalked bodies and may be inclosed in a pit of the test. The organs of special sense in the annelids are the eyes, tentacles, cirri, and otocysts. The structure of the eye, when that organ is present, is very simple. The eyes are confined to the prostomium, but there are eye-like organs on many or all the body segments or on the branchial filaments of many species. Eyes are lacking in nearly all *Oligochæta* and some of the *Polychæta*. The eye is usually a capsule with a layer of elongated cells on the side toward the brain. A thickening of the cuticle may form a lens. Otocysts with otoliths are not common. Tactile cells occur generally all over the body and especially on the prostomium.

The organs of special sense in arthropods are eyes, olfactory setæ, auditory organs, and organs of touch. The eyes are of two sorts, median eyes and a pair of faceted, compound eyes. The median or 'nauplius' eyes sometimes occur in the larvæ only, and are composed of a cuticular lens and a group of specially modified epidermal cells.

The paired, compound eyes are covered by a transparent cuticula. A single visual element of the compound eye is called an ommatidium. Each element is composed of two parts, an outer vitreous and an inner sensory group of cells. The latter is known as the rhabdome and is made up of the retinule and a refracting rod. Each ommatidium is in a state of optical isolation. Fibres pass from the optic ganglia to the retinule. The organs of touch are bristled cells on the appendages, especially on the antennæ, the palpi, and on other parts of the body. The olfactory organs of the crayfish consist of a number of delicate setæ borne on the antennules. The auditory organ is a pit upon the exterior and lined with auditory setæ. Grains of sand in the case of Crustacea often serve the function of otoliths. These must be renewed after each molt.

Amphioxus possesses an olfactory pit. It is a ciliated depression at the level of the anterior end of the brain. It is connected with the olfactory lobe of the brain. This pit may correspond with the 'pituitary body' of Urochorda and Craniata. The organ of sight is merely a pigment spot. It is median and without a lens. Cells supposed to have a sensory function occur on the roof of the oral hood and tactile cells occur on the buccal cirri.

The organs of special sense of vertebrates comprise various kinds of tactile organs, of which may be mentioned the lateral-line organs, which in structure resemble the organs of chætopods. The lateral-line organs occur in amphibians and fishes, and are supposed to perceive vibrations in the water and also to have an auditory function. End-bulb organs likewise occur here and there over the entire surface of fishes. From amphibians upward they are restricted to the mouth. Specialized tactile cells, such as the Pacinian corpuscles of the duck's beak, occur in different vertebrates.

The olfactory organ is in fishes a pair of sensory pits near the anterior end of the snout. From the Dipnoi onward these pits communicate with the mouth cavity as well as with the exterior. From the Dipnoi onward also these organs are more or less inclosed either in a cartilaginous capsule or they are included in the cranium. The internal nostrils with their glands are developed in Dipnoi and Amphibia. The nasal cavity of Lacertilia is divided into an outer and an inner part. From the crocodiles onward the nasal organs recede in correspondence with the forward extension of the facial region. Both in reptiles and birds there is only one true turbinal bone in the nasal canal. Because of the extreme facial development of the skull of mammals, the nasal cavity is proportionately larger. The turbinals consequently greatly develop here. The nasal cavity of mammals communicates with certain sinuses of the face.

The sensitive elements of the vertebrate eye develop from outgrowths, primary optic vesicles, of the brain. The pigment epithelium develops from an inpocketing of this vesicle. The lens develops from thickened epidermal cells. In cyclostomes the lens and iris are absent and the sclerotic and cornea are undifferentiated. A globular lens is present in the eyes of true fishes. Amphibian eyes are simpler than those of fishes, but a ciliary muscle is present. The sclerotic is cartilaginous with bony plates even in lizards and birds. The eye-ball of nocturnal birds is

elongated and tubular. The iris of birds may be highly colored owing to the presence both of pigment and of fat globules. The eye of mammals is more or less inclosed in the bony orbit, the sclerotic is fibrous, and the fibres of the optic nerve pass into the retinal cells. The retina is histologically a complicated structure and consists of seven layers; the light must pass through all the layers in order to reach the innermost rod and cone layer. The region of acutest vision is the fovea centralis, where only the cones persist.

As to auditory organs, it is the sacculus and cochlea in the vertebrate ear that attain a higher and higher degree of development. In fishes the cochlea is a knob-like appendage of the sacculus. In amphibians it is constricted off from the sacculus and only remains connected by a strand of cells. In mammals the cochlea becomes spirally coiled. There are three coils in man. A chain of three auditory ossicles appear in the higher vertebrates.

NESBIT, EDITH. An English poet. See BLAND, EDITH NESBIT.

NESS, LOCH. A lake in the County of Inverness, Scotland. It occupies, together with Loch Lochy and Loch Linnhe, the bottom of the great fracture which in an almost straight line severs the northwestern Highlands from the rest of Scotland, and which is known as Glen More, or Great Glen (Map: Scotland, D 2). Loch Ness is 23 miles long, from one-half to one and one-half miles broad, and connected by rivers and canals with the Firth of Lorne on the southwest and Moray Firth on the northeast. It receives the waters of several small rivers, and is surrounded by high and steep mountains which make the scenery very picturesque. Owing to its immense depth the Loch never freezes.

NESSELRODE, nēs'sel-rō'de, KARL ROBERT, Count (1780-1862). A Russian diplomat, born at Lisbon, where his father then resided as Russian Ambassador. The young man devoted himself to a diplomatic career, won the confidence of the Emperor, Alexander I., and was in the diplomatic suite of the latter during the eventful year of 1813 and the negotiations at Paris after the first defeat of Napoleon. He was one of the signers of the treaty of the quadruple alliance at Chaumont, and also of the treaty with Marshal Marmont for the surrender of Paris. He was one of the most prominent of the plenipotentiaries in the Congress of Vienna, and in 1816 became Minister of Foreign Affairs, and accompanied the Emperor Alexander to the congresses of Aix-la-Chapelle, Troppau, Laibach, and Verona, where he always advocated a policy of moderation. Under Nicholas I., Nesselrode became Vice-Chancellor (1829) and Imperial Chancellor (1844). It fell to him to direct the Russian policy in the affairs of Greece and Turkey. Nesselrode was opposed to the policy which brought on the war of 1853-56 and retired from the Foreign Office after signing the Treaty

of Paris in 1856, though he retained the dignity of Chancellor of the Empire and a seat in the Ministerial Council. He died at Saint Petersburg, March 23, 1862. His autobiography, which is not of especial value, was published in 1866.

NESSLER, nēs'lēr, JULIUS (1827—). A German agricultural chemist, born at Kehl. He established at Karlsruhe the important experimental station which afterwards passed under Government control. Among the preparations known by his name are Nessler's reagent for ammonia, a mixture of iodide potassium and iodide of mercury with free potash, and Nessler's insect powder, powdered tobacco, fusel oil, soap, and spirits of wine. He described his important studies on the culture of the vine and of tobacco, and on the tests of the purity of wine, in *Der Wein, seine Bestandteile und seine Behandlung* (2d ed. 1866); *Der Tabak, seine Bestandteile und seine Behandlung* (1867); and *Die Bereitung, Pflege und Untersuchung des Weins* (7th ed. 1897).

NESSLER, VICTOR (1841-90). A German composer, born in Baldenheim, Alsace. He received his musical education in Leipzig, where he was a student of theology, during which period he successfully conducted several singing societies. The success of his opera *Fleurette* (1864) determined his career; and after further study in Leipzig, he devoted himself entirely to composition. His works comprise half a score of operas and operettas of varying merit, the most successful of which is the universally popular *Der Trompeter von Säckingen*; also choruses, song-cycles, and part-songs. He died at Strassburg.

NESSUS (Lat., from Gk. *Nēssos*, *Nesso*). In Greek mythology, a centaur who carried travelers over the river Evenus. When Hercules came with Deianira to the river, he swam across, but allowed the centaur to carry his wife. Nessus offered violence to her and was killed by Hercules. In revenge, he told Deianira that his blood would prove an invincible love philter. Later, becoming jealous of Iole, she dipped a robe in the blood and sent it to her husband, who was so tortured by the venom from the arrows poisoned in the hydra's blood, that he sought death on the funeral pile. Sophocles deals with this myth in the *Trachiniae*.

NEST. A receptacle for eggs or young, provided by many sorts of animals. The nest reaches its greatest elaboration among birds, where in some cases, as that of the cotton-bird, hangnests, weaver-birds, etc., it becomes a fabric woven with astonishing ingenuity. The nests of certain swifts (see *SALANGANE*) are further remarkable for edible qualities. Nests and the habits, instincts, and utilities connected with them are fully discussed under *NIDIFICATION*.

NESTOR (Lat., from Gk. *Nēstōr*). In the Homeric epic, the type of the wise yet vigorous old man. He was said to be a son of Neleus and Chloris, and at the time of the Trojan War had already outlived two generations. He is the persuasive speaker, drawing on his stores of wisdom and experience for the guidance of the younger leaders. In the war which Hercules waged against Neleus, all the brothers of Nestor were killed, but he escaped through his absence in Geronia. On his return to Pylos he punished the neighboring Epeians of Elis for their raids.

He even took part in the war between the Lapithæ and Centaurs, but it is only in later writers that he appears as a participant in the Calydonian Hunt and the Argonautic expedition. His part in the *Iliad* is prominent, since the Ionian princes of Asia Minor regarded themselves as his descendants. He appears in the *Odyssey* as safely returned from Troy to Pylos, where he hospitably receives the young Telemachus. Of his death there was no tradition, but Pausanias mentions his grave at Pylos.

NESTOR (1056-1114). The first Russian chronicler. In 1083 he entered the convent at Kiev, where he died after a life of asceticism and holiness. The original of his chronicle has not come down to us, nor is there any faithful copy of it extant. One can only gather what it was from the numerous later chronicles, all based on one archetype directly ascribed to Nestor in one codex. Like the mediæval chronicles of Joannes Malalas and Georgios Hamartolos, on which it drew for much information in general history, Nestor's story begins with the distribution of mankind after the flood and then leads up to the Slavs—a branch of the Japhetic race—and their subdivisions. A note after the year 1110 shows that the subsequent narrative belongs to another person. Nestor made use of all possible sources of information, incorporating treaties with Greek emperors, didactic works written by princes for their children's instruction, lives of saints, church annals, popular legends and traditions, personal reminiscences of old people, and finally his own recollections. The rapid growth of Kiev inspired the author to a high pitch of patriotism, the narrative often attaining great poetic fervor and charm. Besides the chronicle, Nestor is reputed to have written the *Lives of Saint Boris and Glyeb* and the *Life of Saint Theodosius*. Consult: *Chronique dite de Nestor*, trans. by L. Leger (Paris, 1884); Pogodin, *Nestor*, trans. into German by F. Löwe (Saint Petersburg, 1844).

NESTORIANS. The name commonly given to one of the schismatic churches of the East, formerly large and flourishing, but now small in numbers and with little influence. The name is derived from Nestorius (q.v.). It was first applied to them by a theological opponent, Philoxenus, Monophysite Bishop of Hierapolis, about the year A.D. 500, and although the Nestorians themselves never adopted the title, preferring to be known as Chaldæan or Oriental Christians, it passed into common use and has remained their usual designation. The Nestorians claim an Apostolic origin for their Church, appealing to an ancient tradition according to which the Apostle Thaddæus is said to have carried the Gospel to King Abgar of Edessa, but this story lacks historical confirmation. There is no clear evidence of the presence of Christianity in Persia before about 200, when the Bishop of Antioch held control over that section of the Church. Under the Neo-Persian kingdom of the Sassanidæ (q.v.), in the third century, a new bishopric was established at Seleucia-Ctesiphon, on the Tigris, which in time assumed ecclesiastical leadership. But it was not until the fifth century that the Nestorians began to call the Bishop of Seleucia their 'Catholicus,' or national patriarch, and still longer before his primacy was acknowledged by the other bishops.

The chief causes which gave rise to the separate existence of the Nestorian Church, during the fifth century, were as follows: (1) the reorganization of the Church by a synod of forty bishops, held in Ctesiphon in 410, after a severe persecution; (2) the condemnation of Nestorius, in 431; (3) the expulsion of Nestorius's sympathizers from Edessa by Bishop Rabulas, after the Council of Ephesus; (4) the rise of Nisibis as a centre of Christian learning and theological influence, from 435 onward; and (5) the final closing of the school at Edessa by the Emperor Zeno, in 489, on account of its persistent Nestorian leanings. All these things operated to centralize Persian Christianity, and to separate it from organic connection with the See of Constantinople. The Nestorian leaders succeeded in winning favor with the Persian kings to such an extent as completely to control the ecclesiastical situation. They had been aided in the earlier stages of their growth by the prestige of adherents like Aphraates, in the fourth century, and Ibas, Bishop of Edessa, in the fifth; but their most important leader, in the formative period, was Barsumas, one of those whom Rabulas had driven out of Edessa in 431. Barsumas became Bishop of Nisibis, and for more than half a century (435-489) he guided the fortunes of the Persian Church, wisely administering his See, winning royal favor, and establishing schools of learning (e.g. at Seleucia) to perpetuate the movement to which he had devoted his life.

During the sixth and seventh centuries the Nestorians greatly extended their numbers and influence, reaching out by means of missions into Arabia, Armenia, India, Tartary, Ceylon, and China. An ancient monument, erected in 781 at Si-ngan-fu and discovered by Jesuit missionaries in the seventeenth century, bears testimony to the existence of Nestorian Christianity in China from the year 636, when the mission appears to have been started. In 642, as a consequence of the Arab conquest of the Sassanid kingdom, the Nestorians passed under Mohammedan rule. But the caliphs granted them a considerable degree of religious toleration, and their Catholicus was treated as if he were patriarch of all the Asiatic Christians under Moslem rule. He took up his residence in Bagdad (in 762) and there remained as long as the caliphate endured. In Arabia also the Nestorians met with favor in the eyes of their Mohammedan neighbors. This friendly treatment was possibly due in part to the example of Mohammed himself, who is said once to have come into friendly contact in Arabia with a Nestorian monk, named Sergius, from whom he may have gained some knowledge of Christianity. From a Mohammedan historian of the eleventh century we learn that the Nestorians were then noted for their intellectual acumen, in which they surpassed their orthodox contemporaries. They differed somewhat from Catholic Christians in points of ritual observance, especially those relating to the calendar, and it has been thought possible that they were influenced by the customs and usages of their Jewish neighbors in Babylonia.

Nestorian Christianity culminated in the thirteenth century, when there were twenty-five metropolitans in the hierarchy, no one of whom had fewer than six bishops under his jurisdiction. The Catholicus was almost a pope in the extent of his ecclesiastical domain. But from

this time onward their prosperity diminishes. After the fall of Bagdad before the Mongols (1258), the Catholicus was obliged frequently to change his residence, which was in itself a serious administrative disadvantage. In the fourteenth century came the Tatars, under the fierce Timur (q.v.), who made sad havoc of the Nestorians. Internal dissensions split the Church in the sixteenth century, but those who claimed to be the true Nestorians adhered to the hereditary line of Mar Shimun, the family from which the Catholicus has been chosen ever since the fifteenth century. Their patriarch always bears the name of Simeon (Shimun). Some ultimately joined the Roman Catholic Church, admitting the supremacy of the Pope, but retaining special privileges, such as clerical marriage, which was a very ancient custom among them. These constitute the so-called Uniat Chaldeans. The Nestorian hierarchy at the present time consists of only one metropolitan and about ten bishops, in addition to their Catholicus. They number perhaps as many as 50,000 souls, but precise statistics are lacking. Some estimates are much larger than this.

The Nestorians take their stand upon the first two ecumenical councils, rejecting the decisions of Ephesus, and of course taking no part in subsequent councils of the Catholic Church. They have never been persuaded to accept the orthodox view of the Papacy, or of the doctrine of transubstantiation, or of purgatory. Their hierarchical organization culminates in the patriarchate. They have sanctioned clerical marriage ever since the fifth century, although this privilege does not extend to the bishops. Syriac is their official language. Their former generous philanthropy, exemplified in the foundation of asylums, almshouses, etc., has vanished along with their general prosperity as a Church and people, and at present they are themselves the objects of charity and of missionary effort. Friendly negotiations have been carried on with them by representatives of the Church of England, partly in the hope of bringing about ecclesiastical union. Protestant missionaries have been sent to them from America, especially by the American Board (Congregational), with a view to arousing them to new evangelical effort on their own behalf. But thus far these efforts have met with little success. In 1898 the Persian branch of the Nestorian Church, estimated at about 30,000 persons, formally joined the Orthodox Church of Russia, thereby gaining the political protection of the Czar.

The Christians of Saint Thomas, dwelling on the coast of Malabar, India, are historically connected with the Nestorians.

(Edinburgh, 1883); Perkins, *A Residence of Eight Years in Persia* (Andover, 1843); Hore, *Student's History of the Greek Church* (London, 1902).

NESTORIUS (Lat., from Gk. *Nestórios*, *Nestorios*). Bishop of Constantinople, 428-431, and author of the Christological heresy known as Nestorianism. He was a pupil of Theodore of Mopuestia, one of the leading theological teachers of Antioch, who was greatly revered throughout the Asiatic section of the Eastern Church.

In 428 Nestorius was summoned from his monastic retirement near Antioch to become Bishop of Constantinople, whither his fame as an ascetic and preacher had preceded him. As patriarch, Nestorius immediately declared war upon all heretics, and began persecutions against Arians, Quartodecimanians, Macedonians, etc. The popular theology of Constantinople did not escape. A presbyter named Anastasius, preaching in the cathedral church one day, declared with energy, "Let no man call Mary 'Mother of God,' for Mary was only a woman, and it is impossible that God should be born of a woman." Nestorius hastened to support and reiterate the position his presbyter had taken, which was an open defiance of the Alexandrian party.

A fierce controversy ensued. Cyril, supported by Cœlestine, Bishop of Rome, published twelve anathemas against Nestorius, to which Nestorius replied in kind. The Emperor, Theodosius II., was obliged to convene a general council to settle the disturbance. It met at Ephesus in 431. (See *EPHESUS, COUNCILS OF*.) Its stormy proceedings were directed by Cyril, and Nestorius was condemned. John of Antioch, who arrived late, entered an unavailing protest against this verdict. The writings of Nestorius were burned, by Imperial order, and his followers were branded with the opprobrious name of Simonians. Nestorius was allowed to return to his old monastery near Antioch, where he passed four years. He was then banished to Arabia, and afterwards to Egypt, where he endured many hardships, and won the title of martyr among his followers. He wrote a defense of his life and teaching, of which only a few fragments survive (in the works of his opponents). We have a melancholy picture of the closing years of his life in Evagrius's *Ecclesiastical History*, i. 7, which is evidently colored by the author's hostility. The place and date of his death are unknown. The Nestorians (q.v.), although bearing his name, do not cherish his peculiar teaching. An illustration of Monophysite detestation of his memory is found in the grim ceremony of the Jacobites, who once a year assemble and cast stones upon the spot where his body is supposed to have been buried. Consult: Smith and Wace, *Dictionary of Christian Biography*, article "Nestorius;" Harnack, *History of Dogma*, vol. iv. (Eng. trans., London, 1898); Schaff, *History of the Christian Church*, vol. iii. (3d ed., New York, 1889); Du Bose, *The Ecumenical Councils*, chs. 10 and 11 (2d ed., ib., 1897); Bright, *The Age of the Fathers* (London, 1903).

NETHERLANDS, THE; often called **HOLLAND**. The country forming, with the coastal region of Belgium, the lowest part of Europe. It is the western continuation of the low plain of North Germany and lies between latitudes 50° 45' and 53° 30' N., and longitudes 3° 22' and 7° 12' E. It is bounded on the west and north by the North Sea, on the east by Prussia, and on the south by Belgium. With an area of only 12,648 square miles, it is one of the smallest independent States of Europe. Its topography has had a leading part in shaping its history. The country is emphatically a maritime State. Half of its boundaries (465 miles) are formed by the sea, and no place in the kingdom is more than 120 miles from it.

TOPOGRAPHY. The northern part of the Netherlands is indented by the Zuyder Zee, which repre-

sents in part an ancient lake, the sea having broken through the intervening land in the thirteenth century. There are many considerable islands along the coast, distributed in two groups. Off the north coast are the Frisian Islands, comprising Texel, Vlieland, Ter Schelling, Ameland, and others. In the southwest are the numerous islands of the great Rhine-Meuse-Scheldt Delta, among which are Voorne, Overflakkee, Schouwen Tholen, North Beveland, South Beveland, and Walcheren. The country is the flattest part of the Continent, mainly a region of monotonous stretches of plains, interrupted only by sand dunes and some other undulations and low hills, particularly in the southeast. One-fourth of this region adjoining the sea front lies below the level of the sea, a considerable part of it in North and South Holland as much as 20 feet. Thirteen per cent. lies between sea level and 3 feet above the sea. The mean height of the entire kingdom is only 30 to 33 feet above the sea.

Three features, the dunes, dikes, and polders, characterize the north and south belt nearest to the sea. The dunes stretching along the coast were formed by the winds and sea, which heaped up the ocean sands into rows of hills from 20 to 60 feet apart and from 35 to 200 feet high. Wherever they front the coast they are adequate protection against the sea. These sand ridges and hills are sparsely wooded, but are saved from disintegration by natural or cultivated growths of plants. Few parts of them are tilled, but the sandy regions behind them are carefully cultivated. The dikes are gigantic artificial embankments of earth faced with stone or protected by stakes. They guard the country against the sea at the places where there are no dunes. The largest is the Helder Dike. (See **HELDER**.) There are also smaller dikes, as a precaution against floods, on the banks of the Rhine and other streams. Inside the line of dunes and dikes are great numbers of polders, which are areas of land inclosed by dikes that not only protect them from floods, but also render it possible to pump out the water from within the inclosure. The land thus won with enormous toil is exceedingly fertile and valuable.

The lands reclaimed from the sea along the coast and the basins of the rivers in the south are the most industrial and populous parts of the Netherlands. Here are the richest pastures, where most of the fine breeds of Dutch cattle are reared and the dairy industry thrives. Back of these lowest lands and polders stretch the low plains strewn with the gravel and sand brought down from the north, with swellings of ground caused by deeper accumulations of this material; and in the east are many moors or bogs covered with moss and heather, many of which have been drained, the peat cut away for fuel, and the land reclaimed for cultivation. The country is not quite destitute of important elevations, for there are hills in the extreme southeast, and to some extent in the central east. One of these ranges attains a height of 690 feet, and in the provinces of Drenthe, Gelderland, Overijssel, Utrecht, and Limburg are gravel hills from 150 to over 300 feet in elevation; near Limburg is the highest elevation in the kingdom (1055 feet).

HYDROGRAPHY. The numerous bogs and marshes testify to the imperfect drainage. There are many small streams, but no large rivers except in the south. These large rivers flow in the

direction of the general slope of the country from east to west. They are all international streams, important in the commerce of Western Europe. The Rhine is the great highway between Western Germany and the sea. Entering Holland, it divides into numerous arms, the chief of which are the Waal, the Lek, and the Yssel. Four-fifths of the river trade of Holland is carried on the Rhine and the Waal, making Rotterdam a Rhine harbor. The Meuse (Dutch *Maas*) joins the Waal, thus mingling its waters with those of the Rhine, and is important in the commerce of Eastern Belgium. The Scheldt or Schelde, whose estuary is mainly in the Netherlands, carries ocean vessels to Antwerp, and small boats from the Netherlands ascend the river to the centre of Belgium. Lakes are scattered all over the country. Some of the lakes, such as the large Haarlem Lake, have been drained, and their beds converted into arable land. The stupendous undertaking of draining a great part of the Zuyder Zee is in progress.

CLIMATE. The climate is moist and with small range in temperature. The summers are not very warm, nor are the winters often very cold. With an average annual temperature of 50° F., the mean temperature is 49° in the spring and autumn, 64.4° in July and August, and 35.8° in January. The annual precipitation is about thirty inches, rain falling on about two days in three throughout the year. The fact that most days are misty and damp, a week of bright weather being a rarity, induces the diseases which characterize such conditions. Marsh fevers are also prevalent in the boggy districts; and though on the whole Holland is regarded as having a healthful climate, the annual death rate in the western lowlands is from 30 to 40 per 1000, which is about one-third greater than in other parts of the kingdom.

SOIL AND VEGETATION. The country is poor in vegetable products excepting cultivated plants. The most fertile regions are those with a stiff clay soil on the reclaimed lands of the northern and western provinces and on the fluvial clays along the large rivers. These are the chief agricultural and grazing lands, though the zone of cereals and some other crops also extends over a large part of the diluvial sands and gravels of the central regions. About one-fifth of the area is unproductive. The country is almost destitute of timber, scarcely one-fifteenth of the surface being occupied by woods. Pasturage covers about one-third of the country, and the arable lands, including the areas devoted to kitchen gardening, occupy rather less than a third of the surface.

FISHERIES. Fishing is an important source of wealth, the industry being divided into river and coast fishing and the deep-sea fishing. The chief product of the coast fisheries are sprats, which are packed for export, and the oyster, which thrives in the alluvial mud brought down by the rivers and is protected from high seas by the islands along the coast. The herring fishery is the most important branch of deep-sea fishing, the annual catch averaging about 250,000 tons.

GEOLOGY AND MINERAL RESOURCES. Nearly the whole surface is covered by very recent Quaternary formations, diluvium occupying 40 per cent. and alluvium 59 per cent. of the area. The coal measures, chalk, and Tertiary sands and loams occupy only about one per cent. of the surface

and are found only in the extreme east and south-east. The diluvium was spread over the country during the Ice Age from Scandinavia in the north, while in a later glacial period the Meuse and Rhine spread coarse sand and grit over the south. The winds, sea, rivers, and vegetation coöperated in the formation of the alluvial strata. Most of the country being composed of water or ice-borne débris, the supply of minerals is very small. Building stone is imported from Norway; the lack of this material has stimulated the production of brick and tile, which are made in abundance, chiefly from the Rhine clays, and are of superior quality. Some coal is mined near Limburg, but there is no iron, except a small quantity of bog iron ore obtained from the bog regions of the east. Turf or peat is cut in very large quantities.

AGRICULTURE. Over 500,000 of the inhabitants are engaged in agriculture, which has reached very high development in the northern and western provinces and along the southern rivers; but scarcely three-tenths of the surface is arable land, and the production fails to meet the home consumption. Rye, buckwheat, and potatoes are the chief products of the sandy soils; hops, sugar beets, tobacco, and wheat, of the clay soils. Rye, vegetables, and beet sugar are the chief agricultural products. The best farms are in the richer lands of the river valleys, the country ranking sixth in the production of beet sugar. Wheat from the United States supplements the home supply, only a small part of the people eating rye bread, as they prefer a mixture of rye and wheat. The cereal crops, in order of importance, after rye, are oats, wheat, buckwheat, and barley. Beans are also a large crop, and potatoes are the most important product after rye. Large quantities of vegetables are sent to England. The cultivation of flowers has reached a very advanced development, Haarlem being the centre of the flower industry, and exporting bulbs to all quarters of the world. Owing to very careful and scientific methods of tillage, the yield of all crops is large. In 1899 the land in farm crops was 2,139,144 acres; pastures, 2,929,123; gardens and orchards, 153,449; and forests, 624,421. Large areas of timber land were long ago cleared for cultivation, and the country is compelled to import most of its timber supply from various parts of Europe and from America.

STOCK-RAISING. As the moist climate promotes the growth of grass, animal rearing is the most important resource of the country. Cattle-raising has attained a development equaled in few other countries of the world. Cattle thrive best in the coast provinces. Dairy farming is also far advanced near the sea, and hundreds of thousands of the famous Dutch cheeses are sent to foreign markets, butter being also a large product. Horses are bred with great success in Friesland, Gelderland, and North Brabant. Sheep are reared more for their flesh than their wool, chiefly in North Holland and in the south. The poultry yards supply large quantities of eggs to England, and many tons of honey are produced, chiefly among the higher lands of the east.

MANUFACTURES. The country is of inferior importance as an industrial State. Coal and iron, the bases of large manufacturing development, are lacking, with the result that manufactures hardly meet the home demand, and only a few articles are exported. The metal indus-

tries have been little developed, though coal and iron are brought to Amsterdam, Rotterdam, and The Hague for the construction of railroad material, ships, machinery, and hardware. Many of the steel and iron ships owned in Holland are built in England. Tin plate is produced at The Hague, and gold and silverware are manufactured at Amsterdam; but few fancy articles in metals are produced. Textile manufactures have been largely developed since the separation from Belgium in 1830. Calicoes are made in large quantities for the East Indies, Africa, and China trade, representing usually an export value of about \$7,000,000 a year. The number of spindles is about 300,000, the leading factories being in Overijssel and North Brabant. Amsterdam, Haarlem, and Leyden have dye works and calico-printing works. Linen is manufactured chiefly in the southeast and North Brabant. The best quality of sailcloth is made in North and South Holland. Tilburg is the leading centre of the woolen industry, and the carpets of Deventer are in much request; but with the growth of the woolen industries in England, France, and Germany, Dutch woolens have declined in importance. Many towns make leather, and the manufacture of earthenware is spread all over the country. Brick and tile works are found in many places; clay pipes are made in South Holland; Delft still produces the glazed earthenware that made the town famous; Maastricht also produces stoneware and glassware. The diamond-cutters of Amsterdam are still famous, though their business is declining on account of the competition of Paris, London, and Antwerp. This industry is entirely in the hands of the Jews. Many industries are connected with the transformation of agricultural products, such as liqueurs, distilled from orange peel and other materials in Amsterdam, Rotterdam, and Schiedam, the same cities also leading in the production of Holland gin, distilled from rye. There were 516 distilleries in 1900, 503 breweries, and 9 vinegar works. Large quantities of cigars and manufactured tobacco from home-grown or East Indies leaf are made, the most extensive factories being at Amsterdam and Utrecht. The sugar refineries, chiefly in Amsterdam and North Brabant, are using every year more raw sugar from beet root and less from sugar cane.

COMMERCE. The Dutch trade embraces every continent, and is therefore first and chiefly maritime. Most exports of home products go to the neighboring countries of Europe. England, Germany, and Belgium are the largest buyers of the live animals, butter, cheese, and oleomargarine which the country exports. In 1900 the leading exports to neighboring countries of home products were: 49,000 cattle, 6000 calves, 49,000 sheep, 4000 swine, 51,000,000 pounds of butter, 120,000,000 pounds of oleomargarine, 102,000,000 pounds of cheese, and 336,000,000 pounds of sugar, besides eggs, vegetables, flax, and fish.

The exports of colonial products are sold all over the world, and the chief trade of the Netherlands is in the import and re-export of these colonial commodities. The Dutch colonial possessions in the East Indies, extending from Sumatra to New Guinea, are about sixty times as large as the mother country, and have seven times the population. Most of the tea, sugar, coffee, quinine, tin, tobacco, indigo, dyewoods, spices, and gums they export are sent to the Neth-

erlands, chiefly to Rotterdam and also to Amsterdam. Palm oil, rubber, and ivory from the Congo State, and guano and nitrates from South America are also imported. Some of these articles are greatly enhanced in value by manufacture in the Netherlands. Quinine, for example, is prepared for the market in the Netherlands, where also Java raw sugar is refined and Sumatra tobacco is made into cigars. The colonies, on the other hand, buy from the mother country great quantities of cottons and of other goods manufactured for them at home or purchased in other lands and sold by Dutch merchants in the colonies at a large profit. The colonies are the best customers of the Netherlands, excepting Europe.

Most of the imports for home consumption come from Northern Europe and the United States. The United States contributes about one-eighth of these imports, on an average, chiefly wheat, flour, maize, rye, petroleum, tallow, bacon, leaf tobacco, and lumber. Great Britain, Germany, Russia, and Belgium supply nearly all the other imports, consisting chiefly of coal, timber, metals, and manufactures. Most of the home trade, as distinguished from the colonial trade, is with these countries. The rapid growth of the imports for home consumption and the exports of home products may be seen from the following table, which shows the average annual trade:

	1882-86	1892-96	1901
Imports.....	\$448,500,000	\$602,500,000	\$622,894,000
Exports.....	342,500,000	490,000,000	700,686,000

The value of the imports and exports of the largest classes of products in 1901 was:

	Imports	Exports
Food products.....	\$230,136,960	\$213,021,408
Raw materials.....	182,478,654	131,392,494
Manufactured products.....	108,004,480	91,884,586
Miscellaneous.....	168,701,234	127,290,486

The following table gives the trade with leading countries in 1901:

	Imports	Exports
Belgium.....	\$90,781,200	\$70,510,800
Brazil *.....	8,400,000	
British India *.....	18,894,000	700,000
France.....	9,165,600	5,185,800
Great Britain.....	99,816,600	171,181,400
Prussia.....	174,387,600	349,297,800
Russia.....	64,320,000	3,836,600
Spain *.....	16,400,000	1,300,000
Dutch East Indies.....	130,047,000	24,723,000
United States.....	121,846,200	81,638,400

* The figures for Brazil (imports), British India (exports), and Spain (imports and exports) are given for 1899.

The Dutch derive large profit from the forwarding trade. They find the business of carrying freight for other nations a very profitable branch of commerce, and their position at the mouth of the Rhine gives them unsurpassed opportunities to pursue this branch of business. A great deal of the trade of Germany and also of Austria and Switzerland with other countries passes through the Netherlands, and most of it is tributary to Rotterdam, the port of the Rhine mouth and one of the greatest forwarding ports of the world. Amsterdam's connection by river and canal with the Rhine enables that city to take a large though inferior part in the transit

trade. The value of the goods carried in this transit business in 1900 was \$243,936,000.

Free trade is the Government policy, duties being levied on a few articles only for purposes of revenue. No article pays more than 5 per cent. duty, and grain, iron, wool, cotton, coal, and many other commodities are on the free list. The chief centres of domestic trade are Rotterdam, Amsterdam, Flushing, Dordrecht (timber), Middelburg, Leyden, Utrecht, Alkmaar, and Hoorn (cheese).

TRANSPORTATION AND COMMUNICATIONS. The largest routes of trade by water or rail converge on Rotterdam, Amsterdam, and Flushing. Great ship canals have given their preëminence to Rotterdam (318,507 inhabitants in 1900) and Amsterdam (510,900). Rotterdam, near the mouth of the Meuse, was threatened with being cut off from the sea by accumulations of sand in the river; a new waterway was therefore dug across the Hook of Holland through the dunes to the north of the Meuse, by which ships of the heaviest tonnage now reach the town. Fully three-fourths of the sea trade of the Netherlands pertains to Rotterdam, steamers plying between that city and all the largest ports of Western and Northern Europe and to the East Indies and United States. The traffic by sailing ships with the colonies and other distant lands is also very important. Amsterdam is also connected by regular lines of steamers with many ports of Europe, America, and Asia. The two ports command about nine-tenths of the total sea trade; Flushing, Middelburg, and Harlingen also have some importance. The Dutch merchant marine being small (213 steamers and 425 sailing vessels in 1900), a little more than one-half of the sea trade is carried under the British flag. Two ship canals connect Amsterdam with the sea. The older is the North Holland Canal, extending from Amsterdam to Alkmaar and Helder, 52 miles long, completed in 1825. By means of this canal the dangerous passage of the Zuyder Zee was avoided. In recent years, however, the importance of the canal declined, as it is not wide enough for the more modern large ships. The North Sea Canal was therefore built between Amsterdam and the North Sea, 16 miles in length and fully meeting the requirements of modern trade. These are the great ship canals of the Netherlands, but the whole country is a land of canals. All the towns and even the villages are connected with one another by these waterways. The larger canals are over 60 feet broad, 6 to 9 feet deep, and sometimes they lie higher than the fields through which they pass. The domestic traffic of the country is carried on the canals. There is little coasting trade, because commodities are carried from one port to another on the canals. The total extent of the canals is nearly 2000 miles, and the length of navigable waters outside of the canals is about 3000 miles.

The railroads are of more importance for international than for internal commerce. They carry most of the freight that England sends into Central Europe. Flushing, on the Scheldt, and Hook of Holland, near Rotterdam, are ports on the main rail routes between England and Germany. In 1900 the railroads had a length of 1830 miles, of which the State owned about one-half and private companies the remainder. Good wagon roads in all parts of the country, all paved with brick (klinkers), supplement the

other excellent means of communication. Their total length is about 3000 miles.

BANKING. All banks are private banks, but the Bank of the Netherlands is the only one that is permitted to issue bank notes, the amount of which, in 1901, was 221,869,000 florins, or \$89,191,338 in our currency. The money in general circulation, however, is chiefly silver. Two-fifths of the paper money in circulation must be covered. The bank secured the right to issue bank notes in 1863 for twenty-five years; in 1888 the right was prolonged for fifteen years, with a continuation for ten years more unless rescinded by the Government or the bank, two years' notice being given. In accordance with notice given by the Government in 1901, the present arrangement will terminate in November, 1903. The bank of the Netherlands has branches in all important towns, and does the same business as other banks, but provides more guarantees. It is the depository of the State funds and of the cash of the Post-Office Savings Bank. In 1901 the total exchanges of the bank were \$194,700,060; stock of gold, \$29,868,600; stock of silver, \$27,352,080; capital, \$8,040,000; reserve fund, \$2,211,000. The bank receives 5 per cent. of the profits, the balance being divided between the State and the bank. In 1899 there were 389 private savings banks, with 420,885 depositors and \$30,900,534 deposits. The State Postal Savings Bank, in 1900, had 829,131 depositors and \$44,048,194 deposits.

FINANCE. The sources of revenue in 1901 were: excise, \$20,211,500; direct taxation, \$14,500,872; indirect taxation, \$9,027,915; post-office, \$4,328,750; export and import duties, \$4,007,500; pilot dues, \$1,358,335; Government telegraphs, \$936,875; State domains, \$735,000; State lotteries, \$271,250; fisheries, \$55,000; railroads, \$1,807,560. The expenditures were: national debt, \$14,431,070; Department of War, \$9,465,180; Department of Public Works, \$12,241,695; Department of Finance, \$10,461,715; Department of Marine, \$6,940,705; Department of Interior, \$6,652,815; Department of Justice, \$2,645,795; Department of Colonies, \$548,840; Department of Foreign Affairs, \$355,505; royal household, \$333,335; superior State authorities, \$283,960; miscellaneous, \$20,830. The total revenue was \$56,971,100 and the expenditures were \$64,481,445. The total debt amounted in 1901 to \$482,806,435. About \$130,000,000 of the revenue of the past half century has been applied to the reduction of the public debt.

MONEY, WEIGHTS, AND MEASURES. The standard coin is the 10-florin gold piece, containing 6.048 grammes of fine gold. The unit of the silver coinage is the florin, containing 9.45 grammes of fine silver. The country has the gold standard, and gold and the silver coins issued before 1875 are legal tender. The value of the coins has for years been invariable. The principal coins are the guilder or florin of 100 cents, worth 40½ cents in our currency, and the gold piece of 10 florins. Metric weights and measures are used.

POPULATION. The population is most dense in the provinces of North and South Holland and Utrecht, which contain almost half of it, although embracing less than one-fourth of the total area. In these provinces are the three largest cities of the country. The annual increase of population averages considerably over

1 per cent. (in 1898, 1.41 per cent.; 1899, 1.28; in 1900, 1.47). The increase is due almost wholly to the excess of births over deaths. The people numbered by the census of 1899 5,103,979. Of the total population in 1900 2,560,239 were males and 2,618,807 were females. There were in 1899 52,625 persons of foreign birth living in the Netherlands, of whom 31,865 were Germans, 14,903 Belgians, 1307 English, and 4550 of other nationalities. The emigration is very small, amounting in 1900 to 1899 persons, nearly all of whom went to the United States.

The table of provinces, with areas and populations, is as follows:

PROVINCES	Area sq. miles	Population Dec. 31, 1899
North Brabant.....	1,960	553,842
Gelderland.....	1,965	566,549
South Holland.....	1,166	1,144,448
North Holland.....	1,070	968,131
Zeeland.....	690	216,295
Utrecht.....	534	251,034
Friesland.....	1,282	340,262
Overijssel.....	1,291	333,338
Groningen.....	790	299,602
Drenthe.....	1,030	148,544
Limburg.....	860	281,934
Total.....	12,648	5,103,979

EDUCATION. Attendance at school is not compulsory, and many of the people are illiterate, 14 per cent. of the adults in North Holland being unable to read. No religious instruction is given in the public schools, and a very large number of the youth attend denominational private schools. In 1900 there were 3108 public elementary schools, with 16,639 teachers and 508,276 pupils, and 1461 private elementary schools, with 7683 teachers and 231,534 pupils; 146 public infant schools, with 26,448 pupils, and 916 private infant schools, with 91,633 pupils. The polytechnic school (Delft) had 32 teachers and 714 pupils; 75 middle class schools, 1024 teachers and 10,299 pupils; 11 navigation schools, 71 teachers and 1564 pupils; 137 day and evening schools for working people, 1225 teachers and 18,478 pupils; 29 classical schools, 426 teachers and 2500 pupils. The four public universities at Leyden, Utrecht (qq.v.), Groningen, and Amsterdam have 167 teachers and about 3000 pupils. The Free University of Amsterdam charges no tuition. A number of art schools, museums, and military, music, normal, deaf mute, and technical schools are supported by the Government. Since 1889 public instruction has been diminishing and a larger number of school children have entered the private schools, which are now supported to a great extent by the State. The cost of public primary instruction is borne jointly by the State and the Communes.

RELIGION. There are numerous creeds and sects, and complete religious freedom. Most of the Protestants belong to the Dutch Reformed Church, and many other sects are represented. The Synod is the source of authority in most of the Protestant churches. The Roman Catholic Church is under an archbishop in Utrecht with the bishops of Breda, Haarlem, Bois-le-Duc, and Roermond; and the Old Catholics or Jansenists under an archbishop in Utrecht, and two bishops in Deventer and Haarlem. The Jews fall into two religious societies, the Dutch Israelites and the Portuguese Israelites. The adherents of

the different churches in 1899 numbered: Dutch Reformed, 2,471,021; other Protestant, 598,111; Roman Catholic, 1,790,161; Jansenists, 8754; Jews, 103,988; other creeds, 132,102. The larger part of the Catholics live south of the Rhine, and most of the Jews in North and South Holland.

CHARITABLE INSTITUTIONS. About five per cent. of the population are wholly or in part provided for by charities—about half by Church institutions, and most of the remainder by municipal organizations.

ETHNOLOGY. Of the early peoples of the Netherlands little is known, except that portions of the country were inhabited successively by tribes of the Stone, Bronze, and Iron ages. In the time of Cæsar the tribes of the swampy lowlands of the south were of Celtic stock, as the Nervii and Menapii. In the north were the Frisians and in the central portion were the Batavians and Canninefates, of Teutonic stock, speaking Low Dutch. The Batavians belonged to the Chatti, who had moved in from the east, pushing the Celts into the outskirts. During the Roman occupation the Celts of the south were crushed, the Frisians were compelled to pay tribute, and the Batavians were conciliated and later supplied the best of soldiers for the Roman armies. In the fifth century the Roman power was broken by the Germans, and in this period of the swarming of nations those westward-moving tribes overflowed the Netherlands. The Saxons amid these changes occupied the country and crossed over to England. The ethnical components have remained constant in the centuries that have intervened. The home of the Frisians, who in the early part of the Middle Ages dwelt along the coast as far south as the Scheldt, has been contracted to a small area. The anthropological survey of the country shows a preponderance of the long-headed, blond, tall, Teutonic type in the north and east, with cephalic index of from 79 to 80. In North and South Holland there is a large element having Alpine affinity, with cephalic index from 83 to 84. In Zeeland the pure Alpine or Celtic head-form is found with measures of from 85 to 88, dark hair and skin and medium stature, which is 1.655 meters, while that of the Teutonic element, as in Overijssel, is 1.701 meters.

GOVERNMENT. The basis of the present Constitution of the Netherlands is the fundamental law of 1815, as successively revised in 1840, 1848, and 1887. According to this Constitution the State is an hereditary monarchy, having the system of parliamentary or responsible government. The law of succession is lineal primogenial, with preference for males. In default of all legal heirs, the successor is determined by a joint meeting of the two chambers of Parliament (each containing twice the usual number of members). The sovereign attains his or her majority at the age of eighteen.

The legislative power of the Netherlands is vested conjointly in the sovereign and Parliament, or States-General. The Parliament consists of two chambers with considerable inequality of powers in legislation. The Upper Chamber is composed of 50 members elected by the legislatures (provincial councils) of the several provinces into which the kingdom is divided, and from among the highest taxpayers and certain high officials designated by law. Their term is nine years, one-third retiring every three

years. Those members not residing at The Hague, the seat of government, are allowed a compensation of about \$4.75 per day during the session of the Parliament. The Lower Chamber is composed of 100 members, chosen by districts and by direct suffrage. Those qualified to vote for members of the Lower Chamber include all male citizens twenty-five years of age, who are owners or tenants of houses or boats, or who possess certain evidences of capacity and business ability. At present, but little more than 11 per cent. of the population is qualified to vote under these provisions.

The members of the Lower Chamber serve for a term of four years, one-half retiring every second year. Any Netherlander who has attained the age of thirty years and who is in the full enjoyment of his civil and political rights is eligible to membership in the Lower Chamber. The members receive an annual salary of \$850, besides traveling expenses. The sessions of the chambers are public, although each by a majority vote may hold secret sessions. Either may be dissolved by the Crown without the sitting of the other chamber being disturbed, but in case of dissolution new elections must be held within forty days and the chambers convoked within two months. Ordinarily both chambers meet at least once a year, and may be summoned in extraordinary session by the Crown. The presiding officer of each chamber is appointed by the Crown, but minor officers are elected by the chambers respectively. The Upper Chamber has no power of initiating legislative measures, its authority being confined to the simple approval or rejection *in toto* of bills sent to it from the Lower Chamber. The Lower Chamber has the special power of appointing commissions of inquiry; it shares with the Crown the right of initiating legislative measures and may amend the bills presented by the Government; to it the Government must submit the annual budget; and it alone has the right to impeach the ministers before the High Court at The Hague.

The sovereign, who is declared to be inviolable and irresponsible, is required to take an oath to maintain the Constitution, the independence of the country, and the liberties and rights of the citizens, and to execute the laws. The powers of the Crown include the dissolution of the chambers, either jointly or separately; the declaration of war; the superior direction of foreign affairs; the negotiation of treaties with foreign powers subject to the approval of the chambers, when the cession or exchange of territory is involved, or when rights established by law are affected; the command of the army and navy, and the appointment of military officers; the superior direction of the colonies; the general administration of the finances; the granting of pardons (but not amnesties); the fixing of salaries of public officers except in case of the judges; and the decision of administrative conflicts between the provinces. The executive powers of the Crown are exercised through ministers, one of whom must countersign every official act of the sovereign, and who thereby assumes the responsibility for it. The political responsibility of the ministers is to the Parliament, to each house of which they are entitled to have access whether members or not, and to speak, although not to vote unless they be members. Each minister pre-

sides over a department of administration, of which there are at present eight. They are the Ministries of Foreign Affairs; Interior; Finance; Justice; Colonies; Marine; War; and Public Works and Commerce. Each minister receives an annual salary of \$5000. Besides the Cabinet there is a Council of State, presided over by the sovereign, and consulted by the Crown on a variety of important matters of State administration.

For the purpose of local government the Netherlands are divided into 11 provinces, and these are again subdivided into 1123 communes. The chief executive authority in each province is a commissioner of the sovereign. In each province is also a representative assembly consisting of members elected for a term of six years, one-half of the members retiring every second year. The number of members constituting an assembly varies from 35 to 80, according to the population of the province. The powers of the provincial assemblies are in general those of a local legislative body, and include such duties as the enactment of ordinances and the levy of taxes. All ordinances to be valid must be approved by the Crown. The assemblies exercise a supervisory control over the municipalities and elect the members of the Upper Chamber of the national Parliament. Ordinarily they hold sessions twice a year and are presided over by the commissioner of the sovereign. For the conduct of the provincial administration a deputation of six members is chosen from the body of the provincial assembly and is known as the 'Deputed States.' In each commune is a local council elected for a term of six years by the same electorate as that which chooses the members of the provincial assembly. The number of members varies from 7 to 41, according to the population of the commune, and one-third of the members retire every two years. The powers and duties of the communal council include the enactment of by-laws and ordinances relating to matters of purely local concern. These are all subject to the veto of the sovereign, while the budget and ordinances for the alienation of municipal property require the approval of the Deputed States of the province. The council is presided over by a mayor or burgo-master appointed by the sovereign for a term of six years. He is the chief executive officer in the commune, and is assisted by from one to four aldermen (the number depending upon the population of the commune) elected by the council from its own membership. The mayor exercises a supervisory power over the actions of the council and may suspend its resolutions for a period of thirty days. He also has charge of the municipal police.

The judicial system of the Netherlands consists of one High Court of Cassation, which sits at The Hague, five Courts of Appeal, 23 District Courts, and 106 cantonal tribunals. The High Court of The Hague has original jurisdiction in matters concerning the State, the royal family, and the impeachment of ministers and misdemeanors committed by the higher officials. It has appellate jurisdiction in cases appealed from the provincial courts and the courts in the colonies. All judges are appointed by the Crown for life, except the cantonal judges, whose tenure is limited to five years, and they are irremovable except by resolution of the High Court. Trial by jury does not exist in the Netherlands. Consult:

De Mombynes, *Constitutions européennes* (2 vols., Paris, 1881). For army and navy, see under **ARMIES** and **NAVIES**.

DEFENSE. There are few fortresses protecting the national boundaries. The chief, most effective defense lies in the ability to open the dikes and flood the region between the Lek and the Zuyder Zee.

COLONIES. The Netherlands are one of the important colonial powers. The Dutch colonies form two groups: the Dutch East Indies (q.v.) and the Dutch West Indies. The statistics—totals—are approximately: Area in square miles, Dutch East Indies, 736,400; Dutch West Indies, 50,230; total, 786,630; population in 1897, Dutch East Indies, 34,090,000; Dutch West Indies, 133,300; total, 34,223,300. The Dutch West Indies comprise the colony of Dutch Guiana, or Surinam (see under **GUIANA**), area 49,800 square miles, population 82,000; and the colony of Curaçao (q.v.), including the adjacent islands of Aruba (q.v.), Buen Ayre (q.v.), Eustatius (q.v.), Saba (q.v.), and half of Saint Martin (q.v.), total area 430 square miles, population 51,000.

HISTORY. The name Netherlands or Low Countries originally covered the territory included in the present kingdoms of the Netherlands and Belgium, with Luxemburg. This region was inhabited in Roman times by the Frisii in the north, the Batavi in the central portion, and the Belgæ in the south. These tribes were successively subjugated by the Romans—the Belgæ by Cæsar; the Batavi after Claudius Civilis, a Batavian leader, whose native name is unknown, had broken the Roman alliance and attempted to form a united Batavian kingdom (A.D. 69-70); and the Frisii still later after an obstinate resistance. The Low Countries were incorporated in the Empire of Charles the Great and Christianized. Upon the breaking up of the Carolingian Empire the new Frankish kingdom acquired the southern portion, Lotharingia (Lorraine) the central, and the new Germany the northern part. Coincidentally with this division came the rise of feudalism, and duchies like Brabant (originally Lower Lorraine), counties like Artois, Flanders, Holland, and Hainault, and bishoprics like Utrecht and Liège, developed a semi-independent authority in this remote district, where the weakened royal authority of the period reached with difficulty. (See **BELGIUM**.) It resulted also from the division of the country that, while the people as a whole retained certain traits due to their environment, the Dutch or northern provinces were distinctly Germanic in language and customs, the Flemings or Central Netherlands showed in both respects a mingling of French and German elements, while the Walloons on the south were as markedly French as the Dutch were German. In the latter part of the Middle Ages the cities of the Netherlands rose through their commerce and manufactures to an extraordinary state of prosperity, and some of them were for a time virtually independent republics. Next to the Italian States they figured most prominently in the revival of art. The cities of Flanders and Brabant were especially flourishing. Bruges, Ghent, and Antwerp had the largest share in this prosperity—Antwerp, at the beginning of the sixteenth century, eclipsing all other cities of Europe in the volume of its trade and its financial transactions. A marriage alliance between the House of Flanders and that of Burgundy (1369) gave

the Burgundian dukes, with their unbridled ambition for empire, a foothold in the Netherlands which they used to such purpose as to bring the whole country under their sway. (See **BURGUNDY**; **FLANDERS**.) The Hapsburg-Burgundian alliance (the marriage of Maximilian of Austria and Mary of Burgundy) in 1477 made the Low Countries an appanage of the House of Hapsburg. Charles V., the grandson of Maximilian, in 1549 formally united this rich inheritance with the Spanish crown. In 1555 he resigned the sovereignty over the Netherlands to his son Philip II. At this time they comprised the four duchies of Brabant, Gelderland, Limburg, and Luxemburg; the seven counties of Artois, Flanders, Hainault, Holland, Namur, Zutphen, and Zeeland; the margraviate of Antwerp, and the seigniories of Friesland, Groningen, Mechlin, Overysse, and Utrecht. These provinces were very largely independent of each other and prized this independence. The States-General, to which each sent deputies, served to unify them to some extent, and a supreme tribunal had jurisdiction over all; but the States-General was, like similar bodies in that age, politically weak, without power of legislation or taxation. The acquisition of the country by Spain brought into close political conjunction two bitterly antagonistic forces, for all save the Flemish or Southern Netherlands was becoming strongly Protestant, while Spain was the most Catholic country in Europe. Under Charles V. the Netherlands, which were included in the Burgundian Circle of the Holy Roman Empire, had been declared indivisible, and not subject to the Imperial courts. He had subjected the Protestants to severe persecution and had established the Inquisition, but it was reserved for Philip II. to show to what lengths bigotry, cruelty, and bad faith could be carried in the oppression of a people. The Government during the regency of Margaret of Parma was carried on by Cardinal Granvella (q.v.), who began at once to break the royal pledges and to trample upon the liberties of the people. Spanish troops were kept in the country and time-honored privileges and rights were ignored. Protest and resistance soon began under the leadership of William of Orange, Stadtholder of Holland, Zeeland, and Utrecht, Count Egmont, and the Count of Hoorne, which brought about the dismissal of the hated Minister (1564), but effected no change in Philip's policy toward the Netherlands. The league of the Beggars (see **GUEUX**) arose in 1566, and field preaching by proscribed Protestant ministers was carried on under the protection of armed multitudes. Mob violence broke out in many parts of the country and the resentment of the people showed itself in the plundering and desecration of churches and the destruction of images and relics. Philip II. proceeded to summary measures, strengthened by the support of a large peaceful element among the population who viewed with alarm the proceedings of the Beggars. In August, 1567, the Duke of Alva (q.v.) arrived with an army of Spanish veterans and authority to deal with the country as rebellious and conquered territory. Alva's Bloody Council, an irresponsible tribunal, condemned by wholesale Netherlands guilty of no offense save their religion and love of country, and in February, 1568, the Holy Office of the Inquisition pronounced a death sentence against

all the inhabitants of the Netherlands as heretics, with a few named exceptions. Among the notable victims of the tribunal were Counts Egmont and Hoorne. In the spring the Prince of Orange, who had fled the country, raised a small army and with his brother, Count Louis of Nassau, took the field for the liberties of the Netherlands, thus opening a desperate struggle lasting for forty years, during which most of the principal towns endured sieges by the Spaniards and suffered wholesale massacres when taken. In May Louis of Nassau defeated Count Aremburg, the Spanish Governor of Groningen, but he was driven from the field by Alva and fled to Germany with only a remnant of his troops. The first decisive triumph for the national cause was the capture of the fortified seaport of Briel by the 'Beggars of the Sea' under the Count de la Marck in April, 1572. This was followed by the revolt of the principal cities of Holland, Zeeland, and Friesland, and many cities in Gelderland and Overijssel. The Prince of Orange was proclaimed as lawful Stadtholder of the King of Spain. The fortress of Mons, in the south, was taken by Count Louis of Nassau, but the expected reinforcements from France did not arrive and the Massacre of Saint Bartholomew was a severe blow to the Protestant cause in the Netherlands. Mons was retaken by the Spaniards in September, and in rapid succession other places (Mechlin, Zutphen, and Naarden) fell into their hands, their course everywhere being marked by ruthless cruelty. Haarlem was defended by a garrison of 4000 men against an army of 30,000 men under Don Frederick, a son of the Duke of Alva, and after enduring a siege of seven months surrendered only when reduced to the very verge of starvation. The little town of Alkmaar repelled all assaults by the Spanish soldiery, and drove off an army of 16,000 men by cutting the dikes and flooding the country. In 1573 Alva was recalled by Philip II. and succeeded by Requesens.

On sea the Dutch repeatedly defeated the Spanish fleets, but on land they suffered a severe reverse in the battle on the moor of Mook, near Nimeguen (April 15, 1574), in which Louis of Nassau and his brother Henry were slain and their entire army destroyed. Leyden, besieged by an army of 8000 Spaniards under Valdez, held out for five months, and was saved by the cutting of the dikes, which enabled the vessels of the Gueux to bring relief to the town. The death of Requesens in March, 1576, was followed by a mutiny of the Spanish troops (the so-called Spanish Fury). Freed from all discipline and clamorous for their pay, which had long been withheld, they brought a reign of terror on the country. Ghent, Utrecht, Valenciennes, Maestricht, and Antwerp were taken and plundered, and in the last-named city 8000 citizens are reported to have been put to death. The southern provinces turned in terror to William of Orange for aid, and, with the exception of Luxemburg, entered into an alliance with the northern provinces, known as the Pacification of Ghent (November 8, 1576). The authority of Philip was still nominally recognized. The pacification was completed by the Union of Brussels, January, 1577, the object of which was primarily the expulsion of the mutinous Spanish soldiers. The new viceroy, Don John of Austria, the half brother of Philip II., in order to gain time, was compelled on his arrival to grant the demands

of the estates, and issued the Perpetual Edict, confirming the terms of the Pacification of Ghent. He won a great victory at Gembloux on January 31, 1578, but died in the same year, and was succeeded by Alexander Farnese, Duke of Parma, one of the ablest men of his day as well as one of the most unscrupulous, who administered affairs with energy until 1592. A shrewd judge of men, he used bribery as well as force to divide and weaken the resistance, and he succeeded in fomenting dissensions between the northern and southern provinces, which had little sympathy save that arising from resistance to common oppression. The southern provinces were in great part won back for Spain, but at Utrecht in January, 1579, the seven northern provinces, Holland, Zeeland, Gelderland, Utrecht, Groningen, Overijssel, and Friesland, entered into a union that was virtually the founding of the Dutch Republic, and on July 26, 1581, at The Hague, the seven provinces constituting the modern kingdom of the Netherlands declared their independence. William of Orange became the ruler of Holland and Zeeland, while the sovereignty over the other provinces was offered to the Duke of Anjou, brother of Henry III. of France. The latter, however, aroused the enmity of the people by his attempt to seize Antwerp, and left the country in 1583. On July 10, 1584, William of Orange was assassinated at Delft by an emissary of the Duke of Parma; but the United Provinces were saved from the full effects of the blow by affairs in France, where the struggle between the monarchy and the Catholic League diverted the attention of the Spanish King and led for a time to the withdrawal of the greater part of the Spanish troops from the Low Countries. In 1585 Antwerp, after a memorable siege of 14 months, was forced to surrender to the Duke of Parma. In 1585 an English army under the Earl of Leicester was sent by Elizabeth to the aid of the Dutch, but the incapacity of their commander made their assistance of little use, and in 1587 Leicester returned to England. The United Provinces nevertheless continued the struggle, guided by the statesmanship of Barneveldt (q.v.), and under the leadership of Maurice of Nassau, the eldest son of William of Orange. Maurice concluded a series of triumphant campaigns with the decisive victory of Nieuport, over the Archduke Albert of Austria, July 2, 1600. On sea the Dutch navies overwhelmed the Spanish forces and made themselves masters of the Spanish-Portuguese possessions in the East Indies. These years of warfare completed the desolation of the Spanish Netherlands. A respite came in 1609 with a twelve years' truce, which was a virtual acknowledgment of the independence of the Dutch Republic. For additional details of the struggle with Spain up to the truce of 1609, see articles on ALVA; EGOMT; FARNESE; GUEUX; JOHN OF AUSTRIA; PHILIP II.; WILLIAM I.; MAURICE (of Nassau).

Political and religious dissensions now arose in the Republic. The Arminian controversy in the Church mingled itself unhappily with the political differences between Prince Maurice, of Nassau, and Barneveldt. Finally Barneveldt was seized, condemned without fair trial, and executed May 13, 1619. See DORT, SYNOD OF; BARNEVELDT; GROTIUS.

In the course of the struggle with Spain the foreign trade of the provinces had undergone a

rapid expansion. The Dutch East India Company was organized in 1602. Following the discovery of the Hudson River by Henry Hudson, sailing for the Dutch East India Company in 1609, the Dutch established by degrees a trading colony in New Netherland, the later New York. The New Netherland Company was given a trading charter in 1615, and in 1621 the Dutch West India Company came into existence and began to people the new colony, which remained a Dutch possession until 1664, when it was taken by the English, to be recovered in 1673 for fifteen months, and then finally lost to the Republic.

In 1621, the twelve years' truce having expired and the Dutch refusing to acknowledge allegiance to Spain, the war was renewed by Philip IV. The Dutch, led by Prince Maurice until his death in 1625, and then by his brother Frederick Henry, with the French as allies, carried on a struggle for the possession of Flanders, the incidents of which served to increase the hostile feeling between the Catholic and Protestant parts of the country. In the meantime the religious dissensions in the United Provinces themselves died out and a spirit of toleration arose which made the country the asylum for European Protestant refugees. In 1646 Spain began negotiations for peace with the Republic, and the Dutch, already suspicious of the growing French influence, and themselves weary of the long struggle, made terms which became a part of the general Peace of Westphalia in 1648. The United Provinces were now fully recognized as free and sovereign States. The Scheldt was closed to commerce, and the right of the Dutch to a share in the trade of the Indies was acknowledged. William II., who succeeded Frederick Henry as Stadtholder of the Republic, attempted to become a sovereign with the aid of France, but died at the age of twenty-four, and the danger his ill-advised attempt had shown led the States to hold the stadtholdership in abeyance. Holland, the wealthiest of the provinces, now became the real controlling force, and the executive power in Holland was vested in the Grand Pensionary, an office which from 1650 to 1672 was held by Jan de Witt (q.v.). This was the golden age of the Republic, when its fleets fought successfully against the English (1652-54 and 1665-67), and made it the leading sea power of Europe. The prosperity, wealth, and power of the Republic brought it new enemies in the place of decadent Spain. Having united in 1668 with England and Sweden to hold Louis XIV. in check, the Republic found itself, in 1672, facing both France and England, the former attacking by land, the latter by sea. In this struggle William III., the young Prince of Orange, posthumous son of William II., by his generalship and patriotism won the approval of a large party of the nobles and common people, who demanded the restoration of the stadtholdership. France had demanded the restoration of the House of Orange to its authority, but William had declined to receive a gift forced by the enemies of his country. Jan and Cornelius de Witt, who opposed vesting any further powers in the House of Orange, were murdered by a mob (1672), and the Prince of Orange became once more Stadtholder and the central figure in the United Netherlands. In the shifting European policies of the succeeding years, the Republic found itself sometimes with one ally, sometimes with another, sometimes single-handed, but

with the calling of the Stadtholder William to the English throne (1688) it was brought into the large scheme of the Grand Alliance against Louis XIV. William of Orange and Heinsius (q.v.), the Grand Pensionary of Holland, were the soul of the resistance to the schemes of the French King. (See LOUIS XIV.) By the Peace of Utrecht, in 1713, closing the War of the Spanish Succession (see SUCCESSION WARS), the Spanish Netherlands were handed over to Austria. By the Barrier Treaty, concluded with England and Austria in 1715, the Dutch acquired the right of maintaining garrisons in the fortified towns of the Austrian (Belgium) Netherlands.

There was a decline in the prosperity of Holland in the first half of the eighteenth century. The stadtholdership had been again set aside, but it was restored in 1747 and made hereditary in William IV. of Nassau-Dietz. There were forty years of peace with the exception of a brief naval war with England, which broke out at the close of 1780. In 1782 the States-General formally recognized the United States of America as a sovereign and independent nation, being the second Government in Europe so to do. The Stadtholder's Government was essentially aristocratic, and in 1786 the rising democratic tide drove out William V., who, however, was restored in the following year through the intervention of Prussia. The revolutionary movement in France found an echo in the United Provinces, where the democratic party welcomed the conquests of Pichegru (q.v.). The stadtholdership was again overthrown, and the Batavian Republic was organized under French sympathizers and in close alliance with France in 1795. Napoleon made the Batavian Republic into the Kingdom of Holland, with his brother Louis as King (1806), but the latter was too faithful to the country to suit his Imperial brother and master, and he was compelled to abdicate (1810), and the country was annexed to the French Empire. In 1813 the French were expelled and the House of Orange was restored, and the Congress of Vienna (1815) annexed Belgium to Holland and created the new kingdom of the Netherlands under the sovereignty of William I., the son of the last Stadtholder. Luxemburg (q.v.) was at the same time erected into a grand duchy for the King of the Netherlands. In the course of the Napoleonic wars England seized the Dutch colonial possessions, and at their close was allowed to retain Cape Colony, Ceylon, and a great part of Surinam. The Catholics of the Belgian provinces were not content with the union with Holland, and revolted in 1830, and after fruitless attempts by the King to suppress the revolt, the Powers intervened and created the independent Kingdom of Belgium, under a guarantee of neutrality. (See BELGIUM.) A final settlement with Belgium was not effected until 1839, when Limburg and Luxemburg were divided between the countries. William I. abdicated in 1840 in favor of his son, William II., who was better able to enter upon harmonious relations with Belgium.

William II. was succeeded by William III. in 1849. The country for more than half a century has enjoyed a peaceful and prosperous development, untroubled by other problems than those of national finance, internal politics, and colonial administration. The last is a question of much magnitude, as the Dutch control over 35,000,000 more or less barbarous subjects, their

colonial possessions embracing in the Western Hemisphere, Dutch Guiana and Curaçao, and in the Eastern, Java, part of Borneo, Sumatra, Timor, the Moluccas, Celebes, and the western half of New Guinea. These are run as commercial ventures and are kept under rigid Government control. Slavery existed in the Western Dutch colonies until 1862 and a system of obligatory labor under official supervision still obtains in the Dutch East Indies. The Constitution, which had been much liberalized under the revolutionary influence of 1848, was further modified in 1887, when the suffrage was extended, the Upper House of the States-General, elected by the provincial estates, was enlarged to fifty, and the succession to the throne defined. King William III. died November 23, 1890, and was succeeded by his daughter, Wilhelmina Helene Pauline Maria (q.v.), who was born August 31, 1880, and was enthroned on her eighteenth birthday. She married Prince Henry of Mecklenberg-Schwerin, February 7, 1901. In 1898 the International Peace Conference, called at the suggestion of the Czar of Russia, was held at The Hague, which was made the seat of the international arbitration tribunal established by the conference. (See HAGUE PEACE CONFERENCE.) See POLITICAL PARTIES, section *Netherlands*.

HISTORY. The most thorough and scholarly history of the Netherlands is that of Blok, *Geschiedenis van het Nederlandsche Volk*, four volumes of which appeared by 1901, bringing the account up to 1648. There is an English translation, by Bierstadt and Putnam, *History of the People of the Netherlands* (New York, 1898-99). Consult also Rijsens, *Geschiedenis des Vaderlands* (Groningen, 1899); Kemper, *Geschiedenis van Nederland na 1830* (Amsterdam, 1873-75); Wenzelburger, *Geschichte der Niederlande* (Gotha, 1879-86); Grattan, *The History of the Netherlands* (Philadelphia, 1835); Davies, *History of Holland* (London, 1861); Motley, *Rise of the Dutch Republic* (New York, 1858); id., *History of the United Netherlands* (London, 1869); Rogers, *The Story of Holland*, "Story of the Nations Series" (New York, 1890); Seignobos, *Histoire politique de l'Europe contemporaine* (Paris, 1897); and for bibliography, Nijhoff, *Bibliographia historico-geographica Neerlandica* (The Hague, 1896); Thorne, "Reading List on the Netherlands," in *New York State Library Bulletin, Bibliography No. 9* (Albany, 1898).

NETHERLANDS SCHOOLS OF PAINTING. Under this title may best be grouped Flemish and Dutch schools, which possess in common certain distinctive qualities and have had a similar development. The Flemish school may be said to begin with Huybecht and Jan van Eyck (died 1440), whose remarkable improvement of oil painting revolutionized the art. The chief characteristics of the early Flemish school are a pronounced realism, highly detailed finish,

and the use of landscape background; its best painters had a good sense of color, perspective, atmosphere, light and shade. Jan van Eyck founded the school of Bruges, the chief centre in Flanders; and his follower or rival, Roger van der Weyden (died 1464), founded the school of Brabant, with a centre at Brussels, which was more emotional and dramatic in character. In the sixteenth century the chief seat of the Flemish school was at Antwerp, where Quentin Massys (died 1530) founded a school, which in the seventeenth century found its culmination in Rubens (1577-1640) and his pupils, Van Dyck and Jordaens. The productions of the later Flemish school are characterized by brilliant line and color, though they are materialistic and lack beauty of face and tenderness of feeling. Although Flemish as regards its characteristic realism, it was much influenced by Italian painting, especially in color. Contemporary with Rubens and his followers were a number of important genre painters, who were thoroughly Flemish, untouched by Italian influence. The chief representatives were Teniers the Younger, Brouwer, and Gonzales Coques. In the eighteenth century Flemish painting declined, and was of little importance.

The painting of the early Dutch school resembles that of the Flemish, and was much influenced by the Van Eycks. Haarlem is recorded as being the chief centre, but none of the works of the reputed founder of the school, Aelbert Ouwater (fifteenth century), survive. Its chief masters were Dierick Bouts (died 1475) and Lucas van Leyden (1494-1533). The sixteenth century was a period of Italian influence and unimportant productions, but the seventeenth was the golden age of Dutch painting. Haarlem remained the chief centre, and there was an important school at Amsterdam. With an entire absence of Italian influence, there arose an art more realistic, more distinctly national than the Flemish. The overthrow of Spain and Catholicism did away with the demand for religious paintings, which were superseded by portrait, genre, landscape, and animal subjects. In these the Dutch achieved perfection alike in color and design, but they seldom attempted larger compositions, in which they were indifferently successful. Among the Dutch artists in the seventeenth century, the chief masters in portraiture are Frans Hals and Rembrandt; the latter was equally great in landscape, and introduced light effects, which have not yet ceased to influence painting. In genre painting the most important were Adriaen van Ostade for peasant scenes, and Gerard Terburg for more refined subjects, besides Gerard Dou, Jan Steen, Pieter de Hooghe, and Jan van der Meer. The Dutch were the first to practice landscape and animal painting for its own sake; their greatest landscapists were Ruysdael and Hobbema, while in animal painting Wouverman, Paul Potter, Adriaen van de Velde, and Aelbert Cuyp are preëminent. In marines the greatest names are Willem van de Velde the Younger and Backhuysen; and in all the branches of still-life painting the Dutch excelled predecessors and contemporaries. In the nineteenth century a new school, distinctly Dutch, arose, including important artists like Israëls, the peasant painter, the brothers Maris in landscape, Meadag in marines, and Mauve in animal subjects.

BIBLIOGRAPHY. The chief source for the lives

of the painters, the Vasari of the Netherlands, is Van Mander, *Het schilder-boeck* (Alkmaar, 1604); also, Houbraken, *De groote schouburg der nederlandse kunstschilders* (Amsterdam, 1718). Of modern works, the best are: van Eyn-den and van der Willigen, *Geschiedenis der vaderlandsche schilderkunst, sedert de helft des 18de eeuw* (Haarlem, 1866); Immerzeel, *De levens en werken der Hollandsche en Vlaamsche kunstschilders* (Amsterdam, 1842-43); Blanc, *Histoire des peintres hollandais et flamands* (Paris, 1852-57); Fromentin, *Les maîtres d'autrefois: Belgique et Hollande* (Paris, 1876; English translation, Boston, 1882); Riegel, *Beiträge zur niederländischen Kunstgeschichte* (Berlin, 1882); Kugler, *Handbook of Painting—German, Flemish, and Dutch Schools* (Eng. trans., London, 1898); Van Dyke, *Old Dutch and Flemish Masters* (New York, 1896); Philipp, *Die Blüthe der Malerei in Belgien und Holland* (Leipzig, 1900-01).

For the Flemish school, consult: Michiels, *Histoire de la peinture flamande* (Brussels, 1865-74); Crowe and Cavalcaselle, *Early Flemish Painters* (London, 1872); Rooses, *Geschichte der Malerschule Antwerpens*, trans. by Reber (Munich, 1880); Van den Branden, *Geschiedenis der Antwerpsche Schilderschool* (Antwerp, 1883); and especially Wauters, *La peinture flamande* (Paris, 1884). For contemporary Belgian painting, consult: Lemonnier, *Histoire des beaux-arts en Belgique* (Brussels, 1881); De Mont, *Die graphischen Künste im heutigen Belgien* (Vienna, 1902). For the Dutch school, consult: Bode, *Studien zur Geschichte der holländischen Malerei* (Brunswick, 1883); Wurzbach, *Geschichte der holländischen Malerei* (Leipzig, 1885); Havard, *La peinture hollandaise* (Paris; English trans., New York, 1885); van der Willigen, *Les artistes de Haarlem* (The Hague, 1780); Vosmaer, *Onze hedendaagsche schilders* (Amsterdam, 1883-85).

NETH'ERSOLE, OLGA (1870—). An English actress, born in London, January 18, 1870. She appeared on the London stage in 1888 at the Royal Adelphi Theatre, having begun her career at Brighton the year before. She was soon a member of John Hare's company at the Garrick, where one of her early successes was in *The Profligate*. In 1890 she made a tour to Australia. Late in 1894 she first came to America, where she soon became well known in *Camille*, *Carmen*, *Sapho*, and other characters, one of her best being Paula in A. W. Pinero's *The Second Mrs. Tanqueray*, in which she appeared in New York in 1899. Consult Strang, *Famous Actresses of the Day in America* (Boston, 1899).

NETHINIM, nē'thē-nēm' (Heb., given [to God], from *nāthan*, to give). The lowest order of ministers of the Temple at Jerusalem, mentioned only in Chronicles and Ezra-Nehemiah. They are distinguished from the Levites, but were of sufficient importance to make Ezra solicitous for a large following of them with his mission to Jerusalem (Ezra viii. 17-20). They enjoyed the immunities of the priesthood (ib. vii. 24), possessed a distinct quarter on the Temple hill, along with allotments in the towns (Neh. iii. 31; Ezra ii. 70), and shared in the civic life of Israel (Neh. x. 28). Their name, along with their subordinate position, shows that the caste originally consisted of slaves piously devoted to the sanctuary, like the Greek hiero-

dules, to perform its menial duties. The tradition is preserved that David and his princes 'gave' these servants (Ezra viii. 20), one division of them being associated with Solomon (ib. ii. 55). The large number of foreign names among the Nethinim suggests that they were largely drafted from prisoners of war (cf. Joshua ix. 23). But time broke down the racial distinction, and their voluntary return after the Exile seems to have obliterated all degradation. The Talmud, with its often abstract view of history, outlaws them as heathen, but this view is contradicted by the Bible. Consult: Baudissin, *Die Geschichte des alttestamentlichen Priesterthums untersucht*, p. 142 (Leipzig, 1889); Ryle, "Nehemiah," in the *Cambridge Bible for Schools and Colleges* (Cambridge, 1893); Joseph Jacobs, *Studies in Biblical Archaeology* (London, 1894).

NETHOU, nā'tōō', PRO DE. The highest peak of the Pyrenees. It is situated in the Spanish Province of Huesca, immediately south of the French boundary, 40 miles west of Andorra. Its height is 11,169 feet, and it forms with the neighboring Pic de la Maladetta (10,867 feet) and Pic du Milieu (11,010 feet) the Maladetta group, a steep and jagged granite mass. On its northern slope lies an extensive glacier. The summit is often ascended for the splendid view which it affords.

NETS (AS. *net*, Goth. *nati*, OHG. *nezzi*, Ger. *Netz*, net, of doubtful etymology; possibly connected with Lat. *nassa*, weel). Open fabrics of cotton, linen, hemp, silk, or other material, whose threads usually cross each other at right angles, leaving a comparatively large open space between them. The open spaces in nets are called *meshes*. The threads may be tied at their intersection, thus constituting a true netting, or they may be simply crossed by the process of weaving. The art of net-making has been practiced from the earliest times. Even where the art of weaving was quite unknown, as in some of the South Sea Islands when first discovered, that of netting was well understood; hence we find among savage tribes, almost universally, nets are used not only for fishing, but also for entrapping land animals. Numerous illustrations of the use of nets for both purposes are found in the bas-reliefs of Assyria, Greece, and Rome, and in the mural paintings of Egypt.

A great variety of nets are in use among fishermen, but the principal are the *seine* and the *trawl*. The *seine* is a very long but not very wide net, one side of which is loaded with pieces of lead, and consequently sinks; the other, or upper side, is buoyed with pieces of cork, and consequently is kept up to the surface. When stretched out they constitute walls of net-work in the water, and are made to inclose schools of fish. The *trawl* is dragged along the bottom by the fishing-boat. It is a large net, often 50 feet wide and 100 feet deep, narrowing into a fine-meshed *purse* at the extremity, with pockets at the sides to retain the entangled fish. Sometimes the mouth is stretched apart by an iron beam, which rests upon supports shaped like runners, holding the distended net up about three feet from the sea bottom, while the belly of the net, held in front by the ground rope, drags along the bottom. Such nets, called *beam-trawls*, are operated in deep water by large fishing smacks.

Various kinds of nets are used in bird-catching, and also in catching quadrupeds, chiefly for the

purpose of inclosing spaces within which they are, but sometimes also for throwing upon them to confuse and entangle them. Nets are used by gardeners to protect crops from birds; also to protect the blossoms of trees from frost.

Other fabrics for various uses, with wide, open meshes are also called nets, as *hair-nets*, *mosquito nets*, etc. See also LACE; BOBBINET; BRUSSELS NET; KNITTING.

NETSCHER, nê't'shêr, KASPAR (1639-84). A Dutch genre and portrait painter, born at Heidelberg. He was the pupil of Koster at Arnheim, but belongs to the school of Terburg and Metsu. On a proposed journey to Italy he got as far as Bordeaux, and although he paid a second visit to France, he afterwards lived at The Hague, and was free of the guild in 1663. His best work is in portraiture on a small scale, and in small genre subjects. His earlier and middle works are superior to his later painting, in which his colors are often harsh and unpleasing. In his best period, Netscher is distinguished for the elegance and grace of his figures, especially of children—his mellow, golden tone, and his fondness for and skill in treating draperies and accessories. The Dresden Gallery is rich in good pictures by him. They include: "Gentleman with Guitar" (1665), "Lady with a Spaniel," "Lady at the Piano," and "Woman Singing," and two portraits of Madame de Montespan. The National Gallery, London, has his "Lady at a Spinning Wheel" and "Children Blowing Bubbles;" the Louvre, his "Singing Lesson" and "Violoncello Lesson;" the Metropolitan Museum, New York City, the "Portrait of a Dutch Lady;" and the Historical Society, "Madame de Montespan as Saint Cecilia." Several of his best works are in private collections in England. He also painted historical subjects, but with less success. His son and pupil CONSTANTYN (1668-1722), born at The Hague, was a genre and portrait painter in the same style. Another son, THEODORUS (1661-1732), born at Bordeaux, also a portrait and genre painter, lived in England for some time, and was esteemed there for his portraits.

NETSUKÉ, nê't's-kâ' (from Jap. *ne*, wood, root + *tsuké*, to suspend). A button of wood, crystal, or porcelain, but usually of ivory, by which the Japanese smoker suspends his outfit of tobacco, flint and steel, pipe, etc., from his girdle. Often the netsuké is elaborately carved, and is among the most characteristic products of native skill. The best specimens, which have engraved on them the mark of the carver, are very costly, and are valued by both native and foreign collectors, as objects of art.

NETTEMENT, nê't'mân', ALFRED FRANÇOIS (1805-69). A French journalist and historian, born in Paris. He early began to contribute to the magazines, and was a consistent Catholic in religion and legitimist in politics. In 1848 he founded the review *L'Opinion Publique*, and in it expressed his own opinions so forcibly that, after the coup d'état of 1851, the paper was suppressed and Nettelement imprisoned. Among his works are: *Histoire de la Révolution de juillet* (1833); *Histoire de la littérature française sous la Restauration* (1852); *Histoire de la littérature française sous la royauté de juillet* (1854); *Histoire de la Restauration* (1860-68); *Etudes critiques sur le feuilleton roman* (1845-46); and

Vie de madame la marquise de la Rochejacquelin (1858).

NETTER, THOMAS, also called WALDENSIS. from his birthplace, Saffron Walden, Essex (c.1375-1430). An English Carmelite monk. He studied at Oxford, and rose to eminence as a man of learning and business capacity. He was elected provincial prior of the English Carmelites in 1414, and was confessor to Henry V. and to Henry VI. He died at Rouen, France, November 2, 1430. He threw himself with great ardor into the lists against the Lollards, and so won the sobriquet of 'Prince of Controversialists.' His chief writings against them are *Doctrinale Fidei Ecclesiæ Catholicæ contra Wiclevitas et Hussitas*, and, especially valuable for its documents, *Fasciculi Zizaniorum Johannis Wyclif* (ed. by Shirley, London, 1858).

NETTLE (AS. *netele*, *netle*, OHG. *nezzila*, *nezila*, diminutive of *nazza*, nettle, Ger. *Nessel*, Ir. *nenaid*, nettle, probably connected with OPrus. *noatis*, Lith. *noterė*, Lett. *nâtres*, Gk. *adlên*, *adikē*, nettle). A common name of *Urtica*, a genus of plants of the natural order Urticacæ having unisexual flowers. The species are annual or perennial herbs with occasionally shrubby bases, many of them covered with stinging hairs, which emit an acid juice and pierce the skin when touched, often causing much inflammation and pain; when grasped in such a way as to press the hairs to the stem, no stinging ensues. The species of a number of distinct genera were formerly included in the genus, especially those having stinging hairs, as *Laportea*, *Pipturus*, and *Pouzolzia*. Some of these are shrubs or even trees, the giant nettle tree of Australia attaining great size. The sting of East Indian species is much more severe than that of European and American species. *Urtica crenulata* or *Laportea crenulata* is said to produce a sensation similar to the continual application of a hot iron, and even after the lapse of several days this may return upon the application of cold water, a sensation more or less pronounced with other species. The roots of nettles, boiled in alum, afford a yellow dye; and the juice of the stalk and leaves has been used to dye woollen stuffs a beautiful and permanent green. The small nettle (*Urtica urens*) and the great nettle (*Urtica dioica*), introduced European species, are abundant in America. Whatever gives nettles their stinging power is dissipated by boiling. The high value of nettles as food for swine, poultry, and particularly for turkeys, is well known to the peasantry of many countries; the great nettle is cultivated in Sweden for fodder. The seeds are nutritious to poultry, and it is claimed are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves of nettles are employed in some parts of England for the manufacture of a light kind of beer, called nettle beer. The bast fibre of nettles is used for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fibre of *Urtica dioica*, used by the ancient Egyptians, is still employed in Piedmont and other countries. When wanted for fibre, the plant is cut in midsummer, and treated like hemp. The names nettle yarn and nettle cloth are, however, now commonly given in most parts of Europe to particular linen and cotton fabrics. The fibre of *Urtica*

cannabina, a native of the south of Siberia and other middle parts of Asia, is much used; and from other species both fine lace and strong ropes can be manufactured. The fibre of *Urtica japonica*, or *Pouzolzia viminea*, is much used in Japan, and also that of *Urtica argentea* (or *Pipturus argenteus*) in the South Sea Islands, and of *Urtica gracilis* in Canada. *Urtica tuberosa*, or *Pouzolzia tuberosa*, produces nutritious tubers, which are eaten in India raw, boiled, or roasted. Australia produces a magnificent tree-nettle, *Laportea Gigas*, abundant in some parts of New South Wales, which sometimes reaches a height of 140 feet with a trunk of great thickness, and very large green leaves, which, when young, sting violently. In some places it forms scrub forests, and its stinging leaves form a great impediment to the traveler. The common nettle tree of the United States is a species of *Celtis* (see HACKBERRY); the name dead nettle is given to certain species of *Lamium*, a genus of the order Labiatae. *Bæhmeria nivea*, often called false nettle, supplies China grass or ramie (q.v.).

NETTLE-BUTTERFLY. Any of several species of butterflies, whose eggs are laid upon the leaves of nettles, namely *Pyrameis Atalanta*, *Pyrameis cardui*, and *Vanessa urticae*, the last, as its scientific name shows, being an especial frequenter of these plants. The two former are cosmopolitan, while the *Vanessa* is European.

NETTLE FAMILY. A natural order of plants. See URTICACEÆ.

NETTLE RASH. An affection of the skin of nervous origin, due to the poison of the nettle, and consisting of wheals of red color, extremely tender and also itching. The slightest contact with the hair or spine of the nettle will cause an efflorescence of the eruption, which first appears as white elevations, but rapidly turns red. The true primary cause of the eruption is the special susceptibility of the vaso-motor nervous system. Hence for a few people the saying is true: "Grasp the nettle and it will not sting you." See URTICARIA.

NETTLESHIP, HENRY (1839-93). An English classical scholar, born in Kettering, Northamptonshire, England, May 5, 1839. He was educated at the Cathedral School, Durham, Charterhouse, and Oxford, where he was elected Fellow of Lincoln, and gained the Chancellor's Latin Essay Prize. From 1868 to 1873 he was assistant master at Harrow. In 1870 he married the eldest daughter of Rev. T. H. Steel, his colleague at Harrow. In 1873 he was appointed fellow and tutor of Corpus Christi College and classical lecturer at Christ Church, Oxford, which appointments he resigned on being made Corpus professor of Latin literature in the University of Oxford, 1878. He published and edited many classical works, among them a commentary on *Æneid* x. and xii.; a revised edition of Conington's *Vergil* (London, 1883); *Lectures and Essays on Subjects Connected with Latin Literature and Scholarship* (Oxford, 1885; second series, edited by Haverfield, Oxford, 1895); and *Contributions to Latin Lexicography* (Oxford, 1889).

NETTLESHIP, JOHN TRIVETT (1841-1902). An English animal painter and author, born at Kettering. He was a pupil at Heatherley's and at the Slade School, under Poynter, and studied animal life at the Zoological Gardens. His fa-

vorite subjects were lions, bears, and tigers. His drawing is accurate, and his treatment broad and masculine. He began to exhibit in 1874. His pictures include: "The Destroyer" (1889); "A Death Grip" (1892); "Rich Spoil" (1893); "A Big Drink" (1893); "The Blood Trail" (1895); "The Honey Stealer" (1896); "Into the Silent Sea" (1900); "Wandering" (1902). He also wrote *Robert Browning: Essays and Thoughts* (1890), a valuable and illuminative work, and *George Morland, and the Evolution from Him of Some Later Painters* (1898).

NETTLETON, ALFRED BAYARD (1838—). An American soldier and journalist, born at Berlin, Delaware County, Ohio. He studied at Oberlin College, but at the outbreak of the Civil War enlisted as a private in the Federal army, and before the conclusion of peace rose to the rank of colonel of the Second Ohio Cavalry and brevet brigadier-general. He then studied law, but afterwards did newspaper work in Sandusky, Ohio, Chicago, Philadelphia, and Minneapolis. From 1870 to 1875 he was actively interested in the construction of the Northern Pacific Railroad, and for the next five years in various mining and manufacturing enterprises. He was Assistant Secretary of the United States Treasury from 1890 to 1893, and for a short time after Secretary Windom's death served as Secretary.

NETTLE TREE. Various American ornamental trees and shrubs of the natural order Urticaceæ, known by sundry popular names, as hackberry (q.v.).

NEUBAUER, NOI'BOU-ÉR, ADOLF (1832—). An English Semitic scholar, born in Hungary, and educated at Prague, Munich, and Paris. He was sub-librarian of the Bodleian Library at Oxford in 1873-99, and reader of Rabbinical literature to the university in 1886-1900. Neubauer published *Medieval Jewish Chronicles and Chronological Notes* in the Semitic Series of the "Anecdota Oxoniensia;" *Histoire de la lexicographie hébraïque* (1861-62); *Géographie du Talmud* (1868); *The Book of Hebrew Roots* (1875); *The Book of Tobit* (1878); *Catalogue of Hebrew Manuscripts in the Bodleian Library* (1886); and *On the Dialects Spoken in Palestine at the Time of Christ* (1888).

NEUBER, NOI'BÉR, FRIEDERIKE KAROLINE (1697-1760). A German actress. She was born in Reichenbach, and her maiden name was Weissenborn. From the undue restraint of her father's house, she fled in 1718 with her lover, Neuber, to Weissenfels, where they joined some strolling comedians. Seven years afterwards, with another company which she had entirely reorganized, she appeared at Leipzig. Meeting Gottsched, she became a convert to his gospel of French classical methods. In 1737 she presented the play *Vertreibung und Tod des Hanswurst*. A short tour to Saint Petersburg (1740) seems to have been the turning point in her career. She quarreled with Gottsched on her return, lost her company twice, and she failed in her attempt to rehabilitate her fortunes as an actress. Consult the biography by Von Reden-Esbeck (Leipzig, 1881).

NEUBRANDENBURG, NOI-BRÄN'DEN-BÖÖRK. A town in the Grand Duchy of Mecklenburg-Strelitz, Germany, near Lake Tollense, about 18 miles northeast of Neustrelitz (Map: Germany, E 2). Its old walls, still standing, and its four

handsome Gothic gates give the town a mediæval appearance. The Gothic Marienkirche dates from the thirteenth century. Near by is the grand ducal pleasure palace of Belvedere. There are manufactures of machines, pianos, paper, and brandy. Population, in 1900, 10,560. Neubrandenburg was founded in 1248.

NEUCHÂTEL, nē'shâ'tēl', or **NEUFCHÂTEL**. The capital of the canton of the same name in Switzerland, situated on the Lake of Neuchâtel, about 25 miles west of Bern (Map: Switzerland, A 2). It is a well-built town, with a picturesque location and fine public buildings. A beautiful avenue extends along the waterfront, and one of the squares is adorned with a statue of the Neuchâtel merchant, David de Purry, to whose generosity the town owes many of its institutions. The twelfth century abbey church contains a fine monument, erected in 1372, to the counts of Neuchâtel. The old château is now the seat of the cantonal government. Neuchâtel is well provided with educational institutions, which include a Latin college with a valuable natural history collection, an academy with four faculties, a gymnasium, a museum of natural history, an historical and ethnographical museum, a museum of fine arts, and a library of 100,000 volumes. There are a number of private boarding-schools, attended mostly by foreigners. Near the town is the cantonal observatory. The industries of Neuchâtel include the manufacturing of watches, electrical apparatus, and jewelry. The trade is of some importance. Population, in 1900, 20,843, chiefly French Protestants. For history, see the article on the Canton of Neuchâtel. Consult Bachelin, *Neuenburg und Umgebung* (Zurich, 1883).

NEUCHÂTEL, or **NEUFCHÂTEL**, nē'shâ'tēl' (Ger. *Neuenburg*). A western canton of Switzerland, bounded on the north by the Canton of Bern, on the east by the Canton of Bern and the Lake of Neuchâtel, on the south by the Canton of Vaud, and on the west by the French Department of Doubs. Area, 312 square miles (Map: Switzerland, A 2). The whole country belongs to the region of the Jura, and is generally divided into three parts: the region along the lake, ranging in altitude from about 1400 to over 2000 feet, and famous for its wine; the central portion, with an average altitude of over 2700 feet and producing principally cereals; and the forest region of the west, devoted chiefly to pastoral purposes. Hydrographically the canton belongs partly to the Aare and partly to the Doubs. The principal minerals are asphalt, cement, and building stones. Besides agriculture, viticulture, and stock-raising, the fundamental industries of the canton, the inhabitants are engaged in watch-making, distilling, and in manufacturing cables, electrical apparatus, paper, and chocolate. The Constitution of the canton, originally adopted in 1858, provides for a grand council elected directly for three years at the rate of one member to every 1000 inhabitants. The five members of the executive council are appointed by the grand council for three years. The referendum was adopted in 1879, and the initiative in 1882. For the administration of justice there are a number of justices of the peace, several industrial arbitration courts, and a court of appeals at Neuchâtel. The canton is represented by five members in the National Council. For ad-

ministrative purposes Neuchâtel is divided into six districts. Population, in 1890, 108,153; in 1900, 126,279. Most of the inhabitants are Protestants and speak French. Capital, Neuchâtel (q.v.).

The mediæval countship of Neuchâtel passed in 1504 to the House of Orléans-Longueville. In 1707, on the extinction of the Neuchâtel branch of the latter family, 15 claimants came forward, among them Frederick I., of Prussia, whose mother was a princess of the House of Orange, which was connected by descent with the House of Châlons, to whose overlordship Rudolph of Hapsburg had subjected Neuchâtel in 1288. Frederick I. was the successful candidate; and from his time Neuchâtel continued associated with Prussia till 1806, when Napoleon bestowed it upon General Berthier. In 1814 it was restored to the House of Brandenburg, and in the same year became a member of the Swiss Confederacy. It became a republic in 1848. Its connection with the Prussian monarchy has been dissolved since 1857.

Consult: Grandpierre, *Histoire du canton de Neuchâtel sous les rois de Prusse* (Leipzig, 1889); Quartier-la-Tente, *Le canton de Neuchâtel. Revue historique et monographique* (Neuchâtel, 1897).

NEUCHÂTEL, LAKE OF (Ger. *Neuenburger See*). A lake in the western part of Switzerland lying along the eastern base of the Jura range, 19 miles north of the Lake of Geneva (Map: Switzerland, A 2). It is 24 miles long and from 2 to 5 miles wide, being the third largest lake of Switzerland. Its shores, which are very little indented, are partly low and marshy, partly hilly, and covered with forests or vineyards. The lake may be considered as an expansion of the River Thièle, which enters at the southern end, and leaves it at the north on its way to the Aare. It was an important commercial route until railroads were built along its banks, and is traversed by regular lines of steamers between the towns of Neuchâtel and Estavayer.

NEUDÖRFER, noi'dēr-fēr, JOHANN (1497-1563). A German writing-master and calligrapher, born at Nuremberg. He became the foremost representative of his profession, which, despite the invention of printing, was still widely and skillfully practiced, and highly esteemed. His manuscripts were beautifully decorated with gold and other colors, but his chief attention was directed toward an elegant formation of the letters of the German alphabet. He thus developed the German Gothic characters to their perfection, and secured their general use. Of his autographs there are known to exist only the signatures to the Gärtner copies of Dürer's two paintings, "The Temperaments" (in the Germanic Museum, Nuremberg), and a letter of June 7, 1556 (in the municipal archives of Nuremberg.) He also wrote in 1547 the *Nachrichten von nürnbergischen Künstlern und Werkleuten*, whose 79 brief notices are important sources regarding the history of Nuremberg of the early sixteenth century.

NEUENDORFF, noi'en-dōrf, ADOLF (1843-97). A German-American musician, conductor, and operatic impresario. He was born in Hamburg, Germany, but at the age of twelve years came to America, where he completed his musical education. He first came before the public

in 1859 as a concert pianist, and in 1860 became the solo violin in the Stadt Theater orchestra of New York. The following year he toured Brazil, and on his return was appointed musical director of the German Theatre in Milwaukee, Wis. To him is due the credit of introducing Wagner's *Lohengrin* into the United States, at the Stadt Theater, New York. He also introduced Wachtel (the famous tenor), and the following year (1872) conducted the season of grand opera at the Academy of Music (New York). *Die Walküre* also received its first presentation in this country at his hands (1877), and in 1878 he was appointed conductor of the New York Philharmonic Society. From 1884 to 1889 he was a concert director in Boston, after which he became associated with the management of several successful opera companies. His wife, Georgine von Januschowsky, was prima donna of the Imperial Opera, Vienna, in which city he spent two years (1893-95), returning in 1896 to become musical director of the Hebrew Temple Emanu-El. In 1897 he conducted the Metropolitan Orchestra. He was the composer of operas, symphonies, overtures, and many songs, which enjoyed considerable success. He died in New York.

NEUENKIRCHEN, noi'en-kêr'ën. A town of Austria. See NEUNKIRCHEN.

NEUFCHÂTEAU, nê'shâ'tô', FRANÇOIS DE. See FRANÇOIS DE NEUFCHÂTEAU.

NEUFCHÂTEL, nê'shâ'têl'. A canton and a city of Switzerland. See NEUCHÂTEL.

NEUHAUS, noi'hous. A town of Bohemia situated 70 miles southeast of Prague (Map: Austria, D 2). It contains a mediæval castle and a college, and manufactures cloth and woolen goods. Population, in 1900, 9316.

NEUHÄUSEL, noi'hoi-zel (Hung. *Ersekújvár*). A town of Hungary, situated on the Neutra, 55 miles northwest of Budapest (Map: Hungary, F 3). It has a fine church, a Franciscan monastery, and a gymnasium. Prior to 1724 it was a strong fortress and played a prominent part in the Turkish wars. Population, in 1900, 13,385, mostly Catholic Magyars.

NEUHOF, noi'hôf, THEODOR STEPHAN VON, Baron (c.1686-1756). A German adventurer and King of Corsica. He was born in Metz, the son of a Westphalian nobleman in the French service, and became page to the Duchess of Orleans. He then enlisted in the French army and later in the army of Sweden, where the Minister Goertz discovered him, and employed him on secret diplomatic missions. In 1719 Neuhof was in Spain, enjoying the protection of Ripperda. There he married a daughter of Lord Kilmallock and ran away with her diamonds to France. Begged by Law, he lived in misery till 1732, when the Emperor Charles VI. made him chargé d'affaires at Florence. In Florence Neuhof rendered some service to several Corsican patriots, who in return invited him to become King of Corsica and fight its battles against Genoa. He landed in Corsica in March, 1736, was proclaimed King as Theodore I., and with help obtained from the Dey of Algiers defeated the Genoese. He left the island soon to seek assistance abroad, and came back in 1738 with reinforcements from Holland. But the French had come to the aid of the Genoese and Neuhof fled. He made one more attempt on Corsica in 1743, when the islanders displayed re-

markable devotion to his cause, but failed, and after long wandering went to England in 1749. There he was thrown into prison by his creditors and was released through the intercessions of Horace Walpole only a few months before his death. Neuhof's son published his life in *Mémoires pour servir à l'histoire de Corse* (1768). Consult Fitzgerald, *King Theodore of Corsica* (London, 1890).

NEUILLY, nê'yê'. A suburban municipality of Paris, in the Department of Seine, on the right bank of the river Seine, and bordering on the city wall to the north of the Bois de Boulogne (Map: Paris and vicinity). It is a favorite residential section of Parisian merchants, and has sanatoriums, hospitals, and five parks, and in connection with Parisian houses, establishments manufacturing patent leather, chemicals, and starch, and preserving meat. In a large and beautiful park along the Seine formerly stood the Château de Neuilly, built by Louis XV., and the favorite residence of Louis Philippe, who after his deposition assumed the title of Count of Neuilly. The château was destroyed in the Revolution of 1848; and the park, afterwards divided into lots for sale, became an elegant residential quarter. Population, in 1900, 37,493.

NEUKOMM, noi'kôm, SIGISMUND VON (1778-1858). An Austrian composer and orchestra leader, born at Salzburg. He studied under Weissauer the organist, and Michael and Joseph Haydn, the latter of whom was devoted to his protégé's interests, and was mainly instrumental (in 1804) in securing for Neukomm the leadership of the German opera at Saint Petersburg. In 1809 he went to Paris, where he gained the friendship of Grétry, Cherubini, and Talleyrand, and in 1815 received the Cross of the Legion of Honor. In 1816 he went to Rio de Janeiro and was appointed music teacher to the Crown Prince Dom Pedro. He returned in 1821, and lived at Talleyrand's house in Paris. He was a prolific composer and has nearly 300 compositions to his credit, ranging from opera to simple ballad. His sacred music alone survives, the oratorios *Mount Sinai* (1831) and *David* (1834) being still popular in England and Germany. He died in Paris.

NEUMANN, noi'mân, FRANZ ERNST (1798-1895). A German physicist, born at Joachimsthal, near Berlin. He took part in the War of 1815, and afterwards studied at the universities of Jena and Berlin. He received his doctor's degree in 1826, and in 1828 he was made professor of physics and mineralogy in the University of Königsberg. His researches were chiefly along the line of mathematical physics, and he contributed to the theories of the reflection and refraction of light, and of double refraction, to the study of crystals of double axes, and to the methods of determining the specific heat of bodies. His chief publications (published by his pupils) are: *Vorlesungen über die Theorie des Magnetismus* (1881); *Einleitung in die theoretische Physik* (1883); *Vorlesungen über elektrische Ströme* (1884); *Vorlesungen über theoretische Optik* (1885); *Vorlesungen über Theorie des Potentials* (1887); *Ueber ein allgemeines Princip der mathematischen Theorie inducirter elektrischer Ströme* (1892). About a hundred of his memoirs appeared in the *Annalen*, *Crelle's Journal*, and the *Astronomische Nachrichten*. Consult Volkmann, *Franz Neumann* (Leipzig, 1896).

NEUMANN, JOHANN BALTHASAR (1687-1753). A German architect, born at Eger, Bohemia. In 1711 he entered the artillery service at Würzburg, and through the patronage of Prince-bishop Johann Philipp von Schönborn, was enabled to travel in Italy, France, and the Netherlands, as a result of which he developed into one of the foremost architects of the Rococo style of his time. He built the magnificent episcopal palace at Würzburg (1720-42), whose imposing staircase is its most notable feature. Even more original, though on a smaller scale, is the palace at Bruchsal. Regarding other structures by him, consult Keller, *Balthasar Neumann* (Würzburg, 1896).

NEUMANN, KARL FRIEDRICH (1793-1870). A German Orientalist, born at Reichmannsdorf, Bavaria. He was educated at the universities of Heidelberg, Munich, and Göttingen, in 1821-25 was an instructor in the gymnasium at Speyer; and later, at the Mechitarist cloister and academy on the island of San Lazzaro, Venice, made a study of the Armenian language and literature, some results of which appeared in his *Geschichte der armenischen Litteratur* (1836). He also made several translations into English of Armenian chronicles for the Oriental Translation Fund of London. During a visit to China he acquired an extensive knowledge of the Chinese tongue and a library of 12,000 printed books, which he presented to the Bavarian Government. In 1833 he was appointed at Munich professor of the Armenian and Chinese languages, but in 1852 was retired because of his expression of liberal political views. He further wrote a *Geschichte des englischen Reichs in Asien* (1857), and a *Geschichte der Vereinigten Staaten von Amerika* (1863-66).

NEUMANN, KARL GOTTFRIED (1832—). A German mathematician, son of Franz Ernst Neumann, the physicist. He was born and educated in Königsberg, was professor at Halle, Basel, and Tübingen, and in 1868 became professor at Leipzig, founding in the same year the *Mathematische Annalen*. He devoted himself mainly to the theory of functions, and to mathematical physics, and may be considered the founder of the theory of logarithmic potential. Neumann edited various papers written by his father and published: *Theorie der Besselschen Funktionen* (1867); *Ueber die elektrischen Kräfte* (1873 and 1898); *Vorlesungen über die mechanische Theorie der Wärme* (1875); *Untersuchungen über das logarithmische und Newtonsche Potential* (1877); *Hydrodynamische Untersuchungen* (1883); *Vorlesungen über Riemanns Theorie der Abelschen Integrale* (1884); and *Allgemeine Untersuchungen über das Newtonsche Princip der Fernwirkungen* (1896).

NEUMANN-SPALLART, SPÄHLART, FRANZ XAVER VON (1837-88). An Austrian political economist, born and educated in Vienna. He was professor of economics there in the Commercial Academy (1864-68), at the Military Academy (1868-71), and at the university and the Agricultural College. With Bodio he was one of those most influential in forming the International Statistical Institute; and he was long connected with the Austrian Central Commission on Statistics. As an economist he was a zealous worker in the interest of free trade in Austria, and founded the Association for Economic Progress.

Neumann published: *Oesterreichs Handelspolitik* (1864); *Volkswirtschaftslehre mit besonderer Anwendung auf Heerwesen und Militärverwaltung* (1873); and the valuable year-book *Uebersichten in der Weltwirtschaft* (1878-89), continued by Juraschek.

NEUMARK, NOI'MÄRK, GEORG (1621-81). A German poet. He was born at Langensalza and studied at Königsberg. At Kiel, where he was engaged as a tutor, he wrote his famous song "Wer nur den lieben Gott lässt walten." Neumark was a member of the poetical guild called the *Palmenorden*, and he wrote its history, *Der neusprossenden deutschen Palmbaum* (1668). Consult Knauth, *Georg Neumark nach Leben und Dichten* (Langensalza, 1881).

NEUMAYER, NOI'MË-ËR, GEORG (1826—). A German meteorologist and hydrographer. He was born at Kirchheimbolanden, Bavaria, was educated at the Polytechnic and the University of Munich, and in 1857 was sent by Maximilian II. to Australia to make magnetic observations. At Melbourne Neumayer founded Flagstaff Observatory. He returned to Germany in 1864, interested himself in the formation of expeditions to the North and South Poles, and in founding the German African Company, and, after a long connection with the hydrographic bureau at Berlin, in 1876 became director of the German Marine Observatory at Hamburg. He was prominent in behalf of the international polar expedition planned in 1882, and in arranging for the German Antarctic expedition of 1901. Neumayer wrote: *Results of the Observations at the Flagstaff Observatory* (1858-63) and *Results of the Magnetic Survey of Victoria* (1869); *Beobachtungsergebnisse der deutschen Stationen im Systeme der internationalen Polarforschung* (with Börgen, 1886); *Die deutsche Expedition und ihre Ergebnisse* (1890-91); *Atlas des Erdmagnetismus* (1891); *Anemometer-Studien* (1897); and *Auf zum Südpol!* (1901).

NEUMAYR, NOI'MÏR, MELCHIOR (1845-90). An Austrian geologist. He was born in Munich, studied there and at Heidelberg, where, after four years in the Imperial Geological Institute at Vienna, he became docent in 1872. He soon returned to Vienna and became full professor of geology and paleontology in 1880. Neumayr traveled widely in Southern Europe, making an especial study of the life and coördination of the Jurassic formations, the results of which appeared in the German geological magazines. He coöperated on *Geologische Studien in den Küstenländern des griechischen Archipels* (1880); and wrote *Die Stämme des Tierreichs. Wirbellose Tiere* (1890), and a general work on geology entitled *Erdgeschichte* (1885-87; 2d ed. 1895). The last-named work, while written in a popular style, may be commended for its comprehensiveness and scientific accuracy.

NEUMEISTER, NOI'MIS-TËR, ERDMANN (1671-1756). A German hymn-writer, born at Uechteritz, near Weissenfels, and educated at the University of Leipzig. He is chiefly remembered for his hymns, some of which are of great merit and are still in use, such as "Jesus nimmt die Sünder an," "Will ich sagen," and "Lass irdische Geschäfte stehn," which have been translated into English. He also published a *Specimen Dissertationis Historico-criticæ de Poetis Germanicis* (1695). His poetical works include *Fortgesetzte*

Fünffache Kirchenandachten (1716-17) and *Zugang zum Gnadenstuhle* (1705).

NEUMES, nūmz (OF. *neume*, from ML. *neuma*, *pneuma*, song, musical sign, from Gk. *πνεῦμα*, *pneuma*, breath, from *πνέω*, *pneō*, to breathe). In Gregorian music, melodic ornaments, especially series of notes sung to one syllable. Also characters in a peculiar system of musical notation which was in use from the eighth or ninth to the eleventh century. The oldest preserved manuscript written in this notation is the Antiphonary of Saint Gall (ninth century). No staff was used. The notes were represented by a system of dots and hooks and their respective pitch by the height at which they were placed above the syllables of the text. A single long note was indicated by the *virga* (), two notes on one syllable by the *biriga* ()), three by the *trivirga* ())), etc. A shorter note was indicated by the *punctus* (.), two by the *bipunctus* (..), etc. The rising and falling of the voice was marked by a corresponding higher or lower position of the signs. In order to obviate the difficulty of determining the exact pitch of the various tones, a red line was drawn horizontally across the parchment (tenth century), and the signs were written above and below this line. Any sign upon the line denoted F. Before another century a second line was drawn above the red one. This was yellow and the note upon it was C. But in the plainer manuscripts the distinction of color was soon abandoned, and two black lines were drawn with the letters F and C placed at the beginning. In the course of time these letters underwent a series of conventional modifications, until they finally assumed the shape in which they are used to-day as clef-signatures (C, F). The G clef, which was added later, underwent a similar change (G). See

MENSURABLE MUSIC; MUSICAL NOTATION; PLAIN CHANT.

NEUMÜNSTER, noi'mun-stär. A manufacturing town in the Province of Schleswig-Holstein, Prussia, on the Schwale, 36 miles north of Hamburg (Map: Prussia, D 1). The principal industrial establishments are woolen and linen mills, tanneries, paper-mills, dye-works, machine and railway shops. Population, in 1890, 17,539; in 1900, 27,335.

NEUNKIRCHEN, noin'kérk-en, or **NEUNKIRCHEN**. A town in the Austrian Crownland of Lower Austria, on a branch of the Danube, 30 miles south-southwest of Vienna. It has a large iron foundry, metal and textile industries, boiler works, and soap factories, and lies in an important coal-mining district. Population, in 1900, 10,831.

NEUQUEN, ná'oo-kán'. A territory of Argentina, situated on the western frontier of the Republic, and bounded by Chile on the west, the Province of Mendoza on the north, and the Territory of Rio Negro on the east and south (Map: Argentina, D 11). Its area is about 42,000 square miles. The greater part of the territory is covered by the ramifications of the Andes, which are drained by the headwaters of the Rio Negro. On the southern boundary is Lake Nahuel-Huapi (q.v.). The population in 1895 was 14,517, mostly Indians, though many Chileans have settled in the territory since the

Indians were subjugated in 1884. The capital is the village of Chosmalal.

NEURALGIA (Neo-Lat., from Gk. *νεῦρον*, *neuron*, nerve + *ἄλγος*, *algo*, pain). A sensory neurosis classed as functional and characterized by pain in the course of a nerve or of nerves. Neuralgias are divided into (1) symptomatic, as when they are due to a toxin or a reflex irritation, and (2) idiopathic, when developing from organic disease of the nerve at the site of the pain. But the latter are cases of neuritis in reality, and should not be classed with the neuralgias. Neuralgias are also divided into classes named from their causes, as gouty, traumatic, hysterical, etc., as well as from their anatomical location, as trigeminal, lumbar, crural, sciatic, gastric, renal, visceral, cervico-occipital, brachial, and intercostal. The trigeminal, or facial, neuralgia is the most frequent, and the sciatic ranks next in frequency.

Among the causes are anæmia, gout, rheumatism, diabetes, carious teeth, toxic agents, infections, exposure to cold, malaria, fatigue, mental shock, and injuries. Children never suffer from neuralgia. It is most frequent between the ages of fifteen and twenty-five. It is rare in old age. Women are oftener victims of neuralgia than men, in the proportion of five to three.

The most prominent symptom is pain, which is of a sharp, lancinating character, or of a dull aching variety. Generally it appears in twinges of short duration, though of great intensity. Though principally following the course of the nerves, neuralgic pain pervades adjacent structures. Heat as well as cold generally increases it, as well as a light touch. Firm pressure sometimes relieves. In many cases painful points, generally corresponding to the places of exit of nerves from a bony structure, are found by testing with pressure. Numbness may accompany the pain, as well as muscular spasm in rare cases. The pain of neuralgia is usually increased at night. It may return at regular intervals during the day, especially if dependent upon neuritis.

The treatment of neuralgia includes the use of rest, catharsis, the analgesics, hypodermic exhibition of morphia, the use of cocaine by the galvanic cathode, as well as the local use of menthol, camphor, mustard, chloride of ethyl, chloroform, etc. Excision of a part of the affected nerve or removal of a ganglion of the sympathetic may effect a cure. In all cases hygiene, diet, regimen, and tissue-building are necessary, as well as the discovery and removal of any peripheral irritant, thereby stopping all nerve leaks. See NEURITIS.

NEURASTHENIA (Neo-Lat., from Gk. *νεῦρον*, *neuron*, nerve + *ἀσθένεια*, *astheneia*, weakness), nerve weakness. Perhaps the most frequent of the acquired neuroses. The symptom group making up this clinical entity was first familiarized by Beard of New York in 1869, and it is sometimes called the American disease, though now recognized as a world-wide malady. As a rule all forms of nervous energy are reduced and fatigue quickly appears upon the exercise of any motor, mental, or organic activity. It is essentially a disorder of the productive period of life, but does occur in neurotic children and in nervous adults of advanced years. The sexes are about equally affected. Hebrews, Scandinavians,

and Slavs show a special susceptibility, and those of neuropathic heredity and the offspring of the physically defective are prone to develop it.

High altitudes, extremes of climatic conditions, wasting diseases, vicious habits, physical illness, injury, shock, and fright, or protracted anxiety, grief, worry, and excitement are competent causes. Excesses of all varieties, and finally and most important of all, overwork, must be added to the list. The only essential element in the causation of neurasthenia is overstrain, and this is a quantity relative to the inherent capacities of the individual and often correlated with hereditary tendencies or defects.

The major symptoms of the disorder are headache, backache, gastro-intestinal disturbances, neuro-muscular weakness, mental depression, irritability, and insomnia. To these in varying number and of inconstant appearance are added tremor, twitches, startings, sensations of general fatigue, pressure headaches, drawing feelings in the back of the neck and spine, tenderness at various points along the spine, particularly at its two extremities and at the waist, neuralgic pains, and various paræsthesiæ described as prickling, tightness, burning, numbness, stiffness, heat, cold, heaviness, soreness, and vague discomforts referred to the body viscera. Use of the eyes commonly intensifies the headache, and causes prompt fatigue with increase in all the subjective complaints. Sometimes patients shun the light continuously. Nervous indigestion, gaseous fermentation, alternating diarrhœa and constipation, cardiac palpitation, feebleness of the circulation, and vascular storms are commonly presented. The activity of the functions of the genito-urinary tract is reduced. On the mental side there is loss of concentration and consequently memory is enfeebled. Continuous application is impossible. Courage fails, introspection becomes habitual, and many apprehensions and distinct phobias of a hypochondriacal cast add to the patient's misery. The natural affections are diminished and depressed emotions are continuous. The sleep, disturbed by troubled dreams, is broken and unrefreshing. The early morning hours are particularly gloomy. The patient's general bodily condition is unsatisfactory. Anæmia and loss of flesh are commonly encountered, though exceptionally the general nutrition is excellent. The great majority of these symptoms it will be noticed are subjective, not demonstrable physically and capable of misrepresentation. For this reason such patients are misunderstood by their friends, who either foster the condition by misguided solicitude or give it scant sympathy. A careful examination proves that the nerve force is actually diminished and strength exhausted with undue ease. This is demonstrated by the contraction of the visual fields under appropriate tests, the initial exaggeration and progressive reduction of the tendon reflexes, the inability to maintain dynamographic records, the tendency to rapid heart, the digestive inadequacy, etc. Any one or even very many of the enumerated symptoms may be found in other ailments, but it is their systematic grouping and the exclusion of other competent morbid states that enables a diagnosis of neurasthenia to be made.

When the brain functions are principally disordered the term cerebral neurasthenia is some-

times employed. In the same way spinal and sexual neurasthenia are mentioned, but in neurasthenia no function escapes, though there may be a varying preponderance of certain classes of symptoms. All functions are marked by an irritable weakness. Often this nervous disorder is associated with hysteria, particularly in the traumatic cases. Not seldom it is secondary to an initial bodily disease, which may or may not be present at the same time.

Neurasthenia is essentially chronic. Its causation is commonly of long standing, its onset insidious, its course protracted, its recession halting and marked by relapses, its tendency to recurrence pronounced. It is often associated with organic and inorganic diseases, and is encountered as an initial stage in the development of hypochondriasis, melancholia, mania, and general paresis. When uncomplicated by organic diseases its prognosis is usually fairly good, provided the causal conditions can be removed and sufficient adequate rest and upbuilding secured. As it often arises out of the necessities of human existence and social conditions, its proper treatment is frequently impossible. The keynote is rest, and in proportion as this can be made complete both mentally and physically success results. The full rest cure plan of Mitchell, especially with women, often secures brilliant results. In a modified form in mild cases it is also efficient. It implies the expenditure of much time and money. When this is not possible, change of scene, of occupation, of preëxisting influences must otherwise be obtained. The burden of work, the fretting, and carking cares must be minimized, and the physical health and stamina raised to the highest possible level. If such patients can be fattened success is almost assured. Drugs play an entirely secondary part in the treatment of neurasthenia, merely meeting incidental physical requirements. Any underlying physical disease of which neurasthenia may be the superficial manifestation must of course receive major care. To the mental perturbation, however, constant attention must be directed. The patient's fears must be allayed, his hopefulness encouraged, his introspection diverted, and refreshing sleep secured. In proportion as the physician grasps the mental side of the disease, secures the patient's confidence, and meets the requirements of his biased views, in that ratio is he successful and helpful in managing the neurosis.

A number of more or less speculative theories regarding the essence of neurasthenia are current. Hodge and others have proven by interesting laboratory experiments that under conditions of ordinary use the protoplasm of the motor cells is morphologically modified and probably more or less exhausted functionally; that during rest and repose it regains its former appearance and potential force. Some conceive that in neurasthenia the rest periods have been so inadequate that the recuperative powers are belittled, and there is reason to suppose that in some instances this may reach an irreparable degenerative degree. Certain alleged peculiarities of the blood and the general disturbance of assimilation are looked upon by others as arguing a general toxic state which gives rise to the neurasthenic manifestations. These findings are as likely to be effect as cause, but doubtless might operate in a vicious circle to protract the nervous disorder.

NEUREUTHER, noi'roi-tär, EUGEN NAPOLEON (1806-82). A German painter, etcher, and illustrator, born in Munich, son of the painter Ludwig Neureuther (1776-1830), by whom he was first instructed at Bamberg, before studying at the Munich Academy under Wilhelm von Kobell. His talent developed, however, chiefly under the influence of Cornelius, who employed him on the frescoes in the Glyptothek and in the Arcades of the Royal Garden. His success in this work of ornamental character suggested to him the idea of illustrating Goethe's romances and ballads with marginal drawings. Published in 1829-39, the drawings were universally admired and made the artist's reputation. In 1830 Neureuther visited Paris, where his illustrations of the scenes of the July Revolution appeared under the title "Souvenir du 27, 28, 29 juillet" (1831). After his return, he published "Marginal Drawings to German Poets" (1832-35), and in 1838 completed his illustrations to Herder's *Cid*. From a visit to Rome in the same year he returned with a rich collection of studies, utilized subsequently in various works. In 1835 he had first tried his hand at etching, in which line he produced his most pleasing and valuable compositions, notably the large plate of "Dornröschen" (1839), his best effort with the needle. As a painter he may be judged by the fine specimens in the Schack Gallery at Munich, which contains "Cornelius Among His Pupils and Fellow Artists," "The Dying Nun," and others.

NEUREUTHER, GOTTFRIED VON (1811-87). A German architect, born at Mannheim, brother of Eugen Neureuther. First instructed by his father, he studied afterwards in Munich at the university and academy, and extended his knowledge by traveling through Germany, France, Italy (which he visited four times), Greece, and Turkey. He became most widely known through the Polytechnicum (1866-70) and the new Academy of Arts (1873-85) in Munich, handsome edifices in the Italian Renaissance style, of which he was a prominent exponent.

NEURITIS (Neo-Lat., from Gk. *νεῦρον*, *neuron*, nerve). A disease of a nerve or of nerves, accompanied by inflammation. Neuritis is either single or multiple; interstitial or diffuse; toxic or infective. It is caused by injury to the nerve involved, or infection such as from typhoid fever, or tuberculosis or leprosy; or by toxic action of alcohol, arsenic, lead, etc.

The symptoms of localized neuritis are severe pain, somewhat relieved when the part is at rest and kept warm, some numbness, reduction of the sense of touch, loss of power in the muscles, and eventual atrophy. There may be some contracting of the muscles, with rosy color of the skin, and a peculiar glossiness.

Multiple neuritis is very frequent. It is caused by the toxins of several infectious diseases, as diphtheria, typhoid fever, smallpox, and scarlet fever, as well as those of alcohol, mercury, lead, gout, diabetes, cancer, and tuberculosis. In this form of neuritis the invasion is usually acute, with fever, pain in head, back, and legs, loss of power in arms and legs so that the patient can scarcely climb the stairs, drop-wrist and drop-foot, muscular wasting, tenderness in the muscles, tremor, and sensory disturbances. Fever is rare, and the invasion of the disease is slow. When alcohol is the cause, delirium and convul-

sions may occur, with hallucinations, somewhat resembling *delirium tremens*. Multiple neuritis is very frequent in other countries, under various names. It is called *beri-beri* or *kaké* in Japan, China, New Zealand, India, Brazil, and the West Indies, in which countries it is endemic. Its course is similar to that of alcoholic multiple neuritis. Its mortality varies from 3 to 50 per cent. The mortality of alcoholic neuritis is not much smaller. Of those who continue the use of alcohol, 50 per cent. die of alcoholism, pneumonia, or tuberculosis. The treatment of multiple neuritis consists of elimination of the cause, rest in bed, phenacetin, sodium salicylate, strychnia, nitrate of silver, and chloride of ammonium under a physician's directions.

NEUROLOGY (from Gk. *νεῦρον*, *neuron*, nerve + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The branch of science concerned with the anatomy, physiology, disorders, and diseases of the nervous system. Brain functions associated with mentality are somewhat arbitrarily placed in the field of psychology, and their disorders furnish the topics grouped under the head of psychiatry. Neurological conditions are also studied in the lower animals, giving a subdivision of the subject, comparative neurology, which with embryology furnishes important facts which aid in understanding the human nervous apparatus. In the more limited medical sense, neurology embraces a study of the human nervous system, its diseases (except insanities) and their treatment.

Nervous diseases are: first, morbid manifestations of demonstrably disturbed nerve elements, and, second, so-called functional disorders in which actual changes in the physical properties of the nervous system have not yet been discovered. The latter are commonly called *neuroses* and are steadily tending to enter the former category under improved methods of research. In many nervous diseases heredity is a marked feature and in the acquired diseases of the nervous system heredity may play a predisposing part.

There is a general and probably well-founded belief that nervous diseases are increasing in frequency. Absolute statements, however, are impossible, as many causative conditions are changing and other newly recognized nervous diseases are being added to the known list. For instance, the infectious diseases, such as smallpox, typhoid, diphtheria, and malaria, are all capable of producing organic and functional nervous diseases. Their control by preventive medicine and hygiene correspondingly reduces that liability. Civilization, on the other hand, by conserving the unfit and prolonging the life of the feeble and neurotic, entails additional nervous disturbances and susceptibilities. There can be no doubt that modern urban conditions favor the development of nervous instability and at the same time bring to bear the additional highly competent noxious influences of vice, particularly through alcoholic and drug habits and venereal diseases. The monotony and hardships of farm life, however, are also a factor of morbidity and are particularly active among the women so situated. Some occupations bear either a direct or predisposing relation to nervous ailments. Writer's cramp and the entire group of occupation neuroses of which it is a type show this

feature. Workers in metal, especially lead, phosphorus, mercury, arsenic, those subjected to inhalation of various gases, and those whose occupation tempts them to indulge in liquors, are liable to nervous disorders. Work entailing exposure to cold or wet or increased atmospheric pressure, and that attended by great mental strain or monotony, furnishes predisposing factors.

The question of heredity in relation to nervous diseases is one of decided importance. The neurologist is not content to trace the identical nervous disorder in successive generations, or to note its appearance in blood relations. He properly concerns himself with all the facts which tend to furnish a neuropathic liability. This is indicated with more or less force by the occurrence of any sort of nervous and mental disease in the antecedents of a given individual. An hysterical mother may have an epileptic child and an idiotic grandchild. Even a very highly wrought nervous organization in mother and father may eventuate in unstable children. The transmission of nervous disease may be direct, the identical malady reappearing, or, what is more common, the defect may show itself by transformation into some allied malady. Atavistic tendencies, through which an intermediate generation escapes, are also frequently noted. Tuberculosis, rheumatism, gout, diabetes, and Bright's disease are so commonly found in neurotic families that the association is morbidly significant. All debilitating diseases and exhausting conditions in parents may be reflected in nervously unstable offspring. Consanguinity in the parents does not operate detrimentally as far as nervous diseases are concerned, unless, as is often the case, it brings together individuals of neurotic tendencies, which are naturally intensified in the children.

NEUROPTERA (Neo-Lat. nom. pl., from Gk. *νεῦρον*, *neuron*, nerve + *πτερόν*, *pteron*, wing). A Linnaean order of insects which has recently been restricted by separating out the orders Mecoptera, Corrodentia, Isoptera, Odonata, Ephemerida, Plecoptera, and Trichoptera, which together for a time were known as the Pseudoneuroptera. At present the Neuroptera includes those forms belonging to the old group of net-winged insects which possess a complete metamorphosis. The mouth-parts are formed for biting; the wings are four in number, membranous, and furnished with numerous veins, usually with many cross veins. Practically all forms are carnivorous, and feed upon other insects. Some of them are aquatic, but the majority live on land and wherever their prey abounds. The order is divided into seven large families:

(1) The Sialidæ, including the dobson or hellgrammite fly (see *CORYDALIS*), the alder-flies (*Sialis*), and the fish-flies (*Chauliodes*).

(2) The Raphidiidæ, or snake-flies (q.v.).

(3) The Mantispidæ, including the false rear-horses, or mantis-like Neuroptera. These insects, rare in the United States, have a long neck and grasping front legs, and are predatory in habits; their transformations are especially interesting.

(4) The Conoptrygidæ, including the dusty-wings, which are the smallest of the Neuroptera and have wings covered with whitish powder. They are very few in number, and prey, in the larval stage, upon scale insects, plant-lice, and red spiders.

(5) The Myrmeleonidæ, or ant-lions (q.v.).

(6) The Hemerobiidæ, or aphid-lions (q.v.).

(7) The Chrysopidæ, or golden-eyed lace-winged flies. See *LACEWING*.

Nearly all the families of Neuropteran insects are represented by fossil remains in the Tertiary rocks; and some, such as the dragon-flies, caddice-flies, May-flies, and white ants, appear in the still earlier Mesozoic formations.

Consult: Comstock, *Manual for the Study of Insects* (Ithaca, 1895); Sharp, *Cambridge Natural History*, vol. v. (London, 1895); Howard, *The Insect Book* (New York, 1902).

NEUROPTERIS (Neo-Lat., from Gk. *νεῦρον*, *neuron*, nerve + *πτερίς*, *ptēris*, fern). An important genus of fossil ferns common in the coal measure shales and sandstones of Carboniferous age in North America and Europe. See *FERN*; and *CARBONIFEROUS SYSTEM*.

NEUROSIS (Neo-Lat., from Gk. *νεῦρον*, *neuron*, nerve). A morbid nervous state, either functional (due to reflex disturbance from a lesion or a condition in another part of the body) or organic (due to local conditions). Neuroses are classed as *kinesio-neuroses*, or disorders of motion; *æsthesio-neuroses*, or sensory disorders; *tropho-neuroses*, or disorders of nutrition; *thermo-neuroses*, or disorders of heat perception; *vasomotor neuroses* or *angio-neuroses*, or disorders of circulation; *secretory neuroses*; and *mixed neuroses*. Among the latter are the *acro-neuroses*, certain disorders affecting the extremities, such as *acro-paræsthesia* and *erythromelalgia*; *sexual neuroses*, affecting the functions of the sexual organs; and *psycho-neuroses*, in which there is a combination of mental and physical symptoms due to a complex condition. Dana classifies conveniently the functional nervous diseases that are termed neuroses as follows: (1) Degenerative neuroses, including epilepsy, hysteria, the spasmodic tics, paramyoclonus, Thomsen's disease, paramyotonia, and akinesia algera. (2) Acquired neuroses, including chorea, tetanus, tetany, neurasthenia, sexual neuroses, traumatic neuroses, exophthalmic goitre, and the occupation neuroses. (3) Late degenerative neuroses, including paralysis agitans. (4) Trophic and vasomotor neuroses, including facial hemiatrophy, acromegaly, and angioneurotic œdema. Many of these functional neuroses are considered under their proper titles.

The occupation neuroses are functional disorders consisting of numbness, tingling, partial loss of muscular power, involuntary contractions or spasms, tremor and disability, which combine to prevent the use of certain groups of muscles which have been used habitually by the patient in his occupation or professional labors. An occupation neurosis is really a condition of muscle-fatigue occurring in a neurasthenic, with subsequent neuritis in a few cases. The most common neurosis of this class is *writers' cramp*, or *scriveners' palsy*. This disease has been known since about 1820, when the steel pen superseded the quill. Men, aged about twenty-five to forty years, are the most numerous victims. Worry, intemperance, and other undermining influences are predisposing causes, as well as preëxisting neurasthenia, as already noted. Excessive writing, under mental pressure, is the exciting cause, especially if the writing is done with the hand in a cramped position. It is a chronic disease. Many sufferers learn to

write with the left hand, but this also soon becomes affected. The use of gold pens has brought some relief, and has controlled the increase of the affection among writers. But the great refuge and preventive is the typewriter. All who use the pen to a great extent should use large cork penholders and gold pens. Writing under cerebral strain should be avoided.

Telegraphers' cramp is frequent among the manipulators of the Morse instrument. About one in 200 operators suffer from 'loss of the grip.' The symptoms are much the same as in writers' cramp. Among the other occupation neuroses are *musicians' cramp*, among pianists, violinists, flutists, and others; *sewing spasm*, among tailors, seamstresses, and shoemakers; *milkers' spasm*, which is very rare; *ball-dancers' cramp*, and many others.

In the treatment of occupation neuroses, rest or change of occupation, massage of nerve and muscle, electricity, douches, and the cautery have proved useful. Drugs are generally useless, except such as relieve the neurasthenia of the patient. Consult Dana, *Text-book of Nervous Diseases* (New York, 1892).

NEUROTIC (Neo-Lat. *neuroticum*, from *neurosis*). A word formerly used in medicine to specify such a drug as tends to affect principally and specifically the brain centres that govern intellect, sensibility, and motor activity. Alcohol, ether, chloral, opium, potassium bromide, amyl-nitrite, strychnine, quinine, aconite, and digitalis are examples of drugs to which this name may be applied.

The term neurotics is more often used to denote individuals who suffer from nervous disease, such as neurasthenia or hysteria, or who are of pronounced nervous temperament.

NEURUPPIN, noi'rup-pén'. A town of the Province of Brandenburg, Prussia, on the small lake of Ruppín, connected with the Elbe, 38 miles northwest of Berlin (Map: Prussia, E 2). It has a gymnasium and a seminary for teachers. Its industries are brewing, spinning, and the manufacture of linen and woolen cloths, starch, brushes, machinery, and trimmed lumber. There is also considerable trade in cattle and cereals. Neuruppin became a town in 1256. Population, in 1890, 14,584; in 1900, 17,100.

NEUSALZ, noi'záls. A town in the Province of Silesia, Prussia, on the Oder, 75 miles northwest of Breslau (Map: Prussia, F 3). The principal industries are flax-spinning, iron-working, shipbuilding, and the manufacture of linen thread, cartridges, and enamel. Population, in 1900, 12,586.

NEU-SANDEC, noi-zán'déts. A town of the Crownland of Galicia, Austria, situated on the Dunajec, about 45 miles southeast of Cracow (Map: Austria, G 2). It has a Roman Catholic church of the fifteenth century, an Evangelical church of the seventeenth century, an old castle, a gymnasium, a Jesuit college, and a hospital. The chief industrial establishments are the extensive railway shops, and in the vicinity of the town are petroleum wells. Population, in 1890, 12,722; in 1900, 15,724, mostly Poles and Jews.

NEUSATZ, noi'záts (Hung. *Újvidék*). A royal free town of Hungary, situated on the left bank of the Danube opposite the town of Peterwardein and at the mouth of the Franz-Josefs Canal (Map: Hungary, F 4). It is a town of

recent origin, having been practically rebuilt since its destruction in 1849. It is the seat of the Greek Oriental Bishop of Bács, and has a higher gymnasium and a commercial school. Its products are chiefly agricultural, and the river trade is important. Neusatz is the seat of the *Matica Srpska*, the chief literary and scientific organization of the Serbs in Southern Hungary. Population, in 1900, 29,296, mostly Serbs and Magyars.

NEUSE, nūs. A river of North Carolina, rising in Person County in the northern part of the State, and flowing southeast into Pamlico Sound (Map: North Carolina, F 3). It is about 300 miles long, and navigable by steamers for over 100 miles. At Newbern, 30 miles from its mouth, it widens into a broad estuary.

NEUSIEDLER SEE, noi'zéd-lër zä (Hung. *Fertő-Tava*). A lake in Northwestern Hungary, 30 miles southeast of Vienna (Map: Hungary, E 3). It is about 23 miles long, from 4 to 9 miles wide, and covers an area of 126 square miles. On the eastern shore is the large swamp of Hanság, but the land on the west shore consists of vine-clad hills, with several thriving towns. The water is salty, and unfit to drink. The lake has dried up on several occasions, notably in 1865, when farms were laid out in its bed; but in 1870 it filled up again, destroying all improvements. It is now connected with the Rábnitz River by a canal which, in case of a flood, drains off the surplus water.

NEUSOHL, noi'zól (Hung. *Besztercebánya*). The capital of the Province of Sohl, Hungary, at the confluence of the Gran and Bistritz, 13½ miles by rail north of Altsohl (Map: Austria-Hungary, F 2). It has a cathedral noted for its fine fourteenth-century altar, besides other interesting ecclesiastical structures. The old castle is used as a garrison station. There are manufactures of hardware, firearms, and a silver foundry. Four and a half miles to the north are the Herregrund silver and copper mines. Population, in 1900, 9264.

NEUSS, nois. A town in the Rhine Province, Prussia, near the Rhine, with which it is connected by a canal, 4 miles west of Düsseldorf (Map: Prussia, B 3). The Catholic Church of Saint Quirinus, a beautiful edifice, and a noble specimen of the transition from the round to the pointed style, was begun in 1209. The late Gothic Rathaus is interesting for its collection of paintings by Janasen. Neuss produces a large amount of rape oil. There are manufactures of paper, machinery, ironware, leather, and woolens; there is a trade in grain, cattle, and coal. Population, in 1890, 22,635; in 1900, 28,484. The town is supposed to be the *Novesium* of the Romans. It came under the Archbishop of Cologne in 1074. In 1474 it suffered a long siege by Charles the Bold, and a century later was almost totally destroyed by Alexander of Parma.

NEUSTADT, noi'stát. A city in Upper Silesia, Prussia, 29 miles southwest of Oppeln (Map: Prussia, G 3). It has two monasteries, a gymnasium, and several trade schools. There are manufactures of woolen and linen fabrics, carpets, shoes, dyes, and yeast. Population, in 1890, 17,577; in 1900, 20,139.

NEUSTADT, WIENER. A town of Austria. See WIENER-NEUSTADT.

NEUSTADT-ON-THE-HARDT, härt. A town in the Rhine-Palatinate, Bavaria, situated in the Hardt Mountains, about 15 miles west-northwest of Speyer (Map: Bavaria, C 4). The abbey church (1356) contains a number of tombs of the Counts Palatine. The educational institutions include a gymnasium, a *Realschule*, and a Latin school founded in 1579. Neustadt manufactures cloth, paper, tobacco, etc. In the vicinity are extensive vineyards. Population, in 1890, 15,016; in 1900, 17,800, chiefly Protestants.

NEUSTETTIN, noi'stët-tän'. The capital of a circle in the Province of Pomerania, Prussia, 92 miles southwest of Danzig (Map: Prussia, G 2). There are manufactures of machinery, ironware, and dyes. Population, in 1900, 10,026.

NEUSTRELITZ, noi-strä'lits. The capital of the Grand Duchy of Mecklenburg-Strelitz, Germany, situated 62 miles by rail north by west of Berlin (Map: Germany, E 2). It is laid out with remarkable regularity, its wide, straight streets radiating in eight directions from the market-place, which is adorned with a statue of the Grand Duke George. The principal buildings are the grand ducal palace, situated in a beautiful park and containing a fine library of 80,000 volumes and collections, the theatre, and the Rathaus. There are also a gymnasium, a *Realschule*, and a fine hospital. The principal manufactures are machinery, woollens, trimmed lumber, cloth, vinegar, flour, etc. The trade is mostly in agricultural products and flour. Neustrelitz was built in 1726 on the site of an old fortress. Population, in 1900, 11,344.

NEUSTRIA, nüs'tri-ä (Lat. *Francia occidentalis*, West France). The name given in the times of the Merovingians to the western portion of the Frankish Empire, in contrast to Austrasia (q.v.). Later it was used for various territorial divisions; in the eleventh century, and later, it was often used as synonymous with Normandy. Consult Longnon, *Atlas historique de la France* (Paris, 1889). See FRANKS.

NEUTITSCHEN, noi'tit-shin. A town in the Crownland of Moravia, Austria, on the Titsch, 70 miles northeast of Brunn (Map: Austria, F 2). It has a Byzantine church and an old castle, a higher *Realschule*, and schools of agriculture and forestry. There are manufactures of tobacco, carriages, hats, and cloth. Population, in 1900, 11,891, chiefly of German descent.

NEUTRAL AXIS (Lat. *neutralis*, from *neuter*, neuter, from *ne-*, not + *uter*, either). An imaginary line of a body which is subjected to a transverse strain, and is so situated as to separate the forces of extension from those of compression. If the ratio of the resistance to extension and compression were the same for all substances, and depended merely upon the form of the body, then in all bodies of the same shape the neutral axis would have a definite geometric position. But this ratio has a separate value for every substance. In a rectangular wooden beam supported at both ends, the neutral axis passes longitudinally through the centre of the beam, while in cast iron, in which the resistance to compression is greater than that to extension, it is a little above the centre, and in wrought iron, in which the contrary is the case, it is a little below the centre.

NEUTRALITY (in International Law). The complete abstention of a State from giving material aid or encouragement to either belligerent in an existing war. Legally a neutral State is a friend to both belligerents and endeavors to maintain peaceful relations with each. The doctrine of neutrality as now understood is of comparatively recent growth, it having had almost no place in the rules of ancient warfare. As a result of the imperfect notions of neutral duty, several grades of neutrality were formerly recognized. Thus, the obligation of neutrality might be qualified by a previous agreement with one of the belligerents by which the neutral stipulated to furnish troops or ships of war or other material upon the outbreak of hostilities. Such a position would be regarded as an act of war according to modern international law, which recognizes only *strict* neutrality—that is, total abstinence from participation in the war either by assistance or countenance. The status of *permanent* neutrality may be created by the agreement of a State to observe perpetual neutrality toward certain other States in consideration of having its own neutrality respected, or the neutrality of a State may be guaranteed by the collective action of other nations. Such is the position of Switzerland and Belgium. The status of *armed* neutrality arises from the alliance of several neutral powers for the purpose of maintaining certain views of neutral duty or for preventing the armed aggression of a belligerent upon neutral commerce. Such were the armed neutralities of the Baltic Powers formed in 1780 (see ARMED NEUTRALITY, THE) and 1800 for enforcing the doctrine that "free ships make free goods" which the Powers concerned had adopted by treaties among themselves. It is the usual custom upon the outbreak of war for neutral governments to issue proclamations of neutrality, announcing the course which they purpose to follow in their intercourse with belligerents during the continuance of hostilities, sometimes giving notice to belligerents of what will be permitted and what forbidden in neutral waters, and formally notifying their own subjects or citizens of the existence of war and warning them of the penalties imposed for the violation of its neutrality laws. As the doctrine of neutrality is now understood it is the duty of neutrals to treat both belligerents as friends, neither granting nor withholding any privilege from one which is not granted or withheld equally from the other. Any deviation from this rule which results in an injury to one of the belligerents is a clear violation of neutral obligations and may be a justification for reprisal on the part of the injured belligerent. Among the positive obligations of a neutral may be mentioned the duty of treating the soldiers of each belligerent humanely, as where a ship of war in distress seeks to enter a neutral port or fugitive troops ask for asylum from the pursuit of a victorious army. Among the obligations of a negative character resting upon neutrals may be mentioned the duty of abstaining from furnishing money, ships, troops, or munitions to either belligerent. However, it is legitimate for neutrals in their own country to sell to belligerents whatever they may wish to buy so long as both are treated equally. So, too, they may transport any article of commerce, except contraband of war, to belligerent ports for the purpose of sale unless with the intention of violating a blockade. But

it is forbidden to neutrals to allow their ports or territorial waters to be used by either belligerent as a base of hostile operations against the other.

Not only are neutrals subject to certain duties, but international law clothes them with certain rights and immunities which belligerents are bound to respect. Thus a neutral State has a right to insist that its territory shall be inviolable from acts of war committed by either belligerent. An armed vessel, therefore, has no right to pursue an enemy into neutral waters or to effect a capture there. Nor has a belligerent any right to move troops through the territory of a neutral State or commit acts of belligerency therein. These are violations of the sovereignty of the neutral and may be resisted by force. The act of a public vessel, however, in passing through the territorial waters of a neutral State is not a violation of its neutrality.

As a means of enforcing the obligations of neutrality it is customary for States to pass statutes defining the duty of their subjects in relation to other nations at war and imposing penalties for their violation. These statutes are popularly known as *neutrality laws*. They do not affect the international responsibility of the State, however, and their inefficiency cannot be pleaded in extenuation of a failure to fulfill neutral obligations.

The neutrality laws of the United States are contained chiefly in the acts of 1794, 1818, and 1838. They declare it to be a misdemeanor for any citizen to accept or exercise a commission for the purpose of serving a foreign Power in war with a State at peace with the United States, or to enlist or induce another person to enlist or engage him to go abroad to enlist in the foreign service of such a State; or to fit out, arm, equip, or augment the force of any armed vessel with the intent that it shall be employed in the service of a Power at war with a friendly State; or to institute within the territory of the United States any military expedition against any such Power. The President of the United States is empowered to compel any foreign vessel which ought not to remain in the territorial waters of the United States to depart therefrom and to enforce the observance of the neutrality laws in general. One of the chief purposes of this legislation is to prevent organized efforts to secure the enlistment of troops by belligerents in neutral territory. Neutral governments, however, cannot be held responsible for the unorganized and unauthorized departure of individual citizens for the purpose of enlisting in a foreign army. The manufacture and sale of contraband of war except in the case of ships fitted for warfare is not expressly prohibited by the neutrality laws of either Great Britain or the United States. See INTERNATIONAL LAW, and the authorities there cited; also ALABAMA CLAIMS; CONTRABAND OF WAR; DECLARATION OF PARIS; WAR.

NEUTRAL NATION. An Iroquoian tribe formerly holding the territory along the north shore of Lake Erie in the Province of Ontario, and extending eastward as far as the Genesee River in New York. Their proper name is unknown. They were known to the Huron (see WYANDOT) as *Atiwendaron*, implying a people speaking a language slightly different (from Huron), and to the Seneca as *Gagwage-ono*. The

French called them the 'Neutral Nation,' on account of their taking a neutral stand during the long wars between the Iroquois and the Huron. This did not save them, however, for on the final conquest and dispersion of the Huron people the Iroquois invaded the Neutral country with the result that in 1651 the tribe was utterly destroyed, the remnant being incorporated with the conquerors or dispersed in small parties among the Western or Southern tribes. The war was carried on chiefly by the Seneca, according to whose tradition the immediate cause of dispute was a ball-play contest in which the Seneca were the victors. The final battle occurred at a fortified Neutral town about six miles south of the present Buffalo. The majority of the captives were incorporated by the Seneca, who also took possession of the conquered territory as far west as Lake Erie.

NEUVILLE, né'vél', ALPHONSE DE (1836-85). A French military painter and illustrator. He was born at Saint-Omer (Pas-de-Calais), May 31, 1836. His father, who was wealthy, wished his son to prepare for an official position, but the boy preferred a military life and attended the naval school at Lorient, where he spent much time sketching. To please his family, he studied law for three years, but then determined to become a painter. He took a studio of his own, studying a short time with Picot, but was more influenced by the art and advice of Delacroix. His first exhibited picture, "Batterie Gervais, Malakoff," an episode from the Crimean War, achieved some success. Not being equally successful with later works, as a means of livelihood, De Neuville designed a large number of illustrations for periodicals and books. His great success came after the Franco-Prussian war of 1870-71, in which he served as an officer of engineers. He became the most popular painter of that war, his pictures being greeted with great applause. From a purely artistic point of view they are open to criticism. His colors are often dull, and sometimes ill-chosen, wherefore his drawings in black and white are considered better than his paintings. He excels in portraying vividly and vigorously an intensely dramatic incident, and depicts soldiers in the thick of the fight with accuracy and sentiment that make the pictures national in spirit.

His early paintings include: "Capture of Naples by Garibaldi" (1860); "Chasseurs of the Guard" (1861); and "Attack in the Streets at Magenta" (1864)—all in the Saint-Omer Museum; "Chasseurs Crossing the Tchernaiia" (1868), Lille Museum. Among his later and more famous pictures, many of which are in the United States, are: "Bivouac Before Le Bourget" (1872), Dijon Museum; "The Last Cartridge" (1873); "Defense of Le Bourget" (1879), and "Surprise in Environs of Metz in 1870" (1877), in the W. H. Vanderbilt collection, New York; "The Adieu," John Jacob Astor, New York; "Attack at Dawn," John G. Johnson, Philadelphia, Pa.; "The Destruction of the Telegraph Line" (1884), David C. Lyall, New York. In 1881 he, in company with Detaille, painted the celebrated circular panorama, "The Battle of Champigny." He died in Paris, May 20, 1885. Consult De Lostalot, in *Gazette des Beaux-Arts*, xxiv. (1885).

NEUVILLE, JEAN GUILLAUME, Baron Hyde de (1776-1857). A French statesman, born at

La Charité-sur-Loire. He displayed great loyalty to Louis XVI. and Marie Antoinette, was one of the most active agents in the 'emigration' from France, took part in the Royalist uprising of 1796, and after the 18th Brumaire attempted to persuade Bonaparte to recall the Bourbons. Being accused of having taken a part in the plot of the 'infernal machine,' he fled to Switzerland, and later went to the United States. Upon the restoration of the Bourbons, he returned to France, was Minister to the United States from 1816 to 1821, and was then Minister to Portugal. He was a member of the Chamber of Deputies from 1822 to 1830, and held the portfolio of the Marine in the Ministry of Martignac. After the Revolution of July, 1830, he withdrew into private life. His *Mémoires* were published in 1888.

NEUWIED, noi'vêt. The capital of a circle in the Rhine Province, Prussia, on the Rhine, seven miles northwest of Coblenz (Map: Prussia, B 3). The castle, residence of the Prince of Wied, stands in a beautiful park, and has collections of Roman antiquities. The town has many educational institutions, including a gymnasium and two seminaries for teachers. Wool and cotton goods, soap, tobacco, starch, chicory, and ironware are manufactured. Population, in 1900, 11,003. Neuwied was founded in 1653 by the Prince of Wied, as a refuge for religious exiles, and many religious denominations are represented by its present inhabitants.

NEVA, nè'vâ, *Russ. pron. nyè-vâ'*. The outlet of Lake Ladoga (q.v.) in Northwestern Russia (Map: Russia, D 2). It leaves the lake at its southwestern end and flows westward for 45 miles, emptying through several mouths into the Gulf of Finland. The city of Saint Petersburg is built on the islands of its delta. It is the last link in the great waterway which through the Volga River and the Ladoga Canal system connects the Caspian Sea with the Baltic. Though the volume of water flowing through the Neva is very great, and the river is in places more than half a mile wide, its navigation has been made possible only by extensive engineering works, and an artificial channel, running through the shallow Bay of Neva, connects its mouth with the harbor of Kronstadt. During continued west winds the waters of the bay are piled up in the delta of the river, causing destructive inundations.

NEVADA, nè-vâ'dâ, popularly the 'Sagebrush State.' A Western State of the United States. The 42d parallel of north latitude separates it from Oregon and Idaho on the north, the 114th meridian west of Greenwich from Utah and Arizona on the east, the Arizona boundary being continued on the southeast by the Colorado River as far as the 35th parallel, while a straight line running from the latter point northwest to Lake Tahoe in latitude 39° N., and thence along the 120th meridian, separates Nevada from California on the southwest and west. Nevada ranks fourth in size among the States of the Union. It has an extreme length from north to south of 483 miles, and an extreme breadth of 320 miles. Its area is 110,700 square miles, of which 960 square miles consist of water.

TOPOGRAPHY. The greater part of Nevada lies in the Great American Basin included between the Sierra Nevada on the west and the Wahsatch Mountains on the east, and bounded by cross

ranges on the southwest and, less definitely, on the north. Neither of the main boundary ranges comes within this State, the crest of the Sierra lying wholly in California, and the Wahsatch running through the centre of Utah. This great basin forms a plateau whose floor lies 4000 to 6000 feet above the sea, though in the extreme southwest it is somewhat lower. From this floor rise a uniform series of parallel ranges from 10 to 25 miles apart, and running north and south through the length of the State, but broken here and there by passes and branch valleys. In the southwestern portion they are almost worn away, leaving isolated knobs scattered over the plain. Some of these ranges rise above 9000 feet, while most of them are over 7000 feet high. The highest point in the State is Wheeler Peak, near the centre of the eastern boundary, with an altitude of 13,058 feet.

HYDROGRAPHY. Since the surface of Nevada is a basin surrounded by mountains, a very small part of it drains into the ocean. In the extreme north rises the Owyhee, a tributary of the Columbia River system, and the extreme southeastern portion drains into the Colorado, which flows on the southeastern boundary. A large part of the State, especially the south-central and southwestern portion, is without any rivers at all, the small streams running down the mountain slopes during the wet season being lost in the plains where the water evaporates. The principal river is the Humboldt, which rises in the northeastern corner and flows across the State to Humboldt Lake or Sink. Several rivers rise in the Sierra Nevada and flow into lakes and sinks in the west-central part of the State. Among these are Walker River, flowing into Walker Lake, Carson River, disappearing in Carson Sink, and the Truckee River, flowing from Lake Tahoe into Pyramid Lake. The last is the largest lake in the State and measures 35 miles in length by 10 miles in width. Lake Tahoe lies on the western boundary at an altitude of over 6000 feet. It is 21 miles long and 11 miles wide and of great depth. In the rainy season some of the level plains are covered for hundreds of square miles with water from a few inches to two feet deep, leaving in the dry season hardened mud flats sometimes covered with a coating of alkaline salts.

CLIMATE. The climate is very dry and in general pleasant and healthful. The winters are not severe, and snow is confined chiefly to the mountains, where in some places it remains throughout the year. The mean temperature for January is 28°, and for July 71°. The maximum may rise above 110° and the minimum is about 30° below zero, though in the valleys it seldom falls more than 16° below. The winters are generally calm; violent winds are rare at any season. The average annual rainfall is about ten inches. This is very unevenly distributed both in regard to season and locality. Five-sixths of the total precipitation falls from December to May, and the greater part of it falls in high altitudes, the mountainous parts of Washoe County receiving 23 inches, while some valley districts are absolutely rainless.

For Flora and Fauna, see paragraphs on these topics under **ROCKY MOUNTAINS** and **UNITED STATES**.

GEOLOGY. The mountains of Nevada are originally due to extensive foldings and faultings of

the strata during the Jurassic Age, which brought to the surface rocks ranging from the Jurassic down to the Archæan system. Some are composed of granite, syenite, porphyry, and slate, while in others limestone and calcareous spar predominate. Although some recent uplifts in the northwest are still almost unmodified, the topography of the majority of the ranges is probably due more to erosion than to the original fractures and folds. The valleys are filled with deep layers of Quaternary detritus. Volcanic rocks occur as intrusions in various places, and in the northwestern part of the State there are extensive lava fields, while other evidences of volcanic action, such as hot springs and sulphur deposits, also exist.

Besides silver and gold (see paragraph *Mining*) the minerals found within the State include antimony, lead, copper, mercury, and nickel, as well as sulphur, gypsum, and extensive deposits of salt and borax, the last found on the alkali flats and in beds of dry lakes.

MINING. Nevada owed her early development to mining. Immensely rich lodes of silver and gold were discovered, one of which—the Comstock lode (q.v.)—produced as high as \$38,000,000 worth of bullion in one year. With the apparent exhaustion of the Comstock lode, the industry decreased considerably. The output of silver continued to decrease until 1899, when the product was valued at \$1,090,457. Gold, however, revived during the last decade, the output for 1899 being valued at \$2,219,000—more than double that of 1893. Copper, lead, and iron ore are also mined. No coal has been mined since 1894. The rich mineral resources of the State afford a valuable field for future development.

AGRICULTURE. Agriculture is less developed in Nevada than in any other State. It is the most arid of the States and at the same time contains the most meagre sources for an artificial water supply. The lack of transportation facilities and of local markets retards the development of such possibilities as exist. In 1899, 504,168 acres, or 88 per cent. of the total improved area, were irrigated. The most extensive irrigated areas are along the Humboldt River and in the west-central part of the State. There are altogether 2,565,647 acres, or 3.7 per cent. of the State's area, included in farms. The industry centres about stock-grazing, the tilling of the soil being a mere adjunct to it. The animal products, together with the hay and forage and other products fed to live stock, comprise 80.6 per cent. of the total value of farm products. During the last decade of the century there was a large increase in all varieties of domestic animals. Cattle and sheep are of the greatest importance. Stock-raising being so prominent, hay and forage are naturally the most important of the crops grown. In 1899 there were 292,134 acres devoted to them, or 71.6 per cent. of the total crop area. Alfalfa constituted about one-third of this acreage. In the same year there were 18,537 acres devoted to wheat, 7043 to barley, 4786 to oats, and 2235 to potatoes. The wheat area increased five fold during the decade.

The soil is of great fertility and produces abundantly when sufficiently watered. The following table shows the relative importance and increase of the different varieties of domestic animals for the decade 1890-1900:

	1900	1890
Dairy cows.....	13,606	9,273
Neat cattle.....	371,586	201,027
Horses.....	80,296	56,788
Mules and asses.....	3,048	1,723
Sheep.....	568,251	273,469
Swine.....	16,174	7,373

MANUFACTURING. The manufacturing establishments are chiefly of a domestic nature, producing and repairing articles for local consumption. Car repair shops and flour and grist milling employ the greatest capital. The total capital of all manufacturing industries is less than \$1,500,000.

TRANSPORTATION. There has been little inducement to railroad construction in Nevada. For several years the mileage has been about 920 miles. In proportion to the area of the State the mileage is less than that of any other State. The principal line is the Southern Pacific, running from east to west through the State. There are no navigable streams.

BANKS. A national bank was organized in 1866, but soon closed. The First National Bank of Winnemucca, organized in 1886, is the only national bank in the State at present. In 1902 its capital was \$82,000; surplus, \$10,000; deposits aggregated \$511,000 and loans \$378,000. In 1902 there were two State banks. The State banking law of 1891 is very lax. The two State banks had a capital of \$300,000; surplus, \$100,000; cash, \$127,000; deposits, \$1,579,000; and loans, \$1,007,000. Most of the banking is done by agencies of California banks.

FINANCES. On admission to Statehood, in 1864, Nevada had a public debt of \$400,000, which in the following decade grew to \$738,528. This debt was in 9 and even 10 per cent. bonds, and was caused by the extravagant salaries paid to officials. The income of the State was derived partly from a tax on property, partly from a special tax on the proceeds of the silver mines. The income from this special tax grew rapidly with the output of the mines; in 1874 it amounted to 28 per cent. of the total receipts of the State treasury, and in 1878 to 50 per cent., or about \$250,000. The output of the mines rapidly declined in the eighties, and with it the income of the treasury. The total debt in 1900 was \$676,709, out of which \$380,000 are irredeemable, and only the payment of interest obligatory. The State held in trust for the educational funds \$1,529,652, which cannot be applied to payment of debts. The receipts in 1900 were \$510,608, half of which came from a general property tax, and 30 per cent. from payments on land and interest on land payment. The expenditures were \$533,402, 25 per cent. of which was for school purposes, and 25 per cent. for purchase of bonds for the school fund.

POPULATION. The falling off in the mining industry of the State, and failure to develop in other directions, have resulted in a diminution of the population. It now has the fewest inhabitants of any State, and is the only one in which a decrease is taking place. The following are the figures by decades: 1860, 6857; 1870, 42,491; 1880, 62,266; 1890, 45,761; 1900, 42,335. The largest towns are: Reno, population, in 1890, 3563; in 1900, 4500; Virginia City, population, in 1890, 8511; in 1900, 2695; Carson City, the capital, population, in 1890, 3950; in 1900, 2100.

The State has one representative in the National House of Representatives.

RELIGION. The churches do not show a strong numerical representation in Nevada. The Catholics, with a membership of about 4000, outnumber all the other churches combined. The Protestant Episcopal, Mormon, Methodist Episcopal, and Presbyterian churches are represented.

EDUCATION. The State expends a large per capita sum for educational purposes, and maintains a school term of more than seven months in length. The total expenditure for 1900 was \$224,622. The number of children of school age (five to eighteen years) was 9260; number enrolled, 6676; average daily attendance, 4698. Education is compulsory, but the law is not strictly enforced. There are about 400 pupils in the high schools of the State and over 300 in the State University—a coeducational institution located at Reno, in connection with which the Federal Government has established an agricultural experiment station. There are no normal schools. The national Government maintains a boarding school for Indian children.

CHARITABLE AND PENAL. The State supports an orphan's home, at Carson; a hospital for mental diseases, at Reno; and a State prison at Carson.

GOVERNMENT. Nevada has had but one constitution, which was adopted by popular vote in 1864. A proposed amendment may originate in either House and must receive the approval of a majority of the members elected to each House at two consecutively elected legislatures, after which it must receive a majority vote of the people. A constitutional convention may be called if approved by two-thirds of the members elected to each House and a majority of the popular vote. Suffrage is restricted to sane male citizens, twenty-one years of age, who have resided in the State six months and the district or county thirty days; the Legislature, however, has the power to make the payment of a poll tax a conditional right for voting. Carson City is the capital.

LEGISLATIVE. The aggregate number of members of both branches of the Legislature cannot exceed 75, and the Senators must not number less than one-third or more than one-half the Assemblymen. Assemblymen serve two years and Senators four years. Both are elected on the Tuesday after the first Monday in November of even years, and the sessions of the Legislature convene on the third Monday of January of odd years and cannot exceed 60 days in length.

EXECUTIVE. The Governor, Lieutenant-Governor, Secretary, Treasurer, Controller, Surveyor-General, and Attorney-General are elected at the same time as are the members of the Legislature, and serve for four years.

JUDICIAL. There are a supreme court, district courts, and justices of the peace and such city and town courts as the Legislature may establish.

LOCAL GOVERNMENT. A uniform system of county and township government is established by the Legislature, which system must provide for a board of county commissioners in each county.

MILITIA. The militia numbers 138 men.

HISTORY. The territory from which Nevada was formed was acquired from Mexico by the Treaty of Guadalupe Hidalgo, February 2, 1848, and later formed part of Utah Territory. The

first European known certainly to have entered the region was Francisco Garcés, a Franciscan friar, on his way to California from Sonora in 1775. Other friars followed him, but no settlements were made. In 1825 Peter S. Ogden, in the employ of the Hudson's Bay Company, worked inland, with a small party and came upon the Humboldt River, sometimes called the Ogden River after himself, or the Mary River, after his Indian wife. Other trappers came within the next five years, though they suffered from the attacks of the Blackfeet and Shoshone Indians. In 1826 Jedediah S. Smith crossed the entire breadth of the present State from west to east. Frémont passed through in 1843-45, and possibly occasional emigrants bound for Oregon or California settled here and there. In 1849 the Mormons founded a trading post in the valley of the Carson River, near the present town of Genoa, to supply gold-seekers on their way to California. When Utah Territory was formed, September 9, 1850, the western boundary was fixed as the summit of the Sierra Nevada Mountains and so included much of the present State, but the Territorial organization did not extend at once to the extreme west, and the inhabitants organized a government of their own. In 1853, and again in 1856, the inhabitants of the Carson Valley petitioned to be annexed to California, claiming that the Government of Utah did not protect them, and had even withdrawn the county government, so tardily given. A petition for Territorial government was sent to Congress in August, 1857, and in 1858 a provisional government was formed at Carson City with Isaac Roop as Governor. In 1860 another petition was sent to Congress and the Territorial Delegate applied for admission. Meanwhile the Comstock Lode had been discovered in June, 1859, and miners flocked thither from every direction. The new Territory was separated from Utah, March 2, 1861, being bounded on the east, however, by the 116th meridian. Another degree was cut from Utah, July 14, 1862, and on May 5, 1866, the eastern boundary was extended to the 114th meridian and that part of the State lying below 37° was taken from Arizona. In September, 1863, an election was held for delegates to form a State constitution, but the instrument submitted was defeated in January, 1864. However, the political situation made two additional Republican votes in the United States Senate exceedingly desirable, and Congress in March, 1864, again passed an enabling act; in July the Constitution was accepted, and the State was admitted October 31st. Politically the State is swayed largely by local interests. It was Republican in national elections until 1892, when it was carried by the People's Party. In 1896 and 1900 it voted for the free-silver candidate, William Jennings Bryan.

The Governors of Nevada have been as follows:

TERRITORIAL	
James W. Nye.....	1861-64
STATE	
Henry G. Blasdel.....	Republican.....1864-70

Consult: Angel, *History of Nevada* (Oakland, 1881); Bancroft, *Nevada, Colorado, and Wyoming* (San Francisco, 1890); *Nevada and Her Resources* (Carson City, 1894).

NEVADA. A city and the county-seat of Story County, Iowa, 32 miles north by east of Des Moines; on the Chicago and Northwestern and other railroads (Map: Iowa, D 3). It is the centre of a farming and cattle-raising district, and has a large cold storage plant for butter and eggs, and some manufactures, the chief products being tile and flour. There is a public library of 5000 volumes. Population, in 1890, 1662; in 1900, 2472.

NEVADA. A city and the county-seat of Vernon County, Mo., 100 miles south of Kansas City; on the Missouri Pacific and the Missouri, Kansas and Texas railroads (Map: Missouri, B 4). It has a Roman Catholic convent school, and is the seat of a State lunatic asylum and of Cottey College for Young Ladies (Methodist Episcopal, South), opened in 1884. A prominent feature of the city is Lake Park, named from a beautiful lake within the municipal limits. Nevada controls considerable trade in the products of the agricultural and stock-raising district of which it is the centre, and has large zinc smelters, a foundry and iron works, and saw, planing, flour, and feed mills. Nevada became the county-seat in 1858, and was incorporated in 1870. It is governed, under a charter of 1880, by a mayor, elected every two years, and a unicameral council. Population, in 1890, 7262; in 1900, 7461.

NEVADA, EMMA (EMMA WIXOM) (1861—). An American dramatic soprano, born in Austin, Nev. She studied under Marchesi in Vienna and afterwards in Italy. She first appeared in opera in London (1880) with Marie Van Zandt and subsequently sustained leading parts in Trieste, Pesth, Prague, Milan, Rome, Naples, and Paris, making her first professional tour of the United States in 1884-85. She had a wide repertoire, but perhaps her most successful rôle was Mignon, which part she sang for an entire year in Paris.

NEVADA CITY. A town and the county-seat of Nevada County, Cal., 166 miles northeast of San Francisco; the terminus of the Nevada County Narrow Gauge Railroad (Map: California, C 2). It is a popular health and summer resort, being esteemed for its equable climate and for its fine site, at an elevation of 2500 feet in a mountainous region. There are valuable gold mines near by, which supply the city's quartz mills. The leading occupations are mining, the cultivation of fruit and vines, and wine-making. Under a charter of 1885, the government is vested in a president and board of trustees elected on a general ticket. The town owns and operates the water-works. Nevada City was first settled in 1849, and in 1850-51 was the most important mining town in the State. It was incorporated in 1875. Disastrous fires occurred in 1851, 1856, 1858, and 1863. Population, in 1890, 2524; in 1900, 3250.

NEVADA STATE UNIVERSITY. The head of the educational system of the State of Nevada and the only institution of collegiate grade within the State. It was founded at Elko in 1873 and was removed to Reno in 1885 and formally reopened in 1886. The university comprises the college of agriculture, including de-

partments of dairying and domestic arts and sciences, the college of arts and science, the college of applied science, with departments of mining and metallurgy and mechanical and civil engineering, a normal department, and the University High School. Military instruction forms part of the curriculum and a uniform is worn by the students. The degrees conferred are those of B.A., B.S., M.A., M.S., and mining, mechanical, and civil engineer. In 1902 the faculty numbered 18 and the attendance was 310, including 90 preparatory students. The library contained 4000 volumes. The university campus covers about 40 acres and with its buildings was valued at \$200,000. The value of the college property was \$225,000, and the income \$62,000.

NÉVÉ, ná'vé'. See GLACIER.

NEVERS, ne-vâr'. The capital of the Department of Nièvre, France, and formerly of the Province of Nivernais, situated on a hill in the midst of fertile plains at the confluence of the Loire and the Nièvre, 140 miles southeast of Paris (Map: France, K 5). It is an important railway junction. The old portion of the town is ill-built, with narrow, crooked streets, but the modern portion has wide streets and a fine park. A gateway containing a Gallo-Roman museum, and two towers, are preserved remains of the mediæval fortifications. The feudal ducal castle is utilized for the Palace of Justice and also contains a museum. The chief ecclesiastical buildings are the Romanesque eleventh century Church of Saint Etienne, and the recently restored Cathedral of Saint Cyr, built in the thirteenth century on the site of a prior church, the west portion of which is incorporated in the present building; the cathedral is noted for its double apse and fine sculptures and paintings. The town possesses a public library, and numerous educational, scientific, and benevolent institutions. It has manufactures of iron and copper ware, chemicals, porcelain and cloth, an engine-fitting factory, formerly a famous naval cannon foundry, and oil mills. Nevers is the ancient Noviodunum, an important town of the Ædui. It has been an episcopal see since the sixth century, when it was called Nivernum. The town became the seat of the counts of Nevers in the tenth century and was created a dukedom by Francis I. in 1538. The dukedom of Nevers passed by marriage to a member of the family of Gonzaga, the ducal house of Mantua. On the extinction of the Gonzaga line in Mantua in 1627, Charles, Duke of Nevers, claimed the duchy. He was supported by France, and opposed by Spain and Austria. The War of the Mantuan Succession which ensued ended in the recognition of the claim of Charles of Nevers in 1630. The population of Nevers in 1900 was 27,673.

NEVERSINK HIGHLANDS. A range of hills in New Jersey. See NAVESINK HIGHLANDS.

NEVIANSKII-ZAVOD, nêv-yân'skê zá-vôd'. A mining settlement in the Government of Perm, Russia, situated on the Neiva, in the Ural Mountains, 62 miles north of Ekaterinburg (Map: Russia, K 3). It is the centre of an important mining district and contains extensive iron works, steel mills, and gold washeries. The settlement was founded in 1699. Population, in 1897, 16,066.

NEVILLE, RICHARD, Earl of Warwick. An English political leader known as the 'king-

maker.' See WAERWICK, RICHARD NEVILLE, Earl of.

NEVILLE'S CROSS, BATTLE OF. A battle between the Scotch and the English, fought on October 17, 1346. During the Hundred Years' War (q.v.) the Scotch were the firm allies of the French, and when Edward III. invaded France, King David II. of Scotland prepared to harass England. He was met, however, at Neville's Cross, near Durham, by the English under Henry Percy and Ralph Neville. The English, owing to their archers, were completely victorious, and David himself was captured. See BRUCE, DAVID.

NEVIN, ETHELBEET (1862-1901). An American composer, born at Edgeworth, Pa. After thorough preparation under local music teachers, he went to Berlin (1884) and became a pupil of Von Bülow and Karl Klindworth, the former of whom particularly encouraged his natural gift for composition. He returned to Boston in 1887 and settled there, devoting himself largely to composition, but after 1893 he spent much of his time in Europe, mostly in Paris, the south of France, Italy, and Algiers. He returned to America in 1900, and became associated with H. N. Parker in the department of music at Yale University. Of his compositions, which are almost entirely in the smaller forms, *Narcissus*, a piano number, published in a group entitled *Water Sketches*, and the song *The Rosary*, were perhaps the most popular. He was the composer of many songs, instrumental pieces and waltzes, almost all of which are marked by the delicate daintiness and originality which was characteristic of his work. He died at New Haven, Conn.

NEVIN, JOHN WILLIAMSON (1803-86). An American clergyman. He was born in Franklin County, Pa., graduated from Union College in 1821, studied theology at Princeton, and taught Hebrew there from 1826 to 1828. From 1829 to 1840 he was professor of Hebrew and biblical literature in the Western Theological Seminary at Allegheny, Pa. From here he went to the theological seminary of the Reformed (German) Church at Mercersburg, where he taught theology until 1851. He was president of Marshall College, Mercersburg, from 1841 to 1853. After this institution had united with Franklin College at Lancaster under the name of Franklin and Marshall, he served as president from 1866 to 1876. He was one of the founders of the 'Mercersburg theology' (q.v.). He was the editor of and principal contributor to *The Mercersburg Review* from 1849 to 1853. He published: *Biblical Antiquities* (2 vols., 1828; revised ed. 1849); *The Anxious Bench* (1842); *The Mystical Presence* (1846); *History and Genius of the Heidelberg Catechism* (1847); *Anti-Christ; or, the Spirit of Sect and Schism* (1848). Consult his biography by Appel (Philadelphia, 1889).

NEVIS, nēv'is. One of the Leeward Islands in the West Indies, belonging to Great Britain. It lies two miles southeast of Saint Christopher, with which it is administratively connected (Map: West Indies, Q 6). Area, 50 square miles. It consists largely of an extinct volcano, 3596 feet high and wooded at the summit. The lower slopes are fertile and well cultivated, producing sugar-cane and some limes and oranges. The population in 1891 was 13,087, and in 1901, 12,774. The chief town is Charlestown, with a

good roadstead and a population (1901) of 1383. The island was discovered by Columbus in 1498. It was colonized by the English in 1628. In 1899 it suffered from a disastrous hurricane.

NEVIS, BEN. See BEN NEVIS.

NEVOME, ne-vō'mā. A Mexican Indian tribe of Piman stock, numbering about 8000.

NEVSKI (nyāf'ské) PROSPEKT'. The chief street of Saint Petersburg, extending for about three miles in a straight line, and faced by some of the finest shops and public buildings of the city. It is 150 feet in width, and in winter presents a scene of great animation.

NEW, JOHN CHALFANT (1831-). An American politician, born at Vernon, Ind. He graduated at Bethany College, (West) Virginia, in 1851, and settled in Indianapolis, where he was admitted to the bar in 1852. In 1861 he was appointed quartermaster-general of Indiana, a post which he held throughout the Civil War. In 1862 he was a member of the Indiana State Senate. After the war he engaged for several years in banking, and in 1875 was appointed by President Grant, Treasurer of the United States. In 1882 President Arthur appointed him Assistant Secretary of the Treasury. He was active in securing the nomination and election of Benjamin Harrison in 1888 to the Presidency, and as a reward for his services was appointed United States Consul-General at London, England, which position he held until 1892.

NEW ACADEMY. A school of Greek philosophers, the successors and expositors of Plato. The various schools classed under the name of the Academy are differently divided by modern historians. The third school, headed by Carneades (q.v.), is sometimes referred to as the New Academy, though it is perhaps more often classed, with the second, under the name of Middle, the New beginning a little later with Philo of Larissa, who founded the fourth school.

NEW ALBANY. A city and the county-seat of Floyd County, Ind.; on the north bank of the Ohio River, two miles below the falls, and opposite Louisville, Ky., with which it is connected by a long railroad bridge, and on the Louisville, Evansville and Saint Louis, the Louisville, New Albany and Chicago, the Baltimore and Ohio Southwestern, and the Pittsburg, Cincinnati, Chicago and Saint Louis railroads (Map: Indiana, D 4). It has a fine city hall and court house, post office and custom house, large fair grounds, De Pauw College for women, and a public library. In the suburbs there is a national cemetery which contains 2908 graves, 676 of unknown dead. The city controls large commercial interests, and is an important manufacturing centre, having tanneries, woolen mills, furniture factories, engine and boiler works, rolling, planing, and flour mills, iron foundries, plate glass works, and pork-packing establishments. New Albany was laid out in 1813 and incorporated as a city in 1839, the charter of that year being still in operation and providing for a mayor, chosen every four years, and a unicameral council, which elects subordinate municipal officers. Population, in 1890, 21,059; in 1900, 20,628.

NEW AMSTERDAM. The name of New York City (q.v.) under the Dutch.

NEW ARCHANGEL. The former name of Sitka (q.v.).

NEWARK, nŭ'ĕrk, or **NEWARK-UPON-TRENT**. A municipal borough and market-town of Nottinghamshire, England, on a navigable branch of the Trent, 16 miles southwest of Lincoln (Map: England, F 3). Newark is one of the most important malting towns in England, and has flour mills, breweries, manufactories of agricultural implements and boilers, gypsum and limestone quarries, and a trade in corn, malt, and flour. The corn market is one of the largest in the kingdom. The parish church, a large and elegant edifice, though often rebuilt, still shows traces of its original Norman character. The grammar and song school was founded in 1529. Newark was incorporated in the reign of Edward VI. and received further charters from Charles I. and Charles II. The town owns the water-works and markets, and maintains a free library and public baths. It dates from the Roman occupation. The castle, now in ruins, was built early in the twelfth century. King John died in it in 1216. From its position and great strength it was called 'the Key of the North,' and during the Civil War sustained three sieges for Charles I., finally surrendering at his request to the Scots in 1646. Population, in 1891, 14,450; in 1901, 15,000. Consult Cornelius Brown, *Annals of Newark-upon-Trent* (London, 1879).

NEWARK, nŭ'ĕrk. A town in Newcastle County, Del., 12 miles west by south of Wilmington; on the Baltimore and Ohio and the Philadelphia, Baltimore and Washington railroads (Map: Delaware, O 2). It is the seat of Delaware (State) College (q.v.), and of Newark Academy. There are extensive paper manufactures, also wall-paper mills, fibre works, machine shops, etc. The water-works and electric light plant are owned and operated by the municipality. Population, in 1890, 1191; in 1900, 1213.

NEWARK, nŭ'ĕrk. The largest city of New Jersey, a port of entry, and the county-seat of Essex County, eight miles west of New York; on the west bank of the Passaic River, which empties into Newark Bay three miles below the city proper, and on the Pennsylvania, the Lehigh Valley, the Lackawanna, the Erie, and the Central of New Jersey railroads (Map: New Jersey, D 2).

The city occupies an area of about 18½ square miles on a generally level plain. Toward the west, however, the ground rises, affording the beautiful sites of a popular residential district. Though Newark contains the homes of many business men of New York, it has distinct individuality as a manufacturing city, and many members of its industrial and commercial community find homes in the beautiful surrounding suburbs of the Oranges, Montclair, Caldwell, Irvington, and other places with which the city is connected by a network of electric railways. The streets are regularly laid out, and the main avenues are broad and well paved with granite or asphalt, 137 miles of the total street mileage (231) being paved. Broad Street, the principal thoroughfare and business street, having a width which justifies its name, presents a handsome appearance, enhanced by the stately elm-trees in the parks that border it for a considerable distance. There are many public parks—Branch Brook, Military (formerly the old training ground), Washington, Lincoln, East Side, and West Side; and statues of General Philip Kearny, Frederick T.

Frelinghuysen, and Seth Boyden, the inventor, a bronze bust of Abraham Coles, and a bronze Indian group. The finest edifices include the Federal building, accommodating the custom house and post office; the Public Library, which cost \$350,000; the Prudential Life Insurance building, the high school, and the Peddie Memorial Church. The City Hospital, the German, Saint Michael's, Saint Barnabas, and Saint James hospitals, and the Essex County Hospital for the Insane are among the more prominent charitable institutions. There are in the city nine public hospitals, fourteen public homes, and four orphan asylums. Newark has the Newark Academy, a well-known classical school of long standing, Saint Benedict's College, and the Newark Technical School, a city institution. The Public Library contains 80,000 volumes. Other libraries are the Board of Trade, Young Men's Catholic Association, County Law, High School, and State Historical Society. The last-named institution has also an interesting collection of relics.

Newark is essentially an industrial centre, having long been noted for the extent and variety of its products, which, according to the census of 1900, were valued at \$126,954,000. The more important manufactures include leather, machinery, foundry and machine-shop products, jewelry, saddlery, hardware, celluloid, spool cotton, boots and shoes, carriages, hats and caps, clothing, trunks, paper, varnish, chemicals, rubber, beer, and ale. The water frontage of the city extends along the Passaic River and Newark Bay for a distance of 10½ miles, and there is a large trade by river, as well as by rail.

The government is vested in a mayor, elected every two years, a unicameral council, and subordinate administrative officials appointed or elected as follows: By the mayor—city counsel, attorney and assistant, excise and assessment commissioners, trustees of the public library, and police justices; by the mayor with the consent of the council—police, fire, and health commissioners, city comptroller, auditor, and tax commissioners; by the council—treasurer, tax receiver, city clerk, and building inspector, and assistants; by popular vote—board of education, and board of street and water commissioners. The annual expenditures for maintenance and operation are about \$4,875,000, the principal items being \$900,000 for schools, \$425,000 for the police department (including amounts for police courts, jails, reformatories, etc.), \$410,000 for interest on debt, \$340,000 for the water-works, \$300,000 for the fire department, \$215,000 for municipal lighting, \$205,000 for charitable institutions, and \$125,000 for street expenditures. The water-works, built at a cost of \$6,000,000, are owned and operated by the municipality, the entire system now comprising about 300 miles of mains. There are nearly 180 miles of sewers. Newark has (1902) a bonded debt of \$17,585,000, and an assessed property valuation (real and personal) of about \$160,000,000.

Population, in 1810, 8008; 1830, 10,953; 1850, 38,894; 1860, 71,941; 1870, 105,059; 1880, 136,508; 1890, 181,830; 1900, 246,070, including 71,400 persons of foreign birth and 6700 of negro descent.

Newark was settled in 1666 by a party of thirty from Milford, Conn., led by Robert Treat. In 1667 a company from Guilford and Branford, dissatisfied with the union of New Haven and

Connecticut, came here under the leadership of Abraham Pierson. The settlement was strictly religious, the rights of full citizenship being restricted to members of the Congregational Church. At first called Milford, it was renamed in 1667 after Pierson's English home, Newark-upon-Trent. It originally included a large part of the present Essex County, in which the towns of Belleville, Bloomfield, Clinton, Montclair, and the Oranges later grew up. In 1745-46 the English grantees of East Jersey attempted to invalidate the Indian titles of the settlers, claiming that they alone could grant land. Riots ensued which were repressed with difficulty. Newark was chartered as a town in 1712; in 1777 it was occupied first by Washington, and then, along with all that section of New Jersey, by the British, who plundered the inhabitants and destroyed much property. The College of New Jersey, later Princeton University (q.v.), was located here from 1748 to 1756. In 1798 Newark received a second town charter, and in 1836 was incorporated as a city. In 1836 occurred the most destructive fire in the city's history, and in 1837 the wide-spread business panic caused much distress. Consult: Atkinson, *The History of Newark, N. J.* (Newark, 1878); and *Records of the Town of Newark, 1666-1836* (Newark, 1864).

NEWARK. A village in Wayne County, N. Y., 32 miles east by south of Rochester; on the Erie Canal, and on the New York Central, the West Shore, and the Northern Central railroads (Map: New York, C 2). It has a public library of 3000 volumes and is the seat of the State Custodial Asylum for Feeble-Minded Women. The surrounding country is a productive agricultural section; and the chief industries of the village include the distillation of peppermint oil, fruit-preserving, the growing of roses and nursery stock, and the manufacture of cut glass, tinware, boxes, flour, foundry products, etc. Population, in 1890, 3698; in 1900, 4578.

NEWARK. A city and the county-seat of Licking County, Ohio; 33 miles east of the State capital, Columbus; at the junction of the forks of the Licking River, and on the Pennsylvania and the Baltimore and Ohio railroads (Map: Ohio, F 5). It has also good interurban electric railway service. Situated in a plain surrounded by hills, Newark is attractively laid out, twelve miles of its streets being paved with vitrified brick. The Auditorium, a memorial to the soldiers and sailors who died in the Civil War, is one of the finest theatres in the State. Two of the most extensive earthworks of the mound-builders are here, comprising a circular embankment, one mile in circumference, and a larger series of fortifications, called the Octagon Fort. Tributary to the city are fertile agricultural sections, and areas of natural gas, coal, and sandstone. The manufacturing interests are very important, the establishments including electric car works, table glassware and bottle works, locomotive shops of the Baltimore and Ohio, stove foundries, bent-wood works, rope-halter factory, hardwood sawmill, cigar factory, engine and machine works, and iron foundry, agricultural implement works, flouring mills, carriage factory, chemical laboratory, etc. Newark was settled in 1801, and was laid out as a town in the following year. Population, in 1890, 14,270; in 1900, 18,157.

NEWARK SERIES. The name given to the Triassic system in the eastern part of North America. Along the Atlantic coast from Nova Scotia to South Carolina there are many isolated areas of thick bedded red sandstones, conglomerates, and breccias, which throughout their extent exhibit marked uniformity of characteristics. The sedimentary rocks are accompanied by dikes and sheets of basalt indicating intense volcanic activity at the time of their formation. Fossils are rare and mostly of fresh-water or land types, the commonest being land plants and foot-prints of animals. The micaceous and feldspathic nature of the sandstone shows that it was derived from the waste of crystalline rocks. In North Carolina and Virginia the series contains workable coal seams; it also yields a good quality of building stone—the brown sandstone of Connecticut and New Jersey. See TRIASSIC SYSTEM.

NEW ATLANTIS, THE. The name given by Lord Bacon, in his allegory bearing the same title, to an island supposed to lie in the Southern Atlantic, on which the author is shipwrecked. There he finds an organized association for natural science and the arts. See ATLANTIS.

NEWAYGO, nē-wā'gō. A village and the county-seat of Newaygo County, Mich., 37 miles north of Grand Rapids; on the Muskegon River, and on the Pere Marquette Railroad (Map: Michigan, H 5). It is situated in a region that has attained considerable popularity as a place of resort, being noted particularly for its hunting and fishing. The village, especially known for its cement works, is engaged in manufacturing also furniture, flour, and lumber products. Population, in 1890, 1330; in 1900, 1172.

NEW BEDFORD. A port of entry and one of the county seats of Bristol County, Mass., 56 miles south of Boston; the terminus of a division of the New York, New Haven and Hartford Railroad (Map: Massachusetts, F 4). It is situated near the mouth of the Acushnet River, which expands into a fine, spacious harbor leading into Buzzard's Bay. Fort Rodman, on Clark Point, with a garrison of 120 men, defends the harbor's entrance. A drive, over four miles in length, extends around the point and to the city, commanding splendid marine views. New Bedford, in area about 19½ square miles, is regularly laid out, and its streets are paved chiefly with gravel and macadam. Among the prominent structures are the city hall, the county court house, the post office, the Public Library, Masonic and Odd Fellows' buildings, Saint Luke's and Saint Joseph's hospitals, Saint Mary's Home, the Textile School, and the Merchants' National Bank. A State armory is (1903) in course of construction. The Public Library (73,000 volumes) is one of the oldest free public libraries in the United States, having been opened in 1853. The library was founded, however, some fifty years before it became a municipal institution. The corner-stone of the present building was laid in 1856. The public parks, aggregating 255 acres, are: the Common, Brooklawn, Buttonwood, Hazelwood, and Grove. The New Bedford and Fairhaven bridge, which spans the harbor, cost \$1,500,000, and is one of the features of the city.

New Bedford, once noted for its extensive whaling interests, is now distinctively a manufacturing centre, known particularly for the production

of fine cotton goods and cotton yarns. According to the census of 1900, capital to the amount of \$29,073,000 was invested in the various industries, which had an annual output valued at \$25,682,000, \$16,749,000 representing the value of cotton goods alone. The cotton mills in 1900 contained 1,369,380 spindles; the cotton cloth mills had 23,351 looms. There are also foundries and machine shops, oil manufactories, cordage works, carriage and wagon shops, paint works, lumber mills, etc. The trade of the city is considerable, the leading commodities being coal, of which 560,000 tons are received annually, cotton, lumber, fish, and general merchandise.

Under the revised charter of 1896, the government is vested in a mayor, chosen annually; a bicameral council, the aldermen being elected on a general ticket; and administrative officers chosen as follows: Board of health, license commission, and park commission, appointed by the mayor and confirmed by the board of aldermen; water board, fire department, and overseers of the poor, elected by the city council; school committee, chosen by popular vote. The water-works are owned and operated by the municipality. The system, which cost about \$3,100,000, comprises two sources of supply, the first works having been built in 1865-69 and the new works in 1895-99. The original supply is held wholly for emergency purposes. There are now ninety-nine miles of mains. New Bedford spends annually in maintenance and operation over \$1,000,000, the principal expenditures being: for schools, \$235,000; for interest on debt, \$155,000; for the police department, \$115,000; for the fire department, \$80,000; for streets, \$70,000; for hospitals, asylums, and other charitable institutions, \$70,000; for lighting, \$50,000. The assessed valuation of property (real and personal) was (1902) \$65,000,000; the bonded debt, \$3,903,000. Population, 1790, 3313; 1850, 16,443; 1880, 26,845; 1890, 40,733; 1900, 62,442, including 25,529 persons of foreign birth and 1685 of negro descent.

New Bedford formed part of Dartmouth until 1787 and was not incorporated as a city until 1847. For many years, and especially between 1818 and 1857, it was a centre of the American whale-fishing industry. During the Revolution New Bedford sent out many privateers, and, from its convenient location, became the storehouse of captured prizes. On September 5, 1778, an English fleet of thirty-two vessels and an army under General Gray attacked the town, captured it, and reduced the greater part of it to ashes, the damage amounting to about \$450,000. Consult: Ricketson, *History of New Bedford* (New Bedford, 1858); *Centennial in New Bedford* (New Bedford, 1876).

NEWBERRY. A city, port of entry of the Pamlico district, and the county-seat of Craven County, N. C., 107 miles southeast of Raleigh; on the Neuse River at its confluence with the Trent, and on the Atlantic and North Carolina and the Atlantic Coast Line railroads (Map: North Carolina, E 2). It is connected by steamships with New York, Baltimore, and Norfolk, passing through inland water routes, and exports fish, cotton, lumber, and vegetables. It has hosiery and knitting mills, cottonseed oil and lumber mills, machine shops, canning, barrel, carriage, fertilizer, and cigar factories, and exten-

sive fish and oyster and truck-gardening interests. The most prominent architectural features of the city are the Government building, the county court house, and two bridges over the Neuse and Trent rivers, both affording fine views of river scenery. The government, under a charter of 1899, is administered by a mayor, elected every two years, and a unicameral council. The water-works and electric light plant are owned and operated by the municipality. Newbern was settled by Swiss in 1710, was for a time the capital of the Province of North Carolina, and for many years was its most important seaport. It was strongly fortified during the Civil War, but was captured by General Burnside, March 14, 1862, after a severe engagement three miles from the city, the Union loss being about 100 killed and 500 wounded. Population, in 1890, 7843; in 1900, 9090.

NEWBERRY. A town and the county-seat of Newberry County, S. C., 43 miles west-northwest of Columbia; on the Southern and the Atlantic Coast Line railroads (Map: South Carolina, C 2). It has a fine city hall and court house, and Newberry College (Lutheran), which was opened in 1858. The centre of a productive cotton-growing section, Newberry carries on a considerable trade, and manufactures cotton goods, cottonseed oil, fertilizers, coffins, etc. The government is administered, under a charter of 1894, by an annually elected mayor and a unicameral council. The water-works and electric light plant are owned and operated by the municipality. Population, in 1890, 3020; in 1900, 4607.

NEWBERRY, JOHN STRONG (1822-92). An American geologist, born in Windsor, Conn. He spent most of his early life in the Western Reserve of Ohio, and received his college education at the Western Reserve University, at Hudson, Ohio, from which he graduated in 1846, and then entered the Cleveland Medical School, where he received the degree of M.D. in 1848. Going to Europe, he spent two years in Paris in post-graduate work in medicine and paleontology. On his return to the United States, in 1851, he took up the practice of medicine in Cleveland, but in 1855 he joined an exploring expedition under Lieutenant Williamson, sent out by the War Department to examine the country between San Francisco and the Columbia River. His geological investigations were published as a separate volume of the *Reports of Explorations and Surveys to Ascertain the Most Practical and Economic Route for a Railroad from the Mississippi River to the Pacific Coast, Made in 1855-56* (Washington, 1857). In 1857-58 he acted as geologist to an expedition headed by Lieutenant Ives, sent out to explore the Colorado River. Newberry's paper relating to the geology, physiography, and Indian tribes, undoubtedly forms the most valuable and interesting part of the *Report on the Colorado River of the West, Explored in 1857-58* (Washington, 1861). The next year Newberry again went into the field, this time as naturalist of an expedition under Captain Macombe, which explored southwestern Colorado and adjacent parts of Utah, Arizona, and New Mexico. The results of this appeared in 1876 under the title of *Reports of the Exploring Expedition from Santa Fé to the Junction of the Grande and Green Rivers* (Washington, 1876).

During the Civil War he performed the duties of secretary to the Sanitary Commission for the Mississippi Valley, and after the administration of this work he became attached to the Smithsonian Institution, at the same time holding a professorship in the Columbian University at Washington, to which he had been called in 1857. In 1866 he was offered the chair of geology and paleontology in the School of Mines, Columbia College, which he accepted, and held for twenty-four years. In 1869, when the Ohio Geological Survey was established he was made director and personally did much of the work described in several of the reports. He did much work for the Illinois Geological Survey, and also described the extensive collections of fossil plants gathered by Hayden's survey of the West. In 1867 he was elected president of the American Association for the Advancement of Science, and in the same year he was chosen president of the New York Academy of Sciences, which position he held for twenty-four years. He was also president of the Torrey Botanical Club from 1880 to 1890, and assisted in the organization of the Geological Society of America at Cleveland in 1888, and served as a member of the commission to organize an international geological congress, of which he subsequently became president. During the latter part of his life he resided in New Haven, Conn.

In addition to the works above mentioned, Dr. Newberry also wrote the following: *The Rock Oils of Ohio* (1859); *Iron Resources of the United States* (1874); *The Structure and Relations of Dinichthys* (1875); *Report on the Fossil Fishes Collected on the Illinois Geological Survey* (1886); *Fossil Fishes and Fossil Plants of the Triassic Rocks of New Jersey and the Connecticut Valley* (1888); *Paleozoic Fishes of North America* (1889); and *Later Extinct Floras* (1898).

NEWBERRY, JOHN (1713-67). A famous English bookseller and publisher, the son of a poor farmer of Waltham Saint Lawrence, in Berkshire. He attended the village school, but he educated himself mainly by reading. In 1730, he went to Reading, where he entered the service of William Carnan, editor of the *Mercury*. After the death of his employer, in 1737, he married his widow. Somewhat later, he opened in London a bookshop and publishing house in Saint Paul's Churchyard (1745). He started several newspapers. In *The Universal Chronicle and Weekly Gazette* (founded 1758) appeared Johnson's *Idlers*; and in *The Public Ledger* (founded 1760) appeared Goldsmith's *Citizen of the World*. Newberry was the first publisher to issue books especially for the young. His *Juvenile Library* was made up of dainty volumes bound in flowered and gilt Dutch paper. Among them were *Goody Two Shoes* (reprinted with introduction by C. Welsh, London, 1881) and *Tommy Trip and His Dog Growler*.

NEWBOLT, HENRY JOHN (1862—). An English writer, born June 6, 1862, at Bilston, Staffordshire, where his father was vicar of Saint Mary's Church. He was educated at Clifton College, Bristol, and at Corpus Christi, Oxford, where he took first honors in the classics. Called to the bar at Lincoln's Inn (1887), he practiced his profession till 1899. In 1900 he established the London *Monthly Review*. He is best known

for his martial poems in *Admirals All* (1897) and *The Island Race* (1898, largely a reprint). Among his other publications are a novel entitled *Taken from the Enemy* (1892); *Mordred*, a tragedy; *Stories from Froissart* (1899); and *Froissart in Britain*, with illustrations taken from originals in the British Museum (1900).

NEW BRAUNFELS, broun'felz. A city and the county-seat of Comal County, Texas, 32 miles northeast of San Antonio; at the confluence of the Guadalupe and Comal rivers, and on the International and Great Northern and the Missouri, Kansas and Texas railroads (Map: Texas, E 5). The Comal River, though short, is of considerable volume, having its source in large artesian springs. The city is the distributing point for an extensive farming and cattle-raising district, and is industrially important because of its good water power, some of the largest flouring mills in the State being located here. The principal manufactured products include flour, cottonseed oil, leather, bricks, and wagons. Population, in 1890, 1608; in 1900, 2097 (mostly of German descent).

NEW BRIGHTON, bri'ton. A borough in Beaver County, Pa., 29 miles northwest of Pittsburgh; on the Beaver River, and on the Pittsburgh, Fort Wayne and Chicago, the Pittsburgh and Lake Erie, and other railroads (Map: Pennsylvania, A 3). It has a public art gallery, Beaver Valley General Hospital, Y. M. C. A. and public high school libraries, and a public park. The river furnishes extensive water power, and there are deposits of coal and clay in the vicinity. New Brighton is an important industrial centre, its manufactures including pottery, bricks, sewer pipe, glass, flour, twine, lead kegs, coffee mills, nails, rivets, wire, etc. Population, in 1890, 5616; in 1900, 6820.

NEW BRITAIN. The former name of the Bismarck Archipelago (q.v.); also applied to the largest island of the archipelago, now called New Pomerania (q.v.).

NEW BRITAIN. A city in Hartford County, Conn., 10 miles southwest of Hartford, on the New York, New Haven and Hartford Railroad (Map: Connecticut, D 3). It has a State Normal School, a Roman Catholic cathedral, New Britain Institute, and a fine public park of about 75 acres, besides several smaller areas. New Britain is noted for its extensive manufactures, which, according to the census of 1900, represented an invested capital of \$14,116,000, and had a production valued at \$12,261,000. The most important manufactures are hardware, foundry and machine-shop products, cutlery and edge tools, hosiery and knit goods, stamped ware, saddlery, hardware, etc. The government is administered, under a revised charter of 1896, by a mayor, chosen every two years, and a unicameral council which controls elections of the majority of subordinate municipal officers. The city clerk and assistant, treasurer, collector, auditor, and sheriff are, however, chosen by popular vote. The school board is independently elected by the town. There are municipal waterworks. Population, in 1890, 16,519; in 1900, 25,998. New Britain was settled in 1687, and was incorporated as a parish under the name 'New Britain Society' in 1754. It was separated from Berlin and incorporated as a township in 1850, and in 1871 was chartered as a city. It

was the birthplace and home of Elihu Burritt (q.v.). Consult Camp, *History of New Britain* (New Britain, 1889).

NEW BRUNSWICK, brūnz'wīk. A province of the Dominion of Canada. It lies between latitudes 44° 30' and 48° 6' N. and longitudes 63° 47' and 69° 5' W., and is bounded on the north by Quebec and the Bay of Chaleur, on the east by the Gulf of Saint Lawrence and Northumberland Strait, on the south by Nova Scotia and the Bay of Fundy, and on the west by the State of Maine and Quebec. It has an area of 28,200 square miles, including 100 square miles of water area.

TOPOGRAPHY. The coast on the Gulf of Saint Lawrence is low and sandy, with numerous spits and lagoons; that on the Bay of Fundy is bold and rocky. The latter is protected from the scouring action of the extraordinarily high tides by a ridge of hard Cambrian rock with small areas of Silurian and Devonian as well as of the older Huronian and Laurentian systems. Another ridge, composed of granite, traverses the province from the southwestern to the northeastern corner. It forms the main divide between the eastern and western rivers, and has an average height of 1000 to 1500 feet, with a number of detached monadnocks from 2000 to 2500 feet high. These ridges are regarded as outlying branches of the Appalachian system. They inclose between them a large, triangular tract of low, undulating plain, occupying the eastern half of the province, and underlain by the Carboniferous system. West of the dividing range is a Silurian plateau much eroded and trenched by the valley of the Saint John River. The geology of the province is somewhat confused, and not yet definitely understood; but it is probably in many respects similar to that of Nova Scotia (q.v.).

Nearly all the western half of New Brunswick is drained by the River Saint John, which, after forming for a long distance the boundary with Maine, flows through the province in a southerly direction as far as the 46th parallel, then turns to the east, and discharges into the Bay of Fundy, through an estuary extending north and south for about fifty miles. The northeastern part of the province is drained into the Gulf of Saint Lawrence through a large number of small streams. There are numerous lakes. Grand Lake, in the south central portion, is the only one of considerable size. The coast line is 500 miles in extent, and is indented by spacious bays, inlets, and harbors. The chief are: Fundy, Chignecto, and Cumberland bays, the last two being merely extensions of the first; Passamaquoddy Bay in the south; Verte, Shediac, Cocaigne, Richibucto, and Miramichi bays on the east; and the Bay of Chaleurs, 90 miles long by 12 to 25 broad, in the northeast.

CLIMATE. New Brunswick is subject to extremes of heat and cold. At inland points the extremes are greatest, the temperature sometimes falling to 30° below zero in the winter and rising to 95° in the summer. The atmosphere, however, is drier than on the coast, and the extremes do not occasion great discomfort. Spring opens later and summer lingers longer than in the provinces farther west. The rainfall for the province averages above forty inches.

MINING. Although a large part of the province is occupied by Carboniferous strata, the mineral coal is for the most part impure or in thin seams,

and is but little worked. The coal-like mineral 'albertite,' formerly mined with great profit in Albert County, has long since been exhausted. Salt springs are numerous. Nickel and iron ore are found, as are also antimony and manganese. Gypsum, plumbago, grindstone, and limestone are very abundant, and the freestone of the province, unsurpassed for beauty and durability, commands a high price in the States.

FISHERIES. From an early period fishing has been one of the leading industries. The waters on both coasts rank among the best fishing grounds of the world. For a decade and a half the annual earnings from fisheries have been about \$4,000,000, Nova Scotia alone, among the Maritime Provinces, exceeding that amount. New Brunswick thus nearly ranks with Massachusetts, which is the leading sea-fishing State of the United States. The herring, smelt, sardine, and lobster fisheries are of greatest importance, and in the first three New Brunswick leads all the other provinces.

AGRICULTURE. The kind and quality of soil vary greatly with the underlying geological formation, but it is generally fertile, though much of the surface is too hilly to admit of profitable cultivation. In most of the valleys, and in the diked districts, for instance at the head of the Bay of Fundy, the fertility is of a high grade. Originally, the whole area was covered with forests, of which about one-half has been removed. The nature of the forests is not uniform, but they usually consist of both hard and soft woods. On the Bay of Fundy the species are largely confined to spruces and firs, as a consequence of the cold winds of that region. Spruce, fir, and tamarack also prevail in the western part of the province. But farther eastward the hard-wood varieties, such as maple, beech, ash, and birch, prevail, interspersed with spruce and pine. The elm abounds in the river valleys, and with it are found the birch and red maple. In 1902 a law was passed for the establishment of a large national park and game preserve at the sources of the Tobique, Nipisiguit, and Miramichi rivers. The destruction of the forests in New Brunswick, as in the other Maritime Provinces, seems to have had a climatic effect quite different from that which usually follows, namely, the rainfall increases, resulting in the growth of the soft woods—balsam, spruce, and tamarack—in the region where the hard woods were removed.

Agriculture is the leading occupation, but it has not reached extensive proportions. The natural growth of marsh hay in the valleys supplies an abundant and valuable hay product. About 180,000 acres are devoted to oats. Buckwheat, potatoes, and wheat are next in importance in the order named. The conditions especially favor the growth of turnips and other root crops. On the other hand, the climate is rather too severe for the large fruits, except in certain regions like the valley of the Saint John, where the hardier varieties are successfully grown. The smaller fruits, however, are abundant, and, ripening late, are put on the New England market at monopoly prices. The situation of the province on the seaboard gives it a marked advantage in marketing produce.

Considerable attention is given to the raising of sheep, and more especially cattle, and in very recent years there has been a decided growth in the dairy industry.

MANUFACTURING AND COMMERCE. Dominion, provincial, and municipal aid has greatly facilitated the construction of railways; the mileage for all lines aggregated 1438 miles in 1900. The Canadian Pacific connects the province with the railroad systems west by running west from Saint John and crossing the State of Maine. The Intercolonial enters the province from Quebec on the north and traverses the east side of the province, one branch connecting with Saint John. The position of New Brunswick on the Atlantic coast, and the large number of excellent harbors, greatly favor its commercial advantage. The foreign trade of the province passes through the port of Saint John. Regular ship lines connect this port with Atlantic coast points to the south, and with European countries. In 1900 the merchant marine consisted of 122 steamers and 805 sailing vessels, the total net tonnage being 78,700. Lumber is the chief article of export. The manufacture of lumber and of lumber products lead the manufacturing industries. Ship-building, which was formerly important, has been all but discontinued. The manufacture of wood-pulp, on the other hand, is assuming large proportions, and the future of the industry is assured, because the supply of spruce—the wood used for this purpose—is practically inexhaustible. In 1900 the creameries in the province numbered 33 and the cheese factories 54.

In 1900 there were 43 savings banks, with 7062 depositors and an average deposit of \$353.46. In the same year there were five Government savings banks, having 15,887 depositors, with an average deposit of \$396.20.

GOVERNMENT AND FINANCE. The administration of the Government is in the hands of a Lieutenant-Governor and his council of six paid members and from one to four honorary members. The legislative body is called the House of Assembly, its forty-six members being elected for a term of four years. The legislative council was abolished in 1892. In striking contrast to some other Canadian provinces, there are no local municipal councils, the municipal affairs being managed by a county council. In this council each parish has two representatives, who serve without emolument (except in the County of Carleton), the term of office being one year. The various parish officers receive their appointments from the county council. The net debt of the province in 1900 was \$2,751,000, or \$8.56 per head of the population. The expenditures for the same year amounted to \$794,000, and the receipts to \$758,000. Over half the receipts came from the Dominion subsidy, the timber licenses being next in importance. Taxes are levied by the province upon telegraph, telephone, and insurance companies and banks. There is also a succession duty upon estates. Local expenditures are met by taxes collected upon real and personal property, income, and polls. Property is rated at its full value. The capital of New Brunswick is Fredericton.

POPULATION. There is a high birth-rate in the province, but also a rather large emigration. The censuses for 1891 and for 1901 gave, respectively, 321,263 and 331,120. There is a small French element. The great bulk of the population is of British origin, the Irish especially being well represented. Saint John has a population of 40,700 (1901), and Moncton 9000.

RELIGION. The Catholics number a little over

one-third of the total religious membership of New Brunswick. Among the Protestants the Baptists are strongest, followed by the Anglicans, Presbyterians, and Methodists, in the order named.

EDUCATION AND CHARITIES. Educational affairs are in the hands of a superintendent of education and an educational council. Unlike Quebec and Ontario, the province does not provide for separate denominational schools. There is uniformity of methods, text-books, etc., throughout the province. One in every 5.22 of the population is enrolled in the public schools, the proportion between the grammar and the elementary enrollment being one to sixty. The province also maintains normal schools and provides for higher education at the University of Fredericton. The different religious sects maintain seminaries and universities, of which Mount Allison University (Methodist) is the largest. The expenditure per capita of the total population shows a steady increase from \$1.26 in 1888 to \$1.88 in 1900. Of this amount, 67.94 per cent. is raised by local assessment.

Of the charitable institutions, the asylums for the insane constitute the greatest item of expenditure. The province supports also, in whole or part, a general hospital (at Saint John), a boys' industrial home, and deaf and dumb institutions. Private and sectarian interests are well represented in charitable work. Convicts sentenced to penal life are sent to the Dominion penitentiary at Dorchester.

HISTORY. The first European settlement was made on the Bay of Chaleurs by Frenchmen in 1639, and in 1672 further settlements were made on the Miramichi River and along the coast. With Nova Scotia, New Brunswick formed the original French colony of Acadia or New France, which was taken by the English in 1654, restored to France in 1667, but re-ceded to the English in 1713 by the Treaty of Utrecht, although disputes as to the boundaries lasted until the Treaty of Paris in 1763 finally settled the question in favor of the British. The first British settlements were made by Scotch agriculturists and laborers along the Miramichi in 1764. In 1783 over 5000 United Empire Loyalists from the United States settled in the colony. In 1784 Nova Scotia and New Brunswick separated to form distinct colonies, and in January, 1786, the first legislative assembly of New Brunswick met at Saint John. In 1867 New Brunswick united with Ontario, Quebec, and Nova Scotia and thus became one of the original provinces of the Dominion of Canada.

NEW BRUNSWICK. A city and the county-seat of Middlesex County, N. J., 23 miles southwest of Newark; at the head of navigation on the Raritan River, about 15 miles from its mouth, and on the Pennsylvania and the Raritan River railroads (Map: New Jersey, D 3). It is the terminus of the Delaware and Raritan Canal. A magnificent new railway bridge over the river

is in course of construction. The city has a public library with over 17,300 volumes and the Gardner A. Sage Library of 44,500 volumes, and is the seat of Rutgers College (q.v.), connected with which is the Theological Seminary of the Dutch Reformed Church, and of the State Agricultural and Mechanical College with the State model farms. New Brunswick is extensively engaged in manufacturing hosiery, wall paper, rubber boots and shoes, bicycle tires, chemicals, fruit jars, boilers, cigars, foundry products, knitting needles, sash and blinds, shoes, etc. Under a charter of 1863, the government is vested in a mayor, elected biennially, a unicameral council, and in administrative boards. The boards of library trustees and of health are appointed by the mayor; the board of water commissioners is elected by the council; the board of education is chosen by popular vote. The water-works are owned and operated by the municipality. Population, in 1890, 18,603; in 1900, 20,006. The first settlement here was made in 1681. The place was first called 'Prigmore's Swamp' (1681-97), then 'Inion's Ferry' (1691-1714), and finally New Brunswick, in honor of the House of Brunswick. New Brunswick was incorporated as a town in 1736, and was chartered as a city in 1784. It suffered much during the Revolution, and during the winter of 1776-77 was occupied by the British.

NEWBURGH. A city in Orange County, N. Y., 60 miles north of New York City; on the Hudson River, about five miles above the picturesque Highlands, and on the Erie and the West Shore railroads (Map: New York, F 4). It is built on a steep, terraced slope, rising about 300 feet above the river to an extended plateau. The city has a public library, a public park, Saint Luke's Home and Hospital, Home for the Friendless, and Home for Children. The river here expands into Newburgh Bay, giving the city a deep water front and exceptional facilities for traffic by water. There is a trade in agricultural and dairy products, and large quantities of coal from Pennsylvania are here transferred to barges and coasting vessels. Newburgh is of considerable importance as an industrial centre, having manufacturing of cottons, woollens, silks, paper, powder, flour, felt hats, and carpet; shipyards; foundries and machine shops; tanneries and leatherette works; and plaster works. The government, as provided by the charter of 1898, is vested in a mayor, elected biennially; a common council; and administrative officials, the majority of whom are appointed by the executive, either absolutely or with the consent of the council. The city clerk, however, is elected by the council, and the water commissioners, board of education, and almshouse commissioners are chosen by popular vote. The water-works are owned and operated by the municipality. Population, in 1890, 23,087; in 1900, 24,943. The first settlement at Newburgh was made in 1709 by German Lutherans from the Rhenish Palatinate, who named it the 'Palatine Parish by Quassaic.' By 1750 most of the Germans had been replaced by people of English and Scotch descent, who in 1752 changed the name to the 'Parish of Newburgh' (after Newburgh, Scotland). Newburgh was the headquarters of the American Army from March, 1782, until the latter part of 1783, and it was here that the Newburgh Addresses were cir-

culated, that the army was disbanded, and that Washington received the famous Nicola letter, proposing that he become King. The 'Hasbrouck House,' then occupied by Washington, is now owned by the State and used as a museum for Revolutionary relics. On the grounds is the 'Tower of Victory,' an imposing stone structure erected by the United States and State governments to commemorate the close of the war. Newburgh was incorporated as a village in 1800 and was chartered as a city in 1865. Consult: Ruttenber, *History of the Town of Newburgh* (Newburgh, 1859); Powell (editor), *Historic Towns of the Middle States* (New York, 1899); Nutt (comp.), *Newburgh* (Newburgh, 1891).

NEWBURGH ADDRESSES. Two anonymous letters that appeared in 1783, after the close of the Revolutionary War. They urged some organized action to redress the wrongs of American soldiers, especially the withholding of their pay, and were later found to have been written by General John Armstrong.

NEWBURN. A town in Northumberland, England, on the Tyne, $5\frac{1}{2}$ miles west of Newcastle. Population, in 1891, 8000; in 1901, 12,500.

NEWBURY. A municipal borough and market town in Berkshire, England, on the Kennet, 17 miles southwest of Reading (Map: England, E 5). Trade in agricultural produce and malting are the principal industries, and an annual wool market is held. The chief buildings are the church, built in the reign of Henry VII., and the Corn Exchange. The town owns real estate, markets, and the gas works. It dates from the Roman period, and was a gift of the Conqueror to Ernulf de Hesdin. Newbury is best known for two hard-fought but indecisive battles between the Royalists and Parliamentarian forces in September, 1643, and in October, 1644. On the battlefield is a handsome memorial to Lords Falkland, Sutherland, and Carnarvon, Royalists, who fell in 1643. Population, in 1901, 11,061. Consult Money, *History of Newbury* (Oxford, 1887).

NEWBURYPORT. A city, including several villages, a port of entry, and one of the county-seats of Essex County, Mass., 37 miles northeast of Boston; on the Merrimac River and on the Boston and Maine Railroad (Map: Massachusetts, F 2). Among the city's noteworthy buildings and objects of interest are the public library of 40,000 volumes, Marine Museum, Putnam Free School, Anna Jaques Hospital, Old Ladies' Home, Home for Destitute Children, the Old South Church, containing the remains of George Whitefield, the house in which William Lloyd Garrison was born, the Dexter House, a statue of Washington, Washington Park, and a chain suspension bridge. The harbor, opening into the Atlantic Ocean, is safe and spacious. The principal manufactured products include boots and shoes, cotton cloths, celluloid collars and cuffs, silverware, electric car works, machinery, hats, and combs; and there is some shipbuilding, formerly a very extensive and important industry. Newburyport is also a distributing centre for coal. Under the original charter of incorporation of 1851, the government is administered by a mayor, annually elected, and a bicameral council, of which the Upper House is elected on a general ticket and the Lower

by wards. The municipality owns and operates the water-works. Population, in 1890, 13,947; in 1900, 14,478.

Newburyport was settled about 1635, was a part of Newbury until 1764, when it was separately established and incorporated as a town, and was chartered as a city in 1851. It was the home of Theophilus Parsons and the birthplace of Francis C. Lowell, who introduced cotton manufacturing on a large scale into the United States. Consult: Smith, *History of Newburyport, Mass.* (Boston, 1854); and Hurd, *History of Essex County, Mass.* (Philadelphia, 1888).

NEW CALEDONIA, kâl'e-dô'nl-â. An island in the Pacific, belonging to France, the southernmost of the Melanesian Islands. It is situated 1200 miles southeast of New Guinea, 850 miles from the coast of Queensland, and about the same distance from New Zealand (Map: Australasia, J 5). It is elongated in shape, extending from northwest to southeast, with a length of 240 miles, an average width of 30 miles, and an area of 6584 square miles. It is almost entirely surrounded by a coral reef, which is five to fifteen miles from the shores, and affords a belt of well-protected navigable water inside. The coast itself is indented with numerous bays, forming, especially on the southwestern side, many excellent harbors. The interior is very mountainous. There are two parallel ranges running the entire length of the island and inclosing a longitudinal valley between them. They are of nearly uniform height, except in the south, where they are broken by marshy lowlands. The highest point is an unnamed peak near the northwest coast, with an altitude of 5570 feet. Mount Humboldt in the southeast is 5360 feet high. The rocks are composed chiefly of serpentine, gneiss, schists, and limestone. There are no active volcanoes, but some evidences of ancient volcanic activity, including thermal springs. The rivers are all short, only one being navigable (25 miles).

The proverbially healthful climate is both drier and cooler than that of the other Melanesian Islands. Perpetual spring reigns. The rainfall (70 inches) is sufficient to sustain a very rich flora, although large areas are semi-arid pine barrens in which the *Araucaria Cookii* is prominent. True forests appear chiefly in the northern part, and contain much valuable timber, though sandal-wood has now practically disappeared. The fauna, like that of all other Oceanic islands, is very poor in varieties, a single species of bat being probably the only indigenous mammal, while reptiles are also few. The avifauna is the richest, and is related to that of the Australian continent rather than to that of New Zealand. The natives of New Caledonia, whom the French style Canaques ('Kanakas'), are Melanesians, probably of mixed (Papuan-Polynesian) type. The coast tribes seem to be better shaped and more regularly featured than the rest. They are above the average in stature, with dolichocephalic head-form. The absence of large animals on the island has made them practically vegetarians, but it may account in part for the cannibalism which once prevailed in this part of the world. One of their most interesting institutions is the pilu-pilu, or yam-harvest dance, with its mock fight. Something like the 'duk-duk' society of New Britain exists among them. Among other things worthy of note are their beehive huts,

grotesque carvings of heads, and sling-stones. The bow seems to be little employed, the spear and club being preferred. Traces of ancient aqueducts are reported to have been discovered in some parts of the island. Numerous petroglyphs and rock-carvings exist, some of which are considered pre-Kanaka. Since New Caledonia has been made a French penal colony, some admixture between the Europeans and the native women has taken place. Some of the tribes of the interior are still little known. The Webias of Central New Caledonia, who still live in a state of independence, and have not yet been seriously influenced by the whites, are said to be good-natured people and skillful fishermen.

The natives are the best agriculturists of all the Oceanic tribes, and irrigate the soil by means of aqueducts. They have even succeeded better than the white farmers, as the latter have been embarrassed for lack of labor, though they have imported Chinese and New Hebrides islanders. The natives live on reservations from which whites are excluded, but they are rapidly decreasing in number—50 per cent. in the last fifty years. The chief agricultural products are coffee, maize, tobacco, sugar, grapes, and pine-apples. Wheat and cotton have also been introduced. The mineral wealth is considerable, including gold, silver, lead, copper, nickel, cobalt, chromate of iron, and coal. The last six are mined, and the nickel output is the most valuable, amounting in 1899 to 74,614 tons of ore, valued at about \$800,000. The commerce is considerable, amounting in 1899 to about \$4,000,000, including imports and exports. Of the latter the principal are minerals, canned meats, and coffee. A railroad is under construction from Nouméa, the capital, to Bourail (90 miles).

The island with its dependencies, the isles of Pine, Wallis, Futuna, and Alafi, and the Huon and Loyalty Islands, is administered by a military governor, who is assisted in civil matters by a privy council. The colony is chiefly used as a penal settlement, and convicts constitute the majority of the white inhabitants. In 1898 the total population was 52,756, of whom 5585 were free colonists, 1762 officials, 1714 soldiers, 7477 convicts under sentence, 2515 liberated convicts, 1829 Asiatics, and 31,874 natives.

The island was discovered by Cook in 1774. In 1843 the French flag was raised, but the act was disavowed, owing to protests from England. Ten years later, however, the French took formal possession in order to put a stop to the cannibalism and excesses committed by the natives. In 1864 the penal settlement was founded, and after the Franco-Prussian War thousands of Communists were deported hither, most of whom have now returned to France. The natives have always been suspicious of the whites, and in 1878 rose in revolt, massacring many of the colonists.

NEW CASTLE, kâs-tel'. The southern part of Castile (q.v.).

NEWCASTLE. A city of New South Wales, situated at the mouth of the Hunter River, 102 miles north-northeast of Sydney, with which it is connected by rail and by steamers (Map: New South Wales, F 3). It is a well-built town with paved streets and fine public buildings. It is the principal port for the northern part of New South Wales, and is the greatest coaling port in the Southern Hemisphere. There are twenty-five collieries in the district, employing about 7000 persons. The wool trade is also large. Newcastle has some five miles of wharves, at which vessels of the largest tonnage may load and discharge. The area of the harbor, which is protected by two forts and two breakwaters, is 540 acres. The width of the channel at the entrance of the harbor is 1200 feet, and the depth of water on the bar $25\frac{1}{2}$ feet, and of the harbor 27 feet at high and 23 feet at low water. The industries of Newcastle include a steam biscuit factory, copper-smelting works, a brewery, shipbuilding yards, foundries, carriage factories, and a boot factory. It is the seat of a United States consul, and owns its gas and electric lighting plants and water-works. Population, in 1891, 13,000; in 1901, 14,250.

NEWCASTLE. A city in New Castle County, Del., six miles south of Wilmington; situated on the Delaware River, at the head of Delaware Bay, and on the Philadelphia, Baltimore and Washington railroad (Map: Delaware, P 2). New Castle has a good harbor and regular steamship connection with Philadelphia and Baltimore, is the centre of an agricultural and fruit-growing region, has large shad-fishing interests, and manufactures iron pipe, woolen and cotton goods, shirts, flour, and bricks. The city possesses several buildings of historic interest, a public library of 6000 volumes, and two parks. Under the charter of 1875, the government is administered by a mayor, chosen every three years, and a unicameral council, elected at large. Settled by Swedes in 1640, New Castle was held successively by the Swedes, Dutch, and English, and was the landing place of William Penn in 1682. It was incorporated first in 1875. Population, in 1890, 4010; in 1900, 3380.

NEW CASTLE. A town and the county-seat of Henry County, Ind., 41 miles east-northeast of Indianapolis; on the Blue River, and on the Lake Erie and Western, the Cleveland, Cincinnati, Chicago and Saint Louis, and the Pittsburgh, Cincinnati, Chicago and Saint Louis railroads (Map: Indiana, D 3). The town is surrounded by a farming district and has a supply of natural gas, and is an industrial centre of importance. The leading manufactures include tin, sheet iron and steel, bridge works, iron and brass beds, pianos, agricultural machines, furniture, handles, shovels, carriages, bricks, paper boxes, flour, etc. The water-works and street lighting plant are owned by the municipality. Population, in 1890, 2697; in 1900, 3406.

NEWCASTLE. A city and the county-seat of Lawrence County, Pa., 50 miles northwest of Pittsburgh; at the junction of the Shenango and Neshannock rivers, and on the Erie, the Pennsylvania, the Pittsburgh and Lake Erie, the Pittsburgh and Western, and the Western New York and Pennsylvania railroads (Map: Pennsylvania,

A 3). It is the commercial centre of a fertile agricultural region, which has also rich deposits of bituminous coal, limestone and sandstone, fire clay, and iron ore, and is noted for its extensive manufactures of iron, glass, fire brick, steel wire nails, boilers, machinery, tin plate, stoves, plows, lumber products, flour, paper, etc. The Y. M. C. A. maintains a library; and the city has a beautiful place of resort in Cascade Park, owned by the traction company. Settled in 1812, New Castle was chartered as a city in 1869. The government, under a charter of 1889, is vested in a mayor, chosen every three years, and a bicameral council, of which the Upper House (Select Council) confirms the executive's appointments of the heads of administrative departments. Population, in 1890, 11,600; in 1900, 28,339.

NEWCASTLE, HENRY PELHAM FIENNES PELHAM CLINTON, Fifth Duke of (1811-84). An English statesman. He was educated at Christ Church, Oxford, and represented South Notts in Parliament from 1832 to 1846, when he was ousted by the influence of his father, the fourth Duke, for supporting Sir Robert Peel in his free-trade measures. In the brief Conservative Administration of 1834-35 he had been a Lord of the Treasury, and First Commissioner of Woods and Forests in the Peel Administration, from 1841 to 1846. He was then made Chief Secretary to the Lord Lieutenant of Ireland, but went out of office with his chief a few months afterwards. He succeeded to the dukedom in 1851, and returned to office in 1852, filling the post of Secretary of State for the Colonies (which formerly included the Department of War) in the Aberdeen Government. The war with Russia broke out, and in June, 1854, it was found necessary to create a Secretary of State for War, and the new office was assigned to Newcastle. The sufferings of the British army before Sebastopol in the winter of 1854 raised a storm of popular discontent, and when the House of Commons determined to inquire into the conduct of the war, the Duke resigned, though the system, not the Minister, was to blame. Newcastle was reappointed Secretary of State for the Colonies in the second Administration of Lord Palmerston, 1859. In 1860 he accompanied the Prince of Wales during a tour in Canada and a portion of the United States, and on his return received the Order of the Garter from the Queen. Though his administration was meeting with general approval, failing health compelled him to resign, and he died a few months later on October 18, 1864.

NEWCASTLE, MARGARET, Duchess of. See CAVENDISH, MARGARET.

NEWCASTLE, THOMAS PELHAM-HOLLES, First Duke of (1693-1768). An English statesman. He was educated at Westminster School, and for a short time attended the University of Cambridge. He gave considerable aid to the House of Brunswick on the death of Queen Anne, and as a result various honors were conferred on him, and in 1715 he was created Duke of Newcastle. In 1724 he became Secretary of State for the southern department in Walpole's coalition Administration, and by aiding now one party and then another, as it best suited his interests, he remained in office almost continuously for thirty-eight years. In 1754 Newcastle became Prime Minister. He was in power at the be-

ginning of the hostilities of the Seven Years' War (q.v.), but affairs were mismanaged completely, and in November, 1756, Newcastle resigned. Pitt now took charge of the war and foreign affairs. In 1757 a Newcastle-Pitt Ministry was formed, Pitt being the virtual head. In 1762 Newcastle was forced out of office by Lord Bute, and thereafter was of little importance, though during the short Rockingham Administration, formed in 1765, he filled the office of Privy Seal. He died November 17, 1768. Newcastle seems to have had much of the absurd and grotesque in his character. Consult: Coxe, *Pelham Administration* (London, 1829); Cobbett, *Parliamentary History* (London, 1806-20); Carlyle, *Frederick the Great* (London, 1888); Stanhope, *History of England from the Treaty of Utrecht to the Treaty of Versailles, 1713-83* (London, 1851-54); Lecky, *History of England in the Eighteenth Century* (London, 1878-90).

NEWCASTLE, WILLIAM CAVENDISH, Duke of. An English statesman. See CAVENDISH, WILLIAM, Duke of Newcastle.

NEWCASTLE-UNDER-LYME, *ltm.* A Parliamentary and municipal borough in Staffordshire, England, 15 miles northwest of Stafford (Map: England, D 3). Its chief buildings are the town hall and high school, with which is incorporated the free grammar school, founded in 1602. The quaint red sandstone tower of the restored parish church dates from the twelfth century. The town has greatly improved in modern times; it owns remunerative real estate, gas, markets, and free library, and provides technical instruction, and maintains a sewage farm, cemetery, and isolation hospital. Hats were formerly the principal branch of manufacture, but the making of army clothing is now the chief industry. Newcastle-under-Lyme is surrounded by famous potteries, and coal-mines are worked in the vicinity. Of Saxon origin, the town was named after a castle built by Henry I. near the great forest of Lyme. The town received its first charter from Henry II. in 1175. Population, in 1801, 18,450; in 1901, 19,914.

NEWCASTLE-UPON-TYNE, *tin.* An episcopal city and municipal county of England, capital of Northumberland, on the left bank of the Tyne, eight miles from its mouth (Map: England, E 1). The town stands partly upon an elevated plateau and partly upon the north bank of the river. The river is crossed by three bridges, which connect Newcastle with Gateshead (q.v.)—the High Level Bridge, the Redheugh Bridge, and a swing bridge (completed in 1874 at a cost of nearly £500,000). The High Level Bridge is one of the engineering triumphs of Robert Stephenson. The length of the viaduct is 1337 feet, and the height of the railway above high-water mark, 112 feet. It has a broad carriageway, by which the ordinary traffic avoids the precipitous streets on both sides of the river, with passenger paths on each side, and the railway above.

The Church of Saint Nicholas is a noble edifice, chiefly in the Decorated style. In the Guildhall, an old and somewhat inconvenient building, situated beside the river, the town assizes are opened and the quarter sessions held. Under the Guildhall proper there is an exchange for the merchants, ship-owners, and brokers of the quayside. In the Moot Hall, a modern, handsome

Grecian building overlooking the swing-bridge, the town and county assizes are held. The spacious town hall, a modern building, stands on a block of ground facing Saint Nicholas Church; associated with it are a corn market and offices for the transaction of the town business. The market for the sale of meat and vegetables is one of the most spacious and commodious in the kingdom. All the railways entering the town terminate in a large station near its centre. The jail, a heavy and costly building, occupies a low and confined situation. The postal and telegraph office is one of the largest and finest of the public buildings in the town. There are two theatres—the Royal (the ornament of Grey Street, the handsomest street in the town), and the Tyne Theatre in Westgate Street. Among the educational institutions are a natural history museum, a public library, a literary and philosophical society, society of antiquaries, a natural history society, mechanics' institute, and an institute of mining engineers. The colleges of medicine and science are both connected with the University of Durham. A column surmounted by a statue of Earl Grey, to commemorate the passing of the Reform Bill, and a bronze statue to George Stephenson are the principal monuments in the city.

Of benevolent institutions there are an infirmary, a dispensary, asylums for the blind, the deaf and dumb, and two orphanages. The municipal property is valued at \$15,000,000, and consists of real estate, markets, street railways, and quays. The municipality maintains baths, wash houses, free libraries, cemeteries, and dust destructors, and indirectly contributes to technical education; important domestic utilities such as gas, water, etc., are provisionally monopolized by companies. Extensive improvements have modernized the older portions of the town, and the streets generally are wide, well paved and well lighted. The trade of Newcastle consists chiefly in coal from the Northumberland and Durham regions, of which it is the great centre. Large quantities of lead, the produce of the mines of Alston Moor and Weardale, are brought to Newcastle for manufacture, and a large quantity of unrefined lead is also imported from Spain.

At Newcastle the railway system had its origin, and its locomotive and engineering works are among the largest in England. The ordnance works of Sir William Armstrong at Elswick, the western part of Newcastle, are well known. Iron shipbuilding and various branches of engineering are extensively carried on, and since 1882 several men-of-war have been constructed on the Tyne. Newcastle occupies an important position in the manufacture of soda, bleaching-powder, vitriol, salt, and other chemical products. Earthenware is largely manufactured, and glass-staining has reached great perfection. The firebrick trade has attained large proportions, and there are important manufactures of gas-retorts and sanitary pipes, which are sent all over the world. Immense numbers of grindstones are exported. Portland and other cements are manufactured in vast quantities.

The river Tyne from the sea to Newcastle forms a natural dock for the accommodation of shipping, and for ten miles both banks are lined with quays, docks, and factories. It has four natural docks, the largest nearly a mile long, and

including two piers at its mouth; £3,250,000 have been spent on the improvement of the Tyne. The entrance and many parts of the river have been deepened by dredging, and, though eight miles from the mouth of the Tyne, the tidal river is as much a port for Newcastle as the Thames is for London. An average of 15,000 vessels annually enter and clear at the Tyne ports, which comprise Newcastle and North and South Shields, with a gross tonnage of 16,000,000. The value of exports, consisting chiefly of iron, copper, lead, alkali, and machinery, averages \$60,000,000 annually; and imports, including fruits, grain, butter, sugar, metals, and petroleum, average \$50,000,000. The total exports from Newcastle to the United States amount to about \$20,000,000. It is the seat of a United States consul.

Newcastle dates from the Roman Pons Ælii—one of the chain of forts by which the wall of Hadrian was fortified. On the withdrawal of the Romans, the deserted camp became the residence of a colony of monks, and the town was called Monkchester. Robert, eldest son of William the Conqueror, commenced to build a castle here in 1079 or 1080. Hence the modern name of New Castle. William Rufus finished his brother's castle, surrounded the town with a wall, and gave the inhabitants peculiar privileges. The present castle, which displays better than any other in England the genius of Norman military architecture, was erected by Henry II. between the years 1172 and 1177. Newcastle being made the rendezvous of the vast armaments which the first three Edwards led into Scotland, it was in their time surrounded with new walls of unusual strength and magnitude; portions of them yet remain. During the Civil War it declared for the King, and sustained a ten months' siege by the Scots. The coal trade dates from the reign of Henry III. In 1615, 400 colliers cleared the port, one-half to supply London. Lords Stowel, Eldon, and Collingwood, Mark Akenside, and Hutton, the mathematician, were natives of Newcastle. Intimately connected with it, though not born in it, were Thomas Bewick, the engraver; Robert Morrison, the Chinese scholar; and George and Robert Stephenson. Population, in 1801, 28,400; in 1851, 87,800; in 1891, 186,300; in 1901, 214,803. Consult Rendel, *Newcastle-on-Tyne: Its Municipal Origin and Growth* (London, 1898).

NEW CHURCH. See SWEDENBORGIANS.

NEW COLLEGE. A college at Oxford, England, originally known as the College of Saint Mary of Winchester. It was founded by William of Wykeham, Bishop of Winchester, and sometime Lord Chancellor of England, in 1379 for a warden, 70 fellows and scholars, 10 chaplains, 3 clerks, and 16 choristers. The college was but a part of Wykeham's plan, which included also the establishment of the famous school at Winchester, the first of the English public schools, from whose numbers the scholars of New College were to be chosen. To this new feature in English education was added also the beginning of a tutorial system in the college, by which the ordinary university instruction was supplemented by the work of the fellows of the college with the younger scholars. In the buildings of his college, Wykeham founded the school of English college architecture, and the buildings remain to-day

the finest of the early colleges. In every way, this foundation was the most splendid of its time, but, owing chiefly to certain curious exemptions from university supervision in examinations (cf. King's College, Cambridge), it did not play the part that might have been expected of it during most of its history. Here Vitelli taught Grecyn Greek, and thus gave the college a very real connection with the new awakening. It is to-day, in scholarship and athletics, one of the leading colleges in Oxford. The establishment, as fixed by statutes of 1855 and 1881-82, consists of a warden, 22 fellows, 3 chaplains, 40 scholars, college officers, a choir, with a total of some 250 undergraduates. The connection with Winchester School is still maintained very closely. The buildings are of great beauty, particularly the hall and the chapel, with windows designed by Sir Joshua Reynolds, and an imposing tower. The gardens, which include in their limits part of the old city wall of Oxford, are among the most attractive in Oxford. The college presents to 40 livings. Among the worthies of New College have been Archbishop Chichele, founder of All Souls' College, Bishop Waynflete, founder of Magdalen College, Bishops Ken and Lowth, and Sydney Smith. See KING'S COLLEGE, Cambridge; WINCHESTER; OXFORD UNIVERSITY; WILLIAM OF WYKEHAM.

NEWCOMB, nŭ'kom, SIMON (1835—). An American astronomer and mathematician, born in Wallace, Nova Scotia. He was educated in his father's school and came to the United States in 1853. A year afterwards he began teaching in Maryland, and in 1857 was appointed computer on the *Nautical Almanac* at Cambridge. In 1858 he graduated at the Lawrence Scientific School, and in 1861 was appointed professor of mathematics in the United States Navy. He negotiated the contract for and supervised the construction of the 26-inch equatorial telescope at the Naval Observatory. He was secretary of the Transit of Venus Commission in 1871-74, observed the transit of Venus at the Cape of Good Hope in 1882, and directed several eclipse expeditions, beginning in 1860. In 1877 he became senior professor and director of the *Nautical Almanac*, a position which he held till he was retired on account of age in 1897. He was professor of mathematics in Johns Hopkins University in 1894-1901 and editor of the *American Journal of Mathematics*. Newcomb became a member of nearly all the Imperial and Royal Societies of Europe and of the various scientific associations of this country. He was also made an associate of the Institute of France, and an officer of the Legion of Honor, being the first American since Franklin to be so honored. He was president of the American Association for the Advancement of Science in 1877, of the Society for Psychological Research in 1885-1886, of the Political Society of America in 1887, of the American Mathematical Society in 1897-1898, and of the Astronomical and Astrophysical Society of America, from its foundation in 1899; vice-president of the National Academy of Sciences in 1883-89, and was chosen president of the Saint Louis Congress of Arts and Sciences. He received the Copley (1874), the Huygens (1878), the Royal Society (1890), and the Bruce medal (1898); and numerous other prizes and honorary degrees from societies and universities in this country and Europe. In addition to scientific attainments he wrote on finance and po-

litical economy, and delivered a course of lectures at Harvard University on kindred topics.

NEWCOMBE (nū'kom) **MEMORIAL COLLEGE.** See **TULANE UNIVERSITY.**

NEWCOMEN, nū-kōm'en, **THOMAS** (1663-1729). An English blacksmith, inventor of the atmospheric steam engine, a prototype of the modern machine. He was born at Dartmouth, and, it would seem, had addressed himself to the task of devising a practical engine before 1698, when Savery took out his patent. Possibly Newcomen had forged the larger parts of Savery's engine—they lived only fifteen miles apart. But it is certain that Savery shared in the patent taken out by Newcomen about 1710. The part played by John Calley is uncertain; probably he was only a grazier who advanced Newcomen money. Newcomen's engine is described and pictured in a copper engraving dated 1719; it was a combination of preceding machines and an improvement on all of them, in that it was a complete change of type, the various elements of boiler, condenser, and engine pump being divided among so many separate parts, which, with the exception of the condenser (the present form of which is due to Watt), are essentially the same as those of the modern engine. Newcomen's was the first practical machine, and it was successfully and commonly used for pumping.

NEWCOMES, nū'komz, **THE.** A novel by W. M. Thackeray (1854-55). The character of Colonel Newcome is one of the finest delineations of a simple-minded, pure-hearted gentleman in fiction, and is said to have been drawn from the author's stepfather, Colonel Smyth.

NEW CONNECTION METHODISTS. See **METHODISM.**

NEW CONNECTION OF GENERAL BAPTISTS. See **BAPTISTS.**

NEW CUM'BERLAND. A town and the county-seat of Hancock County, W. Va., 33 miles north of Wheeling; on the Ohio River, and on the Pittsburg, Cincinnati, Chicago and Saint Louis Railroad (Map: West Virginia, D 1). It is chiefly engaged in the manufacture of pottery (semi-porcelain), fire and paving brick, sewer pipe, and tiling, the adjacent region having valuable clay deposits. There are also coal mines, a foundry, and mills for the pulverization of fire clay for use in iron works. Population, in 1890, 2305; in 1900, 2198.

NEW DECATUR, dē-kā'tūr. A city in Morgan County, Ala., 25 miles west by south of Huntsville; on the Tennessee River, just above Decatur, and on the Louisville and Nashville and the Memphis and Charleston railroads (Map: Alabama, B 1). It is developing rapidly as an industrial centre, being noteworthy for iron manufactures. According to the census of 1900, capital to the amount of \$1,349,000 was invested in the various industries, which had a production valued at \$2,977,000. New Decatur was settled in 1887, and was incorporated in 1889. Under a revised charter of 1899 the government is vested in a mayor, elected every two years, and a unicameral council. Population, in 1890, 3565; in 1900, 4457.

NEW DONGOLA, dōp'gō-lā. A town of the Egyptian Sudan. See **EL-ORDEH.**

NEWELL, nū'el, **PETER** (1862—). An American illustrator, born near Bushnell, McDonough County, Ill. He worked for a time as photographer and maker of crayon portraits in Jacksonville, Ill., and later studied at the Art Students' League in New York City. Afterwards he settled at Leonia, N. J., and contributed constantly to various current publications. His work in flat tones was a later development of his original talent, and became very popular through the ingenious *Topsys and Turveys* (1893-94); *A Shadow Shown* (1896); and *Peter Newell's Pictures and Rhymes* (1899); volumes for which he furnished the text himself. He also produced the clever and grotesque illustrations for John Kendrick Bangs's *House-Boat on the Styx*, *Pursuit of the House-Boat*, and *Mr. Munchausen*; Lee's *Tommy Toodles*; Stockton's *The Great Stone of Sardinia*; Mark Twain's *Innocents Abroad*; and Lewis Carroll's *Alice in Wonderland* and *Through the Looking Glass*.

NEWELL, **ROBERT HENRY** (1836-1901). An American humorist, born in New York, December 13, 1836. His reputation was made during the Civil War by newspaper sketches and letters over the name 'Orpheus C. Kerr' (Office Seeker). These letters were collected in four volumes (1862-68). Newell also wrote romances and several volumes of verse. His humor lightened the toil of Lincoln, and it was genuine though not excellent.

NEW ENGLAND. The collective name of the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut. It has an area of 67,384 square miles, and had a population, in 1900, of 5,592,017.

Leif Ericson is believed by many to have sailed along the coast of New England as early as 1000 A.D., and it is in New England that the mythical city, Norumbega (q.v.), is generally supposed to have been located. The coast seems to have been visited by Verrazano in 1524, and was to a considerable extent explored by Sir Humphrey Gilbert in 1583, by Gosnold in 1602, by Sir Martin Pring in 1603, and by George Weymouth in 1605. By the charter of 1606 the Plymouth Company was empowered to make settlements in what was then called 'North Virginia'; but an attempt (1607), by a company under George Popham, to found a settlement on what is now the Maine coast, failed. In 1614 Capt. John Smith sailed along the coast, and also went for some distance inland up several of the rivers. He prepared a description of his voyage and a rough map of the coast, and suggested the name 'New England' for the region. Beginning with 1620, when the Plymouth colony was established in the present Massachusetts, settlers gradually came into New England, and in 1643 the colonies of Connecticut, New Haven, Massachusetts Bay, and Plymouth united to form a confederacy known as the United Colonies of New England, the first attempt at federation made in America. Each colony was to choose two commissioners, and the eight commissioners thus chosen were to hold annual sessions at Boston, Hartford, New Haven, and Plymouth, and were to take action with reference to various matters of common interest to the four colonies. In 1663 the meetings became triennial. Meetings were held as late as 1684, though in the last years little was accomplished. Of the pres-

ent New England States Connecticut resulted from the union of the colonies of Connecticut and New Haven, and Massachusetts from the union of the colonies of Massachusetts Bay and Plymouth, while both New Hampshire and Maine were originally under the jurisdiction of Massachusetts, Maine not receiving a separate organization until 1820. See articles on the various States and the historical section of the article UNITED STATES.

NEW ENGLAND HISTORIC AND GENEALOGICAL SOCIETY, THE. An association incorporated in 1845 in Boston, Mass., for historical research in regard to the family histories of the early settlers in New England, and the collection of old records. The society began the collection of a library which now contains 30,000 volumes and as many pamphlets, chiefly upon the subject of New England history and biography, and has also a collection of relics and curios, manuscripts, and many old portraits and oil paintings. It now has a membership of a thousand, and holds monthly meetings. In 1847 the society began the publication of a quarterly magazine, *The New England Historical and Genealogical Register*, and also publishes the *Biblioplist*, for circulation among its members, giving the proceedings and necrology of the society.

NEW ENGLAND PRIMER, THE. One of the most famous school-books in the history of education. Yet it is uncertain when it first appeared, and of the 2,000,000 copies that it is reasonable to suppose were printed and sold in the eighteenth century, less than 50 survive, representing, however, some forty editions. Much has been done to clear up the bibliography of the work by Paul Leicester Ford in *The New England Primer: A History of Its Origin and Development, with a Reprint of the Unique Copy of the Earliest Known Edition, and Many Facsimile Illustrations and Reproductions* (New York, 1897). The compiler of the work was shown by Ford to have been Benjamin Harris, an English printer and rhymester, who during the Catholicizing reign of James II. came to Boston and set up a book, coffee, tea, and chocolate shop 'by the Town Pump near the 'Change.' Here some time before 1690 he first issued the *Primer*, an abridgment of another compilation, *The Protestant Tutor*. A fragment of this first edition, or of a second, soon after, was found used as waste in the binding of a book printed in 1688, and is known as "The Bradford Fragment." The *Primer* was changed from time to time to suit not only religious, but political feeling, though in general through the eighteenth century the tendency was strongly religious. The most familiar quotation from the *New England Primer* is doubtless the nursery prayer, "Now I Lay Me Down to Sleep," but many couplets from the rhymed alphabet are still remembered. The composition of the different editions varies greatly. The earliest is thus made up: (1) Title; (2) Godly Admonitions; (3) Alphabet and Syllabary; (4) Rhymed Alphabet; (5) The Dutiful Child's Promises; (6) An Alphabet of Lessons, Texts of Scripture; (7) Choice Sentences; (8) The Lord's Prayer, Creed, and Ten Commandments; (9) The Duty of Children. Texts; (10) Hortatory Verses; (11) Names in Order of Biblical Books; (12) Roman and Arabic Numerals,

from 1 to 100; (13) John Rogers's Exhortation to His Children; (14) The Shorter Catechism. The more noteworthy features of other editions are: John Cotton's "Spiritual Milk for American Babes," a still shorter catechism, and a "Dialogue Between Christ, Youth, and the Devil."

NEW ENGLAND THEOLOGY. The name given to a distinct school of Calvinistic theology, originating in New England, and characterized by modifications of the older theology in respect to the nature of God; the freedom, ability, and responsibility of man; the nature of moral action; and the constitutive principle of virtue. The originator of the school was Jonathan Edwards (q.v.). With Edwards and his immediate successors the general aim was to combat Arminianism. In 1770 John Murray (q.v.) arrived in New England and began to preach Universalism, and thus introduced a new element into theological thought and controversy. (See UNIVERSALISM.) The early decades of the nineteenth century were occupied with the Unitarian controversy and with discussion of the teachings of Dr. Taylor of New Haven, particularly concerning sin, depravity, and regeneration. The outcome was the adoption of the principles which have since been known as the New England theology, and which may be stated in the propositions that all sin is voluntary; that through the connection with Adam there is in man a sinful propensity which renders it certain that every man will sin from the beginning of moral action; that, though man has complete freedom of will, as a fact, he never turns to God without the previous regenerating operation of the Holy Spirit, which persuasively turns him to repentance and holiness; that holiness is disinterested love; that election is the choice, for reasons lying in the knowledge of God alone, of certain persons, without regard to their own merits, as the recipients of such gracious influence as shall certainly secure their repentance. During the past half century theological thought in New England, as elsewhere, has been profoundly influenced by German philosophy and historical criticism and by the theory of evolution. As a consequence the New England theology as a distinct school has become a thing of the past, and the unmodified doctrines of the older leaders are no longer taught in the Congregational seminaries. Among those prominent in developing and defending the teachings of the school, after Edwards (1703-58), may be mentioned: Joseph Bellamy (1719-90); Samuel Hopkins (1721-1803); Jonathan Edwards, the Younger (1745-1801); Stephen West (1735-1819); Samuel West (1730-1807); Nathaniel Emmons (1745-1801); Timothy Dwight (1752-1817); Nathaniel W. Taylor (1786-1858); Leonard Woods (1774-1854); Moses Stuart (1780-1852); Edwards A. Park (1808-1900); Henry B. Smith (1815-76); Horace Bushnell (1802-76); Samuel Harris (1814-99). Consult: Fisher, *History of Christian Doctrine* (New York, 1896); Walker, *History of the Congregational Churches in the United States* (New York, 1894); Boardman, *New England Theology* (New York, 1899). See also CONGREGATIONALISM; and the biographical notices of the leaders.

NEW FOREST. A forest region in the southwestern part of Hampshire, England, with an area of 92,000 acres (144 square miles) (Map: England, E 6). The name dates from the Nor-

man Conquest, when the district was afforested and protected by severe laws by William the Conqueror. It is a Crown possession managed by the Court of Verderers as a public pleasure ground.

NEWFOUNDLAND, nu'fünd-land'. A British colony in North America, comprising the island of Newfoundland and its dependency, Labrador. The island lies across the entrance to the Gulf of Saint Lawrence between latitudes 46° 35' and 51° 40' N., and between longitudes 52° 35' and 59° 25' W. It is separated from the eastern extremity of Labrador in the north by the Strait of Belle Isle, 10 miles wide, while Cabot Strait separates it from Cape Breton Island, 65 miles to the southwest. Newfoundland is that part of North America which lies nearest to Europe, its distance from Valentia in Ireland being 1640 miles. It is roughly triangular in shape, measuring 317 miles from Cape Ray, its southwestern, to Cape Norman, its northernmost point, while the distance from Cape Anguille in the extreme west to Cape Spear in the east is 316 miles. The total area of the island is 42,200 square miles. The coastline is extremely irregular, being indented with numerous large bays studded with countless islands, and ramifying into narrow fiords which run far into the interior. In the southeast the Bay of Placentia and Trinity Bay run in from opposite sides of the island, cutting off the Avalon Peninsula, which is connected with the mainland by a very narrow isthmus. In the northwest there is a corresponding peninsula, though less detached, known as Le Petit Nord, at the head of which the coast is deeply indented by White Bay. Many of the bays form commodious and well-sheltered harbors with deep water close to shore.

TOPOGRAPHY. The coasts are nearly everywhere bold and rugged, presenting a line of rocky cliffs from 200 to 400 feet high, broken by the fissures which form the entrances to the fiords. In the Bay of Islands on the west coast, the small rocky islets are 1000 feet high, while the shores of the bay rise in Blomidon Cliff to a sheer height of 2125 feet from the water's edge. The interior is an undulating plateau of moderate elevation traversed by a number of ridges which terminate in the headlands, and which, like all the chief physical features, river valleys, headlands, and geological formations, run diagonally across the island from southwest to northeast. The principal ridge is the Long Range, which runs along the entire western coast, and has numerous peaks from 1500 to 2000 feet high. Avalon Peninsula is rugged and hilly, and scattered over the interior plateau are a number of isolated peaks known as 'tolls.'

HYDROGRAPHY. Newfoundland has an abundance of lakes, ponds, and streams. The principal rivers flow toward the northeast coast, except the Humber, which breaks through the Long Range and enters the Bay of Islands. The largest stream is the Exploits River, which flows through a chain of long lakes stretching almost across the island, its length being 200 miles. The rivers, however, cannot be used as means of communication except as canoe routes for hunters. The largest lake is Grand Pond, 56 miles long, with an area of 192 square miles, and there are several others almost equaling this in size.

CLIMATE. The winters are not as cold, nor are

the summers as warm as in Canada, the annual extremes of temperature being 7° and 83°. The Arctic current, which skirts the eastern coast, and the east winds, which drive the floating ice into the bays along that coast, prolong the winter and spring, and render the climate here raw and chilly in winter and cool in summer. The moisture-laden east winds, moreover, bring frequent fogs.

GEOLOGY AND MINERALS. The bulk of the island consists of Archæan rocks, among which the Huronian system predominates in the southeastern third, and the Laurentian in the remainder of the island. There are, however, beds of Paleozoic and Lower Mesozoic, reaching as far as the Lower Carboniferous system. These are found chiefly in the troughs forming the river valleys, the valley of the Exploits following a bed of Upper Silurian rocks, 20 miles wide. The chief mineral is copper, while some lead and silver and a little gold have been found. There are large beds of gypsum on the western coast, and a small coal field exists near Saint George's Bay.

SOIL AND FLORA. Large portions of the interior consist of marshes, and there are barren areas of rock covered with lichens and low shrubs of pine and larch. Some parts, however, are heavily timbered, especially at the heads of the bays, and along the river valleys. The latter also afford large tracts of good arable land. The principal trees are white and yellow pine, white, black, and red spruce, fir, tamarack, birch, and red maple. Among the wild animals are the black bear, wolf, and several species of fox.

AGRICULTURE AND MINING. Although there are probably 5,000,000 acres of land on the island suitable for agriculture, only 64,494 acres had been improved in 1891. Since that time the Government has offered a bonus for cleared land, and the area under cultivation now amounts to about 100,000 acres, located almost wholly along the southeast coast. The principal crops are potatoes and turnips; hay and oats are also raised. The most important mineral exploited is copper, the output of which has increased considerably in recent years. The value of the exports of copper ore in 1900 was \$816,170. Pyrites and iron ore follow with a combined value of \$415,764.

FISHERIES. Fishery far exceeds all other occupations, and the only manufactures worthy of mention are subsidiary to the fisheries, such as the manufacture of cordage, biscuits, etc. More than 50,000 inhabitants of Newfoundland are engaged in the fisheries, and the fishing fleet in 1900 consisted of 1449 vessels and over 20,000 boats. The fisheries on the Grand Bank (q.v.) have declined, and are no longer important for Newfoundland, whose inhabitants are engaged chiefly along the coast and off the coast of Labrador. Along the west coast of the island, known as the French Shore (see *History* below), the French still enjoy the exclusive right to fish, and the United States enjoy similar rights on the southwestern coast. The cod-fisheries are the most important, the quantity caught annually in the waters of Newfoundland being valued at \$9,000,000, about two-thirds of which are caught by Newfoundland fishermen. Next in importance come the seal, lobster, herring, and salmon fisheries. Seal fishing is conducted from steamers which enter the solid drift ice upon which the

COPYRIGHT, 1883, BY DODD, NEAD & COMPANY.

young seal are suckled by their mothers. The number of seal has lately declined, and the season for hunting has been restricted by law to one month, from March 16th to April 16th. The values of the fishery products exported from Newfoundland in 1900 were as follows: Dried cod, \$5,446,067; cod oil, \$301,091; seal skins, \$162,005; seal oil, \$433,011; canned lobster, \$441,593; pickled herring, \$146,611.

COMMERCE AND COMMUNICATIONS. Trade is chiefly with Great Britain, Canada, and the United States. In 1901 the total imports were valued at \$7,287,200, and the exports at \$8,125,920. The chief imports are flour and other food products, textiles, and hardware. Communication between the coast settlements is still effected chiefly by water, there being few roads, and practically none in the interior except the transinsular railroad. The transinsular railroad was completed in 1897, and with its branch lines had, in 1899, a length of 638 miles. There were also in that year 1314 miles of telegraph lines.

POPULATION. The total population of the colony in 1901 was 220,249, of whom 3634 resided in Labrador. In 1891 the total population was 202,040, of whom 4106 were in Labrador. There is practically no immigration, 97 per cent. of the population being native born, chiefly of English, Irish, and Scotch descent. The population is almost wholly concentrated on the southeast coast, the interior being practically uninhabited, and the west coast barred by the French treaty rights. The capital and largest town is Saint John's, with a population of 29,594, and only four other towns. Harbor Grace, Carbonear, Bonavista, and Twillingate, have populations exceeding 3000.

EDUCATION AND RELIGION. In 1900 34 per cent. of the population were Roman Catholics, 33 per cent. belonged to the Church of England, and 27 per cent. were Methodists. The schools are wholly denominational. The school funds are proportioned according to the number of pupils of each denomination, and there are three superintendents of public instruction—one for each denomination. Education is not compulsory, but the public schools are well attended; there are very few private schools. Higher education is given through four colleges which prepare students for the examinations of the London University.

GOVERNMENT. The executive power is vested in a Governor appointed by the Crown and a Ministry or executive council of nine members, responsible to the majority of the Lower House of the Legislature. The latter consists of a council of not more than fifteen members, and an Assembly whose members are elected by manhood franchise. The public revenues in 1901 were \$1,953,720, and the expenditures \$1,952,748. The public debt was \$16,891,902. The colony, like Canada, has adopted the dollar as the unit of currency.

HISTORY. Newfoundland was discovered by John Cabot in 1497, but the English did not take advantage of the discovery for nearly a century. In the meantime the cod-fisheries attracted numerous Portuguese, Spanish, and French fishermen. In 1583 Sir Humphrey Gilbert took formal possession of the island for the British Crown, but various attempts at settlement were defeated by the French. English fishermen, however, frequented the shores in increasing numbers.

By the Treaty of Utrecht in 1713, France conceded the absolute sovereignty of England over the whole territory of the island. She retained, however, the neighboring islets of Miquelon and Saint Pierre as stations for her fishing fleets, and reserved the exclusive right to the cod-fisheries on the western coast, including the right to build such temporary structures on land as were necessary for curing the fish. Even after the English acquisition, however, the prosperity of the island was delayed for a century by the repressive measures adopted by the home Government, influenced by the mercantile and fishing interests, which desired the island simply as a place for drying fish during the season, to be left barren and uninhabited when the fishing season was over. Settlements were practically forbidden, no titles to land were granted until 1813, and until 1820 no house could be built without a license, while the government of the island was practically left in the hands of the fishing captains. In 1832 Newfoundland finally received a representative government giving the control of its affairs to its inhabitants. In recent years the question of the French treaty rights on the west coast has reached an acute stage. The French interpretation of the treaty, acquiesced in by the British home Government, prevented the settlement and exploitation of the west coast by inhabitants of Newfoundland. Two attempts to arrange a convention between the French and the British governments were vetoed by the Newfoundland Government, which furthermore passed an act cutting off the local supply of bait from the French fishermen. The French Government retaliated by ordering the confiscation of all fishing implements belonging to foreigners found fishing on the west coast, and it later claimed the right to confiscate the Newfoundland lobster factories which had been established there, although the treaty referred only to cod-fishing. In 1890 a temporary settlement was arranged by the *Modus Vivendi* Act, by which the French and Newfoundland establishments then existing on the shore should be left undisturbed, but no more Newfoundland lobster factories could be built until a final settlement could be reached.

(ib., 1901); Willson, *The Truth About Newfoundland, the Tenth Island* (2d ed., ib., 1901).

NEWFOUNDLAND DOG. This, one of the largest, handsomest, and most intelligent of dogs, named from the island whence he was first introduced to European notice, offers, in his present characteristics, something of a puzzle as to his origin. He is not an aboriginal Newfoundlander. The dog of the native Beothuks was that of the adjacent mainland (Labrador), used mostly for hauling sleds, and it had a double coat of the warmest and thickest hair, the

hairs protruding through an undercoat of short and fluffy fur, or 'wool.' From early in the sixteenth century French, Spanish, Portuguese, and English fishermen frequented the shores of Newfoundland in ever-increasing numbers. The presence of so relatively great a foreign population, all arriving in short periods, overtaxed the capability of the native dogs to meet the demand, and, exactly as happened later in Alaska, the first settlers took into the island 'outside dogs,' among which were undoubtedly some of the big dogs of Spain, where the mastiff, the bloodhound, and a ferocious variety of pointer were then common. These crossed miscellaneously with the Indian dogs, but the pointer especially seems to have introduced into the double-coated native his color, size, intelligence, and keen scent, all qualities well marked in the Newfoundland dog as he came into European knowledge at the end of the eighteenth century. So highly was he then esteemed for his wonderful retrieving powers, that he was almost entirely exported, and his breed in the land of his home almost eliminated. Inquiries made in 1890 showed that, except in one or two outlying islands, none remained in Newfoundland. Fortunately, the breed has been maintained in Great Britain and in America, from the original stock.

The Newfoundland is a massive dog, 27 inches high at the shoulder, and often weighing 100 pounds. In color he is almost always black and white, or all black, although when first imported many were brown and white; and he has a dense coat of coarse texture and oily nature, able to resist water, for which this breed has a passion. If the coat be brushed the wrong way it should fall back into its place naturally. His head is broad and massive; his fore legs perfectly straight, his hind legs very strong with great freedom of action; his feet large and well shaped; his ears small, set well back and lying close to the head. His eye is small and deeply set, but does not show any haw. Consult authorities cited under Dog.

NEWGATE. A famous London prison, established at the 'new gate' of the city, probably near the beginning of the twelfth century. The earliest authentic mention of it dates from 1218, when it was repaired by order of the King. It was repaired and enlarged in 1638, and wholly rebuilt after the great fire of 1666, which had partially destroyed the old building. In 1770 work was begun on the reconstruction of the prison. The work was hardly finished when the prison was sacked during the 'Lord George Gordon riots.' In 1857-59 the internal structure of Newgate was changed, so as to provide separate cells for prisoners, who had formerly been permitted to mingle with each other. In 1902 the building was demolished.

In the early centuries of its existence Newgate was used for almost every class of prisoners—prisoners of State, Jews charged with child murder, regicides and forestallers, debtors, as well as for ordinary criminals. The prisoners endured a most wretched existence. If they possessed property, they were subjected to the limitless rapacity of their jailers; if without property, they had to rely upon alms for food. Frequently they were detained for years before securing a hearing on the charges upon which they had been committed to prison. These conditions remained practically unchanged in the sixteenth and seven-

teenth centuries, when the prison began to be crowded with a new class of inmates, those who adhered to proscribed religious creeds. Henry VIII. and Mary, and in later years of her reign, Elizabeth, made use of Newgate as a place of detention for those who were to be tried for heresy or popery, as the case might be. It was in Newgate that such prisoners were tortured in the hope of their recantation, or to force them to implicate others. John Rogers and Hooper were among the more famous of the prisoners of this class.

With the cessation of religious persecution, Newgate was again occupied chiefly by felons awaiting execution, of persons awaiting trial on criminal charges, and of debtors. The condition of its inmates was evil both from a moral and a sanitary point of view. Those who were guilty of mere misdemeanors were permitted to associate with the most hardened criminals, with the result that many not originally inclined toward professional crime became involved in the plots of the professional criminals. This evil was aggravated after 1780, when Newgate became the regular place of detention of felons condemned to transportation. After 1815 debtors were no longer confined in Newgate. Sanitary conditions were even worse. From the Middle Ages Newgate had been noted for its epidemic diseases—the 'jail distemper,' probably a form of typhus fever, being a frequent malady. In 1414 sixty-four prisoners had died of this disease; and its ravages were common down to the end of the eighteenth century. In 1752 an attempt was made to check the evil by the employment of mechanical ventilation, but with small success. In the early part of the nineteenth century philanthropists began to interest themselves in the moral and sanitary conditions of Newgate. Effective reform did not take place, however, until after 1840. After 1849 convicted prisoners were removed to a new prison in Holloway, and Newgate remained, until its demolition, almost exclusively a place of detention for prisoners awaiting trial. Consult Griffiths, *Chronicles of Newgate* (London, 1884).

NEW GLASGOW, glās'kō. A manufacturing town of Pictou County, Nova Scotia, Canada, on the East River and on the Nova Scotia Railway, 8 miles southeast of Pictou Landing on Northumberland Strait, with which it is connected by a branch line. It is the centre of an important coal and iron mining district with their supplemental industries; there are also ship-building yards, glass factories, tanneries, etc. Population, in 1891, 3776; in 1901, 4447.

NEW GRANADA, grā-nā'dā. The old name for the Republic of Colombia (q.v.).

NEW GUINEA, gīn'ē, or PAPUA. A large island north of Australia, from which it is separated by Torres Strait. It is surpassed in size only by Greenland. Borneo is a little smaller, and Madagascar about three-fourths as large. Its area is estimated at 313,183 square miles, or almost exactly that of Texas and Louisiana together. It lies on the extreme western side of the Pacific Ocean between latitude 0° 19' and 10° 43' S. and longitude 131° 12' and 150° 48' E. Its length is nearly 1500 miles, its greatest width over 400 miles, and its longer axis extends from northwest to southeast. The larger portion of the island west of longitude 141° has been claimed by the Dutch since 1828; the eastern

portion is divided between the British on the south and the Germans on the north, their territories having been defined respectively in 1884 and 1886.

TOPOGRAPHY. The waters on the south of the island are so shallow that if the sea floor were elevated 300 feet New Guinea would form a part of Australia and the Louisiade Archipelago in the southeast would be a part of the mainland. Oceanic depths encircle the island on the other sides. Around it are scattered a considerable number of islands, some of which were undoubtedly torn away from the greater land mass. In many places the coast is fringed with coral reefs and islands, most of them covered with vegetation. The vastness of the island, together with the marshy coastlands and dense forests and jungle, hindered exploration and white enterprises till the last decades of the nineteenth century. The interior has not been adequately explored, and most of the western half of the island, under the Dutch flag, is still unknown except along the coasts. There are a sufficient number of indentations on the coasts to provide excellent harbors as the country develops. Port Moresby, with a population of 1000 natives and 10 Europeans, has wharves for shipping, and is the seat of government and the chief port of Southeastern New Guinea (British New Guinea); Samarai and Daru, islands near the mainland, provide the other ports for this colony. Friedrich Wilhelmshafen is the most important port of the northeast of the island, or Kaiser Wilhelmshafen (German New Guinea), and vessels trade at a few points in Western New Guinea, the half of the island which is possessed by the Netherlands.

A large part of the coasts are fronted by low and marshy plains suitable for rice-growing; but the interior is very rugged and so densely covered with tropical vegetation that progress is extremely difficult, excepting along a few rivers. Nearly everywhere paths have to be cleared with hatchets, and a mile of advance is often a hard day's work; under such circumstances exploration has been very slow; but the sum total of the work of many explorers has given a fair idea of the interior, excepting in Dutch New Guinea.

Through the eastern half of the island stretches range after range of mountains extending from northwest to southeast, the eastern ranges culminating in the Owen Stanley Mountains, whose highest peaks, Mount Victoria (13,200 feet) and Mount Albert Edward (13,000), are supposed to be the loftiest elevations of British New Guinea. The eastern mountains are of igneous origin, the central masses schistose, and the western ranges chiefly sandstone. The parallel chains of the Kaiser Wilhelmshafen ranges are also stupendous and may be seen far out at sea long before the coast lands come into view. The two lofty peaks of the Bismarck range are supposed to be from 15,000 to 20,000 feet high, probably the highest summits in New Guinea. It is thought that the German mountains may be the eastern prolongation of great ranges in Dutch New Guinea still unexplored. The geological structure of the German mountains has not yet been studied. Lofty mountains, some of them 10,000 feet high, fringe long stretches of the north coast of Dutch New Guinea; and farther south the long range of the Charles Louis Mountains extends far

east with elevations of 12,000 to 16,000 feet, some of them said to be covered with snow, though this statement is not authoritatively reported. The Dutch coast mountains appear to be of tertiary limestone excepting the Cyclops, which are of volcanic origin; the great mountains of the interior are chiefly composed of slates and sandstones. Everywhere between the mountains extend wide or narrow plains filled with high grass or dense jungle and scrub.

HYDROGRAPHY. The central mountain ranges form the water parting between rivers flowing to the south and the north. Navigation may be developed more extensively than on most of the great islands of the world. The largest river is the Fly, which, rising on the British-German border, has a course of 620 miles to the Papua Gulf and may be ascended by steam launches for 500 miles. The Purari, farther east, is navigable by steamboats for 120 miles. The Kaiserin Augusta River in Kaiser Wilhelmshafen has been ascended by a sea-going steamer for 180 miles. The Otilia is navigable, and it is believed the Marga will be useful as a means of transportation. Little but the mouths of the Dutch rivers can yet be laid down on the maps, but the depth and breadth of some of the outlets indicate important streams.

CLIMATE. As the island lies just south of the equator, the climate is hot in the lower altitudes, with a small annual range and an average temperature of about 79° F. The climate is usually agreeable at elevations of 3500 feet and water freezes during the night at 10,000 feet. Rain falls nearly every week in the year, but the quantity is subject to large variation, the precipitation at Port Moresby, for example, averaging 37 inches a year, while that of Samarai, farther east, is 126 inches, and at Daru, farther west, 82 inches. Malarial fever of a mild type is common on the lower grounds, but the climate away from the swamps is not inimical to the health of white men. The dense vegetation found everywhere shows the great natural fertility of the soil.

FLORA. The rich flora is transitional between that of the Malay Archipelago and that of Australia. It varies with altitude and climate. Many varieties of grass and flowers are found even on the tops of the high mountains. The great forests of the south are chiefly cypress, cedar, and ebony. In Kaiser Wilhelmshafen there is a great variety of cabinet timber, banyan trees, tangled vines, and the rarest of orchids. The gutta-percha tree has recently been discovered, and the Germans intend to cultivate this valuable commodity. The cultivated plants are rice, sugar, maize, yams, bananas, breadfruit, and other tropical products. The massoi tree supplies spices, medicines, and dyes, and the prospects of the rubber industry are promising. The natives make cloth from the bark of the paper mulberry and other trees, and obtain fibre from the banana, cocoanut, and the aerial roots of the pandanus. Some of the aborigines live exclusively on sago, others on yams and taro, and bananas or sweet potatoes are the staple food of other tribes. There is no agriculture in our sense of the word, except that the Germans have introduced tobacco and cotton farming with some success. It is expected that coffee, tea, and vanilla will ultimately be valuable crops.

FAUNA. Wild swine are common, but there

are no dangerous carnivora. The crocodiles in the rivers cause some loss of life, and there are many poisonous snakes. On the whole, the fauna is poor in quadrupeds, which include the phalanger, echidna; and rodents, and among the marsupials the wallaby and tree kangaroo. The bird of paradise is preëminent among the birds, including fourteen of the eighteen known varieties, and all those of the most magnificent plumage. Other birds include the cassowary, pigeon, emeu, hornbill, cockatoo, geese, ducks, quail, snipe, and woodcock. The capture of the trepang or *bêche-de-mer*, in about twenty varieties, affords an important industry off the coasts. There is considerable trade in turtle-shell, pearls, and pearl-shell.

GEOLOGY. Although the geological structure of the island has not yet been adequately investigated, important discoveries of gold have been made in British New Guinea—alluvial gold on the eastern islands and along the Mambare and other streams, and auriferous reefs on Mount Scratchley and in other places. Prospecting has scarcely more than begun, but the gold-bearing region seems to be extensive, and mining is almost the only industry of the white men in British New Guinea, the number of miners varying from 100 to 1000 men, who are meeting with some success and some disappointment. Gold has also been found in the Bismarck range of Kaiser Wilhelmsland.

COMMERCE. The trade of the island is still very small. The incoming of miners into British New Guinea has increased the commerce of that colony, which now amounts to over \$500,000 a year, about equally divided between imports (chiefly foodstuffs, tobacco, cloth, and hardware) and exports (copra, pearl shell, gold, pearls, and sandal wood). Nearly the entire trade of this possession is with Queensland and New South Wales, about 400 small vessels a year entering and clearing the ports. The colony is treated as a postal district of Queensland, the postal movement being about 20,000 letters and 13,000 newspapers a year. The German New Guinea Company has a concession placing in its hands the development of Kaiser Wilhelmsland with stations along the coast at Friedrich Wilhelms-hafen, Konstantinhafen, Finschhafen, and Stephansort. The few plantations yield export tobacco and cotton, and the natives barter copra, trepang, and mother-of-pearl. Several steam and sailing vessels owned by the company connect the ports with Bremen. Dutch New Guinea has very little trade except along the coast, an occasional Dutch war vessel supplying the needs of the trading and missionary posts.

GOVERNMENT. British New Guinea (estimated area, 90,540 square miles; population, 358,000) is a Crown colony with an administrator and a legislative council. The expenses of administration, about \$75,000 a year, are guaranteed by the Commonwealth of Australia, which practically monopolizes the trade. The revenues are from \$50,000 to \$60,000 a year, chiefly from customs duties. A company called the British New Guinea Syndicate has a concession of 250,000 acres of land, best suited for cultivation, and has begun to develop systematic planting. Land is offered to settlers at 2s. 6d. an acre. Native labor is in ample supply, and the natives are improving under the British policy of gradually making them more useful to themselves and

foreigners without depriving them of their inherited rights and social usages.

The German New Guinea Company maintains a court of law in each section of the colony of Kaiser Wilhelmsland (estimated area, 70,843 square miles; population, 110,000). The revenues are still very small, the expenditures being about three times as great; the deficit is covered by a Government subvention. Dutch New Guinea (estimated area, 151,800 square miles; population, 238,000) belongs to the Residency of Ternate, Molucca Islands, and is one of the outposts. A Dutch official (*Controleur*) has charge of the Government interests, but very little is done for the country excepting to protect the few white stations and prevent intertribal wars along the coast.

POPULATION. The total population, estimated at 706,000, is very thinly spread over the island. The dense forests have had the effect to keep the small tribes apart and to make them suspicious of one another. Near the British settlements many of them are beginning to speak English, and it is found that they are best controlled by native policemen in the pay of the Government. While they often make war upon one another, they have offered no important opposition to the ingress of the whites. Many of them are cannibals, and a few white men have been killed by members of tribes addicted to eating human flesh.

ETHNOLOGY. The term 'Papuan,' which is of Malay origin (*papáwah*, 'frizzled'), is applied by modern ethnologists to the type of man found in its greatest purity in certain parts of New Guinea (often called 'Papua') and some small islands to the east and west of it. Some writers use 'Papuan' and 'Melanesian' as equivalent terms, but most authorities divide the negro-like race in question into a Papuan proper and a Melanesian section. It would seem best to restrict the term Papuan to the assumed autochthones of the great island of New Guinea and the peoples closest akin to these. Physically, the Papuans are of rather short stature, dolichocephalic, frizzly-haired, dark-skinned. This general type is not, however, without variations due to Malay, Melanesian, Negrito, and Polynesian influences. The Papuans are, as a rule, sedentary, with pile-dwellings about the coast, and may be said to be in the 'Stone Age.' Tree-dwellings, especially for purposes of refuge, are common. The Papuans generally are good fishermen, boat-users, and boat-builders, but not farers into the open sea like the Malays and Polynesians. Their characteristic vessel is the one-trunk canoe. In matters of government they seem to be less communistic than the Australians, for private property in a number of things (land, fields, houses, besides ornaments and weapons) exists, while the general tone is quite democratic, subjection to chiefs being rather a matter of popular recognition than of individual imposition. Shamanism is, however, a powerful factor. The position of woman varies in diverse parts of the Papuan domain, but is generally not low. In disposition and temperament the Papuans vary from the less energetic and very hospitable peoples of German New Guinea like the Varopu, to the savage and warlike tribes of some regions of the British territory and the cannibals of various sections. The Papuans are an imaginative people, and possess numerous myths and an abundant folk-

lore; they possess a remarkable form-sense, and are skillful in ornamental work. Their art has been treated by Prof. A. C. Haddon, in his *Evolution in Art* (London, 1895). The religion of the Papuans includes ancestor-worship, shamanism, 'temple-cults,' and spiritism. Among their customs are head-hunting, vendettas, secret societies, and the *duk-duk* of New Britain. In intellectual ability the Papuans are ranked above the Australians and below the African negroes. The chief Papuan tribes of New Guinea are the peoples about Geelvink Bay and its islands; the Arfaks of the extreme western interior—the Karons of the Arfak Hills are by some said to be Negritos; the Onimes of Maclure Inlet, and farther south, the Kova; the Talandjang of Humboldt Bay; in German New Guinea the peoples of Astrolabe Bay, Finschhafen, the Bismarck Archipelago; in British New Guinea the tribes in the region of the Fly River (Daudai, Kiwai, etc.), and the Gulf of Papua (Orokolo, Toaripi), the tribes of the southeastern interior (Koitapu, Kupele), the Moresby region and the terminal peninsula (Kerepunu, Loyalupu, Aroma, Massim), the peoples of the Entrecasteaux and Louisiade archipelagoes (Samarai, etc.). Papuans are also to be found on the Aru group and the islands of Salawatti, Waigu, etc., to the northwest of New Guinea, and there are probably Papuan elements in the population of the Ke and Tenimber islands, and some slight traces elsewhere in Malaysia.

HISTORY. The name Guinea, derived from the name of a large negro kingdom, Ganuya, was applied by the Portuguese in the fifteenth century to the territory of the Senegal in West Africa. The Spanish explorer Íñigo Ortiz de Rez in 1545 gave the name New Guinea to the large island north of Australia on account of the physical resemblance of its inhabitants, in his opinion, to the natives of West Africa. The island was seen and reported by Dabreu in 1511, but the first European to land was Menezes in 1526, when he named it Papua after the local designation of the natives. During succeeding centuries it was visited by most of the Polynesian explorers despite the efforts of the Dutch to bar the passage to lands beyond their Molucca Islands. From 1815 to 1873 several Dutch and English hydrographic expeditions surveyed the coast, and Dutch and English missions were established respectively at Geelvink Bay and the Gulf of Papua. The inhabitants were divided into a number of petty independent tribes, over whom feudatory rights were claimed by the Moslem chiefs of small neighboring islands. The presumed rights of one of these, the Sultan of Tidore, were acquired by the Dutch and led to their expedition of annexation in 1828. In 1883 the Ministry of Queensland, Australia, proclaimed the annexation to that colony of the eastern half of New Guinea; the British Government promptly disavowed the act, but in 1884 established a protectorate over the south coast. A short time after the British occupation of the south coast, the German Government took possession of the north-east, together with the Bismarck Archipelago.

NEWHALL, nŭ'hŭl, CHARLES STEDMAN (1842—). An American naturalist and author of juvenile books. He was born in Boston; studied at Amherst (1869) and at the Union Theological Seminary; soon left the ministry for educational work; and then became United States assistant special forest agent and superintendent of the forest reserves of northern and central California. Newhall wrote: *A History of Fall River, Mass.* (1862); various juveniles, including: *Harry's Trip to the Orient* (1885) and *Ruthie's Story* (1888); and the following works on botany: *Trees of Northeastern America* (1892); *Shrubs of Northeastern America* (1893); *Leaf Collector's Handbook and Herbarium* (1892); and *Vines of Northeastern America* (1897).

NEW HAMPSHIRE (popularly called the 'Granite State'). A North Atlantic State of the United States, belonging to the New England group. It lies between latitudes 42° 40' and 45° 18' N., and between longitudes 70° 37' and 72° 37' W. It is bounded on the north by the Cana-

dian Province of Quebec, on the east by the State of Maine and for a distance of 18 miles by the Atlantic Ocean, on the south by Massachusetts, and on the west by Vermont, from which it is separated by the Connecticut River. Its general shape is that of a right triangle with the right angle at the southeastern corner and the acuter apex pointing north. Its extreme length is 178 miles, its extreme width 88 miles, and its area 9305 square miles, of which 9005 square miles, or 5,763,200 acres are land surface. It ranks fortieth in size among the United States.

TOPOGRAPHY. New Hampshire is relatively more rough and mountainous than the average State on the Atlantic slope. The easternmost extension of the Appalachian system traverses the State lengthwise, running first as a ridge along the western boundary on the east bank of the Connecticut River, and culminating in the rugged mass of monadnocks known as the White Mountains. These cover about 1300 square miles in the north-central part of the State, and constitute a region of romantic scenery. Among the peaks, whose naked, rocky summits reach above the timber-line, the highest is Mount Washington, with an altitude of 6293 feet. Several isolated monadnocks, outlying members of the group, are scattered over the southwestern quarter of the State, the most prominent being Mount Kearsarge, 2943 feet high, and Mount Monadnock, with an altitude of 3186 feet. North of the White Mountains, in Coos County, another elevation rises to a height of over 2000 feet, and extends indefinitely into Maine and Canada. The southeastern part of the State is generally low, being relieved by numerous 'drumlins'—rounded hills of glacial drift generally covered with boulders. Every part of the State is well drained by numerous streams, the narrow western portion by the Connecticut River, the remainder by rivers flowing to the Atlantic Ocean. The northern part of the State is drained by the Androscoggin River, which issues from Lake Umbagog, and after making an irregular detour to the west flows into Maine. The Saco also enters that State after draining the eastern group of the White Mountains. The principal river of the State after the Connecticut is the Merrimac, whose main fork, the Pemigewasset, rises in the Franconia or western group of the White Mountains. It flows southward in a series of falls and rapids, furnishing enormous water power. It has been said that the Merrimac turns more spindles than any other river in the world. The lower course of this river is in Massachusetts. Finally, the southeastern corner of the State is drained by the streams flowing into the Piscataqua estuary, this being the only harbor on the coast. Like all glaciated areas, New Hampshire abounds in lakes—irregular, beautiful sheets of water studded with wooded islets. The largest is Lake Winnepiseogee, 16 miles long and 6 miles wide. Other notable lakes are Umbagog, in the north on the Maine boundary; Squam, northwest of Winnepiseogee; and Sunapee and New Found Lake, in the west.

CLIMATE. The climate is strongly affected by the elevation of the land. It is colder, on the average, than that of Maine, and the winters are severe, the ground being usually snow-covered and the rivers frozen from autumn to spring. The lower Merrimac Valley is the warmest part of the State. It is of slight elevation and but lit-

tle affected by ocean breezes. Here the mean temperature for January is 21°, and for July 70°, the corresponding figures for the northern portion being 16° and 67°, and for Mount Washington 5° and 47°. The climate is quite humid, and the precipitation sufficient all over the State. It is especially abundant on the mountain summits, where it reaches 55 inches, and on the eastern slope of the mountains, where it ranges from 40 to 46 inches. It is least near the seashore and on the western slope, where there is a fall respectively of only 35 and 30 inches. The whole State is, as a rule, very healthful.

For flora and fauna, see paragraphs under UNITED STATES.

GEOLOGY. New Hampshire consists almost exclusively of ancient crystalline rocks, a fact which has earned for it the title of "Granite State." The main formations run lengthwise through the State parallel with the coast and the Connecticut River. The eastern or New Hampshire bank of the latter and a broad band along the coast are composed of rocks mainly of the Huronian series. Between these, through the centre of the State, the predominant formation consists of Montalban and other gneisses together with calciferous mica-schists in the north. The structure is, however, complicated by extensive outcrops of still older rocks. A line of granites and diorites appears near the coast west of the Piscataqua, and through the centre of the State, running west of the Merrimac Valley toward the White Mountains, there are extensive outcrops of porphyritic gneiss. The heart of the White Mountains themselves is composed mainly of granite. Few regions exhibit more well-marked evidences of glacial action than New Hampshire. The rocks are everywhere striated, and boulders of all sizes are scattered all over the State, even on the mountain summits. Moraines are also well marked; but, though there are deposits of glacial drift, and of fertile modified drift along the river valleys, the soils of the State are in general not encouraging to agriculture.

MINERAL RESOURCES. The most valuable mineral output of the State is derived from its non-metallic rocks. Up to 1900 New Hampshire ranked first in the production of mica, the output in that year being 191,118 tons. In 1901 it fell to 65,800 tons, and was exceeded by that of North Carolina. The production of granite in 1901 was valued at \$935,494. The celebrated Indian Pond and White Mountain scythestones are quarried in great quantities. Copper is mined to some extent, and ores of lead, zinc, tin, arsenic, iron, and some gold and silver are found.

FISHERIES. In the fishing industry New Hampshire is the least important of the New England coast States. Its commercial fisheries are confined to Rockingham County, on the Atlantic. The industry showed a considerable decline from 1889 to 1898. The value of the catch (1898) was \$48,987, as compared with \$88,511 nine years before. The most important catches in 1898 were haddock, cod, and lobsters. The 11 hatcheries of the State distributed in 1900 about 3,256,000 fry, mainly salmon, salmon trout, brook trout, and lake trout.

FORESTS AND FOREST PRODUCTS. The manufacture of lumber products is the oldest of the State's industries. It is claimed that the first sawmill in New England was established near Portsmouth in 1635. In 1900 the woodland was

estimated at 5200 square miles. Much of this is cut-over land, the primeval forests of white pine having almost disappeared. But there is an extensive area of second-growth white pine, some of which is merchantable. It is estimated that since 1850 1,764,609 acres (nearly one-third) of the farm land has reverted to unimproved land, most of which is growing up in white pine. The highest mountain slopes are still covered with primeval forests of spruce, the variety of wood most largely used in the manufacture of wood-pulp. The town of Berlin, in the Androscoggin Valley, claims to be the largest pulp-manufacturing centre in the country. The manufacture of this product increased 462 per cent. in the decade 1890-1900. The value of the lumber and timber products increased ninefold from 1850 to 1900, and nearly doubled in the last decade of that period. See table below.

AGRICULTURE. A large portion of the surface of the State lies too broken for agriculture. Only along the coast and in the river valleys is the soil rich and well adapted for farming. Latterly it has been cheaper to import cereals than to grow them in New Hampshire. The number of farms and their total acreage were but slightly greater in 1900 than in 1850, but the area of the improved acreage decreased over one-half during the half-century, amounting in 1900 to only 29.8 per cent. of the farm acreage. The most marked decline in the improved area was from 1890 to 1900. The average size of farms—123.1 acres—was about the same in 1900 as in 1860. Only 7.5 per cent. of the farms are rented. The cash system of lease is rapidly supplanting the share system. In the table below will be noticed the decided decrease in the cereal acreage from 1890 to 1900. Wheat and rye, both formerly of considerable prominence, have practically ceased to be cultivated. A considerable area of corn grown for forage or ensilage is not included in the table figures. As the cereals have decreased in importance much more attention has been given to vegetables, garden products, and fruits. In 1899 the potato crop was, after hay and forage, the most valuable farm crop. Apples are the chief orchard fruit, the number of trees in 1900 being 2,034,398. Many of the abandoned farms in New Hampshire are being acquired for summer homes by residents of cities.

STOCK-RAISING. With the changes in the system of agriculture dairying has become an im-

portant industry, and the number of dairy cows increased decidedly from 1880 to 1900. The value of dairy products for 1899 was \$5,591,272, of which 80.5 per cent. was realized from sales. The number of other cattle, by contrast, decreased

after 1850, and the number of sheep in 1900 was only about one-sixth as many as in the former year. The accompanying census figures are self-explaining.

MANUFACTURES. Manufacturing is the leading industry. The percentage of wage-earners engaged therein gradually increased during the last half of the nineteenth century, being 17.1 in 1900, or twice that of 1850. Of the 70,419 thus employed, 21,921 were women. The decade 1890-1900 witnessed the largest absolute gain in the value of products—\$118,669,308 in 1900. The southern part of the State possesses the advantage of being close to the business centre of New England, has a convenient harbor at Portsmouth, and shares with Massachusetts the excellent water power afforded by the Merrimac. The manufacturing interests accordingly are confined largely to this section of the State. The manufacture of cotton goods headed all industries until 1900. From its establishment in 1804 its growth has been steady. The water power of the Merrimac was largely the cause of the success of this industry, and determined the location of the two main cotton manufacturing centres—Manchester and Nashua. With the development of this industry in the Southern States latterly, the relative importance of New Hampshire is diminishing. The woolen industry was established in the first year of the nineteenth century. In 1900 the product was valued at a little less than half that of the cotton products. The woolen output decreased slightly during 1890-1900. Hosiery and knit goods are manufactured at Laconia, but in less quantities than formerly. The boot and shoe industry almost doubled the value of its product during 1890-1900, and acquired first rank among the industries of the State. The closely related tanning industry owes its development to the former abundance of the local supply of tanning bark. This branch reached its maximum in 1880, since when it has declined. The manufacture of flouring and grist-mill products is a long established industry, but the factory production of butter, cheese, and condensed milk is of recent though rapid growth. The table following shows the relative importance and condition of the ten leading industries.

TRANSPORTATION. The first railroad charter was granted in 1835. In 1850 the mileage amounted to 467 miles. This was increased to 1142 in 1890, and 1193 in 1900. The numerous small lines have been consolidated until in 1900 the lines were operated by three companies—the Boston and Maine, the Grand Trunk, and the Maine Central. The railroad built up Mount Washington in 1868 is a remarkable piece of engineering. In its steepest part it ascends 1980 feet to the mile. Portsmouth is a port of entry, but its foreign trade is insignificant.

BANKS. The first bank was the New Hampshire Bank, of Portsmouth, chartered in 1792 and until 1800 the only bank in the State. In the beginning of the nineteenth century several banks were established, which called forth special legislation, and as early as 1814 the State passed a law requiring annual reports from them. By 1835 there were twenty-five banks in the State, but in the financial panic of 1837 many suspended payment. In 1845 there were only seventeen banks, with a small aggregate capital, and a circulation of less than \$1,000,000.

In the next decade the banks recovered, and by 1863, when the national banking system was introduced, there were fifty-two State banks in operation, with a capital of almost \$5,000,000. By 1870 all but three banks had become national. State banks have remained unimportant since then. Private banks have been prohibited since 1799.

Trust companies appeared in 1885 and tried to do the business of both discount banks and savings banks. Six of them are in existence. Savings banks have always been numerous and popular. The two savings banks chartered in 1823 were among the first in the country. The savings banks deposits grew with special rapidity after the Civil War. About one-fourth of all the savings banks went into liquidation in the panic of 1893, and a bill was passed for their regulation in 1895, strictly limiting their investments. The act was further amended in 1901. In 1902 there were 147,928 depositors (one for about every 2.8 of the population), with an average deposit of \$407.29. The condition of the banks in the State in 1902 is shown in the following table:

	National banks	State banks	Savings banks
Number of banks.....	56	10	53
Capital.....	\$5,355,000	\$610,000	No capital
Surplus.....	1,500,000	131,000	\$3,348,000
Cash, etc.....	1,146,000	80,000	138,000
Loans.....	13,410,000	1,100,000	29,061,000
Deposits.....	13,449,000	1,418,000	60,249,000

FINANCES. Up to the beginning of the Civil War the debt of the State was insignificant, amounting to \$60,000 in 1860. The war expenditures made loans necessary, and their aggregate sum rose from less than \$1,000,000 in 1862 to \$4,236,000 in 1865. The total expenditures of the State treasury for war purposes were \$6,852,678, only \$897,122 of which were repaid by the Federal Government. The State debt was gradually reduced, and by 1872 amounted only

to \$2,205,695. In that year, however, the commonwealth assumed the Civil War debt of the towns and cities, which increased the State debt to \$4,138,124. The financial condition has been sound since then, and the debt is being reduced at the rate of from \$100,000 to \$200,000 a year. In 1878 a law was passed by the Legislature for taxation of railroads. In 1902 the total liabilities were \$1,669,071, out of which the State owed \$813,574 to trust funds, and \$839,200 formed the funded debt. The cash in the treasury on June 1, 1902, was \$575,612. The receipts for the fiscal year 1901-02 were \$1,389,332, derived as follows: 30 per cent. from a general State tax; 25 per cent. from a tax on savings banks deposits; 27 per cent. from tax on railroads; and the rest from miscellaneous sources. The disbursements were \$1,261,614, of which \$570,136 was returned to towns as their share of the railroad and savings banks tax.

GOVERNMENT. The present Constitution was adopted in 1877. The question of revising the Constitution is submitted to the people every seven years, and if approved by a majority of those voting, a convention for revision must be called. The right of suffrage is given to male citizens twenty-one years of age who have resided in one town six months. Paupers and persons excused from paying taxes are excepted.

LEGISLATIVE. Every town or place entitled to town privileges, and wards of cities having 600 inhabitants may elect one representative to the Lower House, and one additional representative for every additional 1200 inhabitants. Whenever the unit of representation contains less than 600 inhabitants, it is entitled to a representative such proportionate part of the time as the number of its inhabitants shall bear to 600. The State is divided into twenty-four districts, paying approximately equal portions of direct taxes. Each of these districts is entitled to one Senator. Representatives and Senators are elected biennially in November in open town meetings. The Legislature convenes on the first Wednesday of January. Money bills must originate in the

Lower House. Members 'seasonably attending' are paid \$200, exclusive of mileage.

EXECUTIVE. The Governor and the five members of the Governor's Council are chosen biennially in the month of November. The resolutions and advice of the Governor's Council are recorded, and may be called for at any time by either House of the Legislature. A two-thirds vote of each House overcomes the Governor's veto. The president of the Senate and the Speaker of the House are in the line of succession to the Governorship in case of vacancy. The pardoning power rests with the Governor, with the advice of the Council. The Secretary, Treasurer, and Commissary-General are chosen by joint ballot of the Senators and Representatives.

JUDICIARY. The Legislature erects and constitutes judicatures, courts of record, and other courts. Most judicial officers, including the Attorney-General, coroners, and registers of probate, are appointed by the Governor. Judicial officers serve during good behavior, except justices of the peace, whose terms expire in five years.

LOCAL GOVERNMENT. The laws of the State provide for the election in each county of a treasurer, register of probate, solicitor, sheriff, and register of deeds.

MILITIA. The population of militia age in 1900 was 88,149. The militia in 1901 numbered 1342.

POPULATION. The growth of the population is shown by the following figures: 1790, 141,885; 1820, 244,022; 1850, 317,976; 1860, 326,073; 1870, 318,300; 1880, 346,991; 1890, 376,530; 1900, 411,588. New Hampshire ranked 10th among the States of the Union in 1790, 22d in 1850, and 36th in 1900. The largest gain was made in the first census decade, and the population actually decreased in the decade 1860-70. The gain between 1890 and 1900 amounted to 9.3 per cent., as compared with 20.7 for the United States. Throughout the century the State contributed largely to the tide of Western migration, but this outflow has been offset in recent years by the increase in the immigration of foreigners, particularly French-Canadians, who constitute over half of the 88,107 foreign born returned by the census of 1900. The 15 towns exceeding each 4000 inhabitants collectively contain 46.7 per cent. of the total population. The density of population in 1900 was 45.7 per square mile. The State sends two members to the National House of Representatives.

CITIES. The population of the largest towns in 1900 was: Manchester, 56,987; Nashua, 23,898; Concord, 19,632; Dover, 13,207; Portsmouth, 10,637. The capital is Concord.

RELIGION. The Roman Catholic element amounts to about 10 per cent. of the total population of the State. The principal Protestant denominations are the Congregational, with about 20 per cent. of all the church members; the Baptist, with over 17 per cent.; and the Methodist, with about 12 per cent.

EDUCATION. A number of town schools were established in accordance with the law of 1847. Grants of land for educational purposes were made before the War of Independence. In 1769, 44,000 acres were granted for the establishment of a college, and in 1821 a law was passed appropriating for a literary fund the taxes from bank-

ing corporations. The illiterate population amounted in 1900 to 6.2 per cent. of the total population of ten years and over. Of the whole school population of 71,544 in 1900, there were enrolled 65,688. The average attendance amounted to 47,276, or about 72 per cent. of the total enrollment. The total number of schools fell off from 2644 in 1882 to 2198 in 1900, but the number of graded schools increased from 491 to 773 during the same period. The length of the school term was nearly 148 days in 1900, as compared with about 118 days in 1890. The school revenue for 1900 amounted to \$1,120,219, of which only \$15,707 was derived from the permanent school fund. From the State came \$55,519, and from local taxes, \$997,667. New Hampshire has only one State normal school (at Plymouth). Representing secondary education there were, in 1900, 57 public high schools, with a total attendance of 3700, and 33 private high schools and academies, with a total attendance of 2600. The institutions of higher education are Dartmouth College, at Hanover, and Saint Anselm's College (Roman Catholic), at Manchester.

CHARITABLE AND PENAL INSTITUTIONS. The State Board of Charity and Correction consists of five members appointed by the Governor and Council, and of the secretary of the State Board of Health. This board inspects all State and county charitable or correctional institutions, except the State prison and the asylum for the insane (both of which are located at Concord). The changes recommended by it must be made by the responsible officers. In 1902 there were 1203 children wholly or partially supported by public charity, 979 of them being in orphan asylums. There are 15 private orphan homes—7 Protestant and 8 Catholic—but in all but one of these, county or city children are boarded at public charge. There is a State industrial school for boys and girls, located at Manchester. In 1901 the State Legislature made appropriations for the erection of a State school for feeble-minded. During the year ending September 30, 1902, were accommodated in the almshouses of the State 1630 persons, of whom 687 were confined because of insanity, feeble-mindedness, or epilepsy. Drunkards and petty criminals are sometimes committed to the pauper institution, where they mingle freely with the other inmates. At the State prison the convicts are worked under the contract system, a fixed sum being paid per day per convict. The State has general control of the convicts.

HISTORY. The first explorer of this region was probably Martin Pring, who anchored in Piscataqua Harbor in 1603. It was included in the grant to the Council for New England in 1620, and this body on August 10, 1622, granted to John Mason and Sir Ferdinando Gorges all the land lying between the Merrimac and Kennebec for sixty miles inland, under the title 'Province of Maine.' The next year David Thomson settled at Little Harbor. In 1627 Edward Hilton settled at Dover Neck, and secured a patent later in 1629 or 1630. The province was divided November 7, 1629, and that part lying between the Merrimac and the Piscataqua fell to Mason. In November, 1631, Mason and Gorges, together with a number of merchants, received from the Council territory lying on both sides of the Piscataqua within the territory already granted to them. Several trading stations were founded, the most

important of which was Strawberry Bank (Portsmouth). Many settlers came out, but the proprietors derived little profit from the colony. When the Council dissolved in 1635, Mason was confirmed in all his grants and received 100,000 acres more west of the Kennebec. The settlement of Exeter was founded by Rev. John Wheelwright in 1638 after his expulsion from Massachusetts Bay. All these settlements were practically independent and with little form of organized government. Mason was a busy man who paid little attention to this province, which was named for his native Hampshire in England. Massachusetts Bay looked with disfavor upon the settlements of Royalists and Churchmen, and laid claim to the territory. In 1641 all the settlements except Exeter were joined to Massachusetts, and Exeter followed in 1643. Mason's grandson, Robert Tufton Mason, applied to the King for restitution of the territory granted to his ancestor. A decision that Massachusetts had usurped possession was secured in 1677, and in 1679 a decree declaring New Hampshire a royal province was issued, but Mason received little satisfaction. It remained a royal province until the Revolution, but its existence was dependent entirely upon the King's will, as no charter was issued. The Governor of Massachusetts was often commissioned the Governor of New Hampshire as well. After the expulsion of Andros in 1689 New Hampshire asked to be incorporated with Massachusetts, but was refused. The colony suffered greatly in the Indian wars of the eighteenth century, but nevertheless gradually extended its settlements north and west. Boundary disputes were frequent. The dispute over the southern and eastern boundaries was settled in 1740, but the question of the possession of Vermont was not settled until 1764. During the Revolution New Hampshire bore a conspicuous part. The Continental Congress, from which counsel was asked, advised the formation of a temporary State. A convention at Exeter, December-January, 1775-76, adopted a brief constitution. In 1779 a constitution was submitted to the people, but was rejected. A convention, June 12, 1781-October 31, 1783, framed a new constitution, which was ratified and went into effect June 2, 1784. Another convention, September 7, 1791-September 5, 1792, drafted a third constitution, which was ratified during the session of the convention. This provided that the question of the expediency of revision must be submitted to the people every seven years. Accordingly, modifications were made in 1852, 1877, 1889.

The State was the ninth to ratify the Federal Constitution, June 21, 1788, thus making certain the establishment of the United States. The capital of the Province of New Hampshire was Portsmouth. Until 1805 it was migratory, but at that date Concord was chosen. New Hampshire was Federalist in national politics till 1816, with the exception of 1804, when it voted for Jefferson. From 1816 to 1852 it was consistently Democratic. Since 1856 it has been stanchly Republican. The following is a list of the Governors of the Colony and State of New Hampshire:

AS A ROYAL PROVINCE

PRESIDENTS

John Cutts.....	1673-80
Richard Waldron.....	1681

GOVERNORS

Edward Cranfield.....	1682-85

H., 1875); McClintock, *History of New Hampshire* (New York, 1889); *New Hampshire State Library Annual Report* contains bibliography (Concord, 1891).

NEW HANOVER. The northernmost large island of the Bismarck Archipelago (q.v.).

NEW HARMONY. A town in Posey County, Ind., 15 miles north of Mount Vernon, the county-seat, on the Wabash River and on a

branch of the Illinois Central Railroad (Map: Indiana, B 4). It has the free library of the Workingmen's Institute with some 15,000 volumes, founded in 1838. There are flouring and planing mills, brick works, and minor industries. Population, in 1890, 1197; in 1900, 1341.

New Harmony was settled in 1805 by a community of Harmonists (q.v.), who, in 1824, sold out to Robert Owen and moved to Economy, Pa. In 1825 Owen organized a 'Preliminary Society,' and invited here 'the industrious and well disposed of all nations.' There was to be a community of goods according to age, religious worship was to be replaced by a series of 'moral lectures,' and children, when two years of age, were to be taken from their parents and educated by trained teachers. Within a few months the village became a 'scene of idleness and revelry,' but in 1826 Owen returned, and for a time the settlement prospered. Later in the year, disagreements arising, the original community separated to form three communities—New Harmony, Macluria, and Feiba Pevla—and in a short time the whole experiment was abandoned. William Maclure, one of the original leaders, then bought part of the land and founded a 'school of industry,' which after a short time was discontinued. Consult Lockwood, *The New Harmony Communities* (Marion, Ind., 1902).

NEW HAVEN. A seaport town in Sussex, England, on the English Channel at the mouth of the Ouse, $8\frac{1}{2}$ miles east of Brighton (Map: England, G 6). Its importance is to be measured by its shipping trade and not by its population. It is a bonding port with a well-equipped harbor, a large coasting trade, and bi-diurnal communication with Dieppe, France, 64 miles to the southeast. The average annual value of its imports and exports is \$70,000,000. The principal articles of export are woolen, cotton, silk, and hat manufactures, leather, silver plate, pictures, paper, machinery and mill work, cycles, hardware and cutlery, chemical products, etc.; the imports include agricultural produce and provisions of all kinds, cotton, woolen, silk, and linen manufactures, gloves, india-rubber goods, glassware, spirits, sugar, tobacco, and timber. It is a terminus of the London, Brighton and South Coast Railway, a coast guard station, and is protected by a large modern fort. Its twelfth-century Norman church is archaeologically interesting. Population, in 1891, 4995; in 1901, 6772.

NEW HAVEN. The county-seat of New Haven County, Conn., and the largest city of the State, situated at the head of New Haven Bay, four miles from Long Island Sound, and on the main line and several leased lines of the New York, New Haven and Hartford Railroad, 73 miles east by north of New York and 36 miles distant from Hartford, the State capital (Map: Connecticut, D 4).

New Haven is widely known as the 'City of Elms'—these famous trees bordering many of the streets and surrounding 'The Green,' a public square in the heart of the town as originally laid out. The city occupies about $22\frac{1}{2}$ square miles on a level plain, bounded east and west by the Quinnipiac and West rivers, and inclosed by hills, two spurs of which, East Rock and West Rock, rise to a height of 360 and 400 feet, respectively, and command fine views. East Rock is the picturesque point in an attractive park, its summit

crowned by a Soldiers' and Sailors' Monument, while on the slope of West Rock is Judge's Cave, where the two regicides, Goffe and Whalley, lay in concealment for a time. There are parks overlooking the harbor and other smaller inclosures, the entire public park system comprising 1100 acres. The city has some 200 miles of streets, about 70 miles of which are paved, a large proportion with macadam, and drained by 95 miles of sewers. New Haven is the seat of Yale University (q.v.), which, with its buildings and its historical and educational prominence, is the chief attraction. There are other noteworthy educational institutions, namely, Hopkins Grammar School (founded in 1660), Hillhouse High School, Boardman Manual Training School, and a State normal school. The more important charitable institutions include the New Haven and Grace hospitals, and Saint Francis (Roman Catholic) and New Haven orphan asylums. The Public Library contains more than 52,000 volumes, and there are also valuable collections belonging to the American Oriental Society, New Haven Colony Historical Society, New Haven Orphan Asylum, State Board of Health, and the Young men's Institute. Among other features are several churches built in the early years of the nineteenth century, and the old burying-ground in Grove Street, in which are the graves of Noah Webster, Timothy Dwight, B. Silliman, Eli Whitney, Samuel F. B. Morse, Theodore Winthrop, Presidents Day, Woolsey, and Porter, James D. Dana, and W. D. Whitney.

The commercial interests of the city lie in a distributing and coastwise trade, the latter being facilitated by an excellent natural harbor, which has been greatly improved, and which was once the scene of extensive shipbuilding. New Haven ranks first among the industrial centres of the State. Its manufactures, representing, according to the census of 1900, an invested capital of \$30,463,000, and having an annual production valued at \$40,762,000, include carriages, clocks, firearms and ammunition, rubber goods, corsets, hardware, foundry and machine-shop products, slaughtering and meat-packing products, boxes, etc. There are also large railroad repair shops.

New Haven is the name borne by three distinct administrative corporations—the city, town, and school district of New Haven—the town being coextensive with the limits of the city; thus New Haven maintains a town and a city government. The city government is vested in a mayor, elected every two years, a bicameral council, and in administrative officers, the majority of whom are appointed by the executive, but with the following exceptions: assistant city clerk, elected by the council; and city clerk, controller, sheriff, treasurer, and collector of taxes, chosen by popular vote. New Haven spends annually, in maintenance and operation, about \$1,415,000; the principal items of expense being \$380,000 for schools, \$190,000 for the police department, \$150,000 for interest on debt, \$140,000 for the fire department, \$90,000 for street cleaning and sprinkling, \$80,000 for municipal lighting, and \$75,000 for charitable institutions. The assessed valuation of property, real and personal, is more than \$115,000,000, including exemptions, and the bonded debt is over \$3,750,000.

Population, in 1800, 4049; in 1850, 20,345; in 1870, 50,840; in 1880, 62,882; in 1890, 81,298; in

1900, 108,027, including 30,800 persons of foreign birth and 2900 of negro descent.

In 1637 a small company of Puritans under John Davenport, their pastor, and Theophilus Eaton, a wealthy London merchant, arrived in Boston, and in the following year settled at New Haven, then called by the Indians Quinnipiac. Adriaen Block had previously visited the place and named it Roodenberg, probably from the reddish color of the soil. In November the new settlers bought from an Indian chief, Momanguin, a large tract of land, for which they paid "twelve coats, twelve alchymy spoons, twelve hatchets, twelve hoes, two dozen of knives, twelve porringers, and four cases of French knives and scissors." Momanguin agreed that the Indians should not "terrify, disturb, or injure" the whites, who, in return, promised to protect the Indians and extend hunting privileges in part of the ceded territory. In December another tract thirteen miles long and ten miles wide was bought from another Indian chief, Montowese, for thirteen English coats. Immediately after landing the settlers had entered into a 'plantation covenant,' but a regular government was not established until the 'Fundamental and Written Constitution' was adopted in June, 1639. The privileges of voting and holding office were limited to church members, and the Scriptures were solemnly proclaimed as the supreme and only law in both civil and ecclesiastical affairs. Eaton was chosen as first Governor, and by successive elections was retained in this office until his death in 1658. In 1640 the settlement received its present name (from Newhaven, England), and three years later it formed with Milford, Guilford, and Stamford (Southold, L. I., and Branford, Conn., being admitted later) a confederation known as the 'New Haven Colony,' which, in the same year, entered the New England Union. From 1660-64 the regicides Goffe and Whalley found shelter in and near New Haven (see above), and from 1670 to his death in 1688, another regicide, Dixwell, lived here under the name of 'James Davids.' In 1665, after a long and bitter struggle, the New Haven Colony was united to Connecticut under the Connecticut charter of 1662. In 1701 New Haven was made a joint capital with Hartford, and as such remained until 1873. In 1717 Yale College was moved here from Saybrook. On July 5, 1779, a British force under Generals Tryon and Garth captured the town after fighting sharp skirmishes with the inhabitants, and remained here until the 7th, having lost about 70 killed, while of the Americans 29 were killed and 17 wounded. In 1784 part of New Haven was incorporated as a city. Until its shipping trade was crippled by the Embargo and the War of 1812, New Haven was an important commercial port, but since then its energies have been devoted mainly to manufacturing. Steamboat communication with New York was opened in 1815, and the first railroad was completed in 1848. In 1856 a company left New Haven to help found Wabunsee, Kan. Fair Haven was annexed in 1870. Consult: Lambert, *History of the Colony of New Haven* (New Haven, 1838); Kingsley, *A Historical Discourse* (ib., 1838); Barber and Punderson, *History and Antiquities of New Haven* (ib., 1870); Levermore, *Republic of New Haven* (Baltimore, 1886); Atwater, *History of the City of New Haven* (ib., 1887); id., *History of the*

Colony of New Haven, new ed. (ib., 1902); Bartlett, *Historical Sketches of New Haven* (ib., 1897); and a brief article in Powell, *Historic Towns of the New England States* (New York, 1898); Blake, *Chronicles of New Haven Green* (New Haven, 1898); Baldwin, *Stories of Old New Haven* (ib., 1902); *Papers of the New Haven Colony Historical Society* (6 vols., ib., 1865-1900).

NEW HEBRIDES, hēb'ri-dēz. A group of islands in the Pacific Ocean, northeast of New Caledonia, extending from latitude 13° to 20° S., and from longitude 165° to 170° E. (Map: Australasia, J 4). Its total area is estimated at over 5000 square miles. The chief islands are Espiritu Santo, Mallicolo, Pentecost, Maewo, Sandwich, and High Islands. Some of the islands are composed of coral; others are of volcanic origin with several active volcanoes. The soil is fertile. Considerable quantities of sandalwood are exported. The chief agricultural products are the breadfruit, sago palm, banana, yam, pineapple, orange, etc. The climate is unhealthy. Even the natives are not immune from fever, and dysentery makes great ravages among them. The population is steadily decreasing; in 1901 it was estimated at 50,000. The people of this group of islands are Melanesians. They are chiefly dolichocephalic (cranial index, 70.4, but examples as high as 85 are found), very dark in complexion, below the medium in stature (64 inches), and have abundance of woolly hair. They are still in savagery, though under the teachings of Christian missionaries they have abandoned to a large extent head-hunting and cannibalism. Under discipline they become industrious and are a factor in the trade of the Pacific. The languages of New Hebrides belong to the sub-Papuan family everywhere except in Fotuna and Aniwa, and at Mel and Fel in Efata, which are Maori colonies from New Zealand still speaking Maori dialects. The best-known sub-Papuan languages are Epi, Pama, Amboym, Vunmarama, and Sesaki. On the southernmost island, Aneityum, the inhabitants are Christianized, can all read and write, and have over forty schools. The group forms a protectorate administered by a mixed commission of French and English officers.

NEW HOLLAND. The former name for Australia (q.v.).

NEW IBERIA. A town and the parish seat of Iberia Parish, La., 125 miles west of New Orleans, at the head of navigation on the Bayou Teche, and on the Southern Pacific Railroad (Map: Louisiana, D 3). This section has many natural features of interest, and is the scene of part of Longfellow's *Evangeline*. Avery's Island is famous for its deposits of rock salt. A Federal Government post-office is (1903) in course of construction, and the city has a public high school library, a fine city hall, and a public market. New Iberia is the centre of a productive agricultural section devoted to the cultivation of sugar-cane, cotton, rice, corn, potatoes, small fruits, and vegetables. It is also of considerable importance as an industrial centre, its establishments including ship-yards, foundries and machine shops, a knitting mill, and manufactories of cypress lumber, shingles, sash, doors, and blinds, cypress cisterns and tanks, cotton-seed products, soap, tabasco sauce, pressed

and common brick, wagons, and carts. The water-works and electric light plant are owned and operated by the municipality. Population, in 1890, 3447; in 1900, 6815.

NEW INN HALL. See OXFORD UNIVERSITY.

NEW IRELAND. See NEW MECKLENBURG.

NEW JERSEY. A middle Atlantic State of the United States. It lies between latitudes 38° 56' and 41° 21' N., and between longitudes 73° 54' and 75° 33' W. It is bounded on the north by the State of New York, which also bounds it for some distance on the east, being separated from it by the Hudson River, New York Bay, and Staten Island Sound. The remainder of the eastern boundary is formed by the Atlantic Ocean. On the south the State is bounded by Delaware Bay. The whole western boundary is formed by the Delaware River, which runs eastward in a sharp angle nearly to the middle of the State, and separates it from Pennsylvania. New Jersey is one of the smallest States of the Union, only three others, Rhode Island, Delaware, and Connecticut, having a smaller area. Its extreme length is 167 miles, and its average width 50 miles. Its area is 7815 square miles, of which 7525 square miles, or 4,816,000 acres, are land surface.

TOPOGRAPHY. The northern and southern divisions of the Atlantic slope meet in New Jersey on a line running west from Newark Bay. The former division is characterized practically by the absence of the coastal plain and by the less definite demarcation of the Piedmont plain (q.v.). The latter division is characterized by the well-defined presence of both. Though the State lies wholly within the Atlantic slope, it is crossed in the northwest by several ranges of the Appalachian system. There are four distinctly marked topographical regions running in parallel bands across the State from southwest to northeast, coterminous with and closely dependent on the outcropping bands of geological formations. (See paragraph *Geology*.) The first, beginning at the northwest, is the Kittatinny range and upland valley. This range is an extension of the Blue Mountains of Pennsylvania, and runs in a continuous ridge into New York, reaching in High Knob, near the boundary, a height of 1799 feet. The second region includes the Highlands, an outlying Appalachian range consisting of semi-isolated, plateau-like masses, rising to a height of 1200 to 1400 feet. The third band is the Piedmont plain, nearly as wide as the first two combined. It is, for the most part, an undulating plain ranging in elevation from the sea level in the marshes of the Hackensack Valley in the east to over 500 feet in the west. It is, however, diversified by bold trap-rock ridges extending in a northeast and southwest direction, such as the Palisades along the Hudson and the First and Second Mountains. The fourth region constitutes the coastal plain and includes the entire southern half of the State south of a line running from Trenton to Newark Bay. It is a gently undulating plain, sloping south and eastward. It is nowhere more than 400 feet, and in large part is less than 100 feet above sea level. It is trenched by river-valleys, and here and there diversified by isolated hills such as the Navesink

Highlands. It is bordered on the coasts by salt marshes fringed along the Atlantic by shallow coast-lagoons inclosed by outlying sand beaches.

The western slope of the State is drained by short tributaries into the Delaware River, but by far the greater portion drains directly into the Atlantic Ocean or its inlets. The principal rivers are the Passaic and Hackensack, flowing into Newark Bay; the Raritan, flowing through Raritan Bay into Lower New York Bay; the Mullica and Great Egg, emptying into the Atlantic lagoons; and the Maurice, into Delaware Bay. Lakes are confined chiefly to the northern section. There are several beautiful mountain lakes in the Highlands, the largest being Lake Hopatcong and Greenwood Lake, the latter lying partly in New York State. The most noted natural features are the Falls of the Passaic River at Paterson, the Palisades of the Hudson, and the Delaware Water Gap.

CLIMATE. The particular element affecting the climate of New Jersey is the ocean. Since the extreme northern portion is also the most elevated and the extreme southern portion is low and surrounded by water, the slight range in temperature due to difference in latitude is accentuated, so that there is a variation of 8 degrees between the mean annual temperature of the north and the south. The former is 46° and the latter 54°. The mean winter temperature is 35° in the south and 25° in the north, and the mean summer temperatures, respectively, 75° and 67°. The mean annual rainfall is, in general, between 44 and 50 inches in the greater part of the State. In the extreme eastern portion it is over 50 inches, and in the south along Delaware Bay it is less than 42 inches. As a whole, the State is quite healthful, and the sandstone belt is considered particularly favorable to persons inclined to lung diseases. There are numerous summer and winter health resorts. Lakewood (q.v.), in the heart of the pine woods, is one of the most popular winter resorts in the Northern States. Atlantic City, Ashbury Park, and Cape May, although essentially summer resorts, are also popular winter resorts for invalids. Other well-known summer seaside places are Long Branch, Elberon, and Ocean Grove.

For flora and fauna, see paragraph under UNITED STATES.

GEOLOGY. The geology of New Jersey is very intimately connected with its topography. The outcrops of the rock formations cross the State from the southwest to northeast in bands closely coincident with the topographical regions described above. Beginning at the northwestern corner, we find the Kittatinny Mountain and valley, consisting of Paleozoic slate, limestone, and sandstone, and these formations also extend into some of the western valleys of the Highlands. The Highlands themselves, however, consist of the still older Archæan gneiss, granite, and mica-schist. The Piedmont plain is also called the Red Sandstone Plain, as it consists mainly of the Triassic red sandstone, with scattered intrusions of trap-rock. In the coastal plain the surface deposits consist wholly of unindurated materials. In the north there is a band running from Staten Island Sound southwest to Camden, composed of Cretaceous marls, sands, and clay, while the entire remaining portion is covered with Tertiary clays and sand finally fringed by the modern sand bars along the

coast. Each of the main geological eras is represented except the Carboniferous.

MINING. The most extensively utilized of the State's diversified geological resources are its clays. New Jersey ranks second in the production of pottery and third in the total output of clay products. Brick clay is found in most parts of the State. The value of the pottery products and of the combined output of brick and tile, respectively, ranges between \$5,000,000 and \$9,000,000 annually. (See *Manufactures* below.) Morris County furnishes infusorial earths used in the manufacture of dynamite and giant powder, and for polishing purposes. Deposits of marl found in the State are utilized for fertilizers. A variety of stone is quarried in the northwestern counties, and constitutes another important source of wealth. The production of granite has increased rapidly since 1896. The output for 1900 was appraised at \$1,170,555, or five times the value of the product in the former year. The value of the sandstone quarried in 1900 was \$198,234, but the annual yield is usually worth much more. New Jersey ranks second in the production of Portland cement. Iron was mined in Warren County early in the history of the State, and has been mined continuously in the northwestern part until the present time. The entire product in 1900 was of the magnetite variety, estimated at 344,247 long tons. The iron is mined with greater difficulty than in the larger iron-producing regions, but the saving of the cost of transportation makes it profitable. The New Jersey ores have a larger per ton value (\$3.18 in 1899) than those obtained in any other State.

FISHERIES. New Jersey, with its long and well indented coast line, and bounded by the Hudson and the Delaware, is well adapted for the development of an extensive fishery industry, in which seventeen out of the twenty-one counties of the State participate directly. There were 12,270 persons so engaged in 1898, as against 16,539 in 1891. The value of the product for 1898 was \$3,563,766, only about \$44,000 more than the product of 1891. The catch of oysters in the same year was valued at \$1,670,000. Next to oysters, the principal species with respect to value are clams, shad, squeteague, bluefish, and cod. The value of caviar in 1898 was \$79,693. The menhaden industry in that year was represented by six factories, and yielded a product of \$57,995.

AGRICULTURE. Only 59 per cent. of the total land area is included in farms. The area of improved land increased until 1880, since when it has remained practically stationary. In 1900 the percentage of farm land improved was 69.6. The number of farms increased during the half century nearly 45 per cent., while the average acreage decreased from 115.2 in 1850 to 82 in 1900. There is a gain in the per cent. of rented farms, especially cash-tenant farms, which increased 53.6 per cent. during the decade 1890-1900, so that these farms represented in 1900 15.3 per cent. of the total number of farms, as against 14.6 per cent. for the share tenants. The soil is generally a red sandy loam, easily tilled. The river valleys are very fertile, but in most parts of the State fertilizers are advantageously used. The cost of fertilizers per farm in 1900 was \$62. Between 1880 and 1890 the area devoted to cereals decreased considerably, but the falling off was checked in the next decade, when the loss

was confined to oats and rye, the other crops showing gains. Accordingly the decrease in the cereals is not so marked as in some other Eastern States. Corn, the principal cereal, is raised throughout the State; wheat, next in rank, is grown in the western counties; rye, oats, and buckwheat are confined almost entirely to the northwestern counties. The acreage of hay and forage crops exceeds that of corn and wheat combined, and considerable areas of the poorer lands are being turned into permanent pasture lands. As above suggested, the proximity of large cities—notably New York and Philadelphia—has led to a large gardening and fruit-raising industry. Of the \$8,400,000 of vegetable produce grown in the census year 1900, 26 per cent. and 14.4 per cent. respectively represented the value of the Irish and the sweet potatoes. New Jersey ranks next to Maryland in the production of tomatoes; the acreage devoted to their cultivation exceeded that of sweet potatoes. Sweet corn, melons, and cabbages were the most important of the other vegetables. The raising of early vegetables under glass for the New York and Philadelphia markets is a large industry.

Orchard fruits receive much attention, the peach-growing industry being very extensive in the northwestern counties. From 1890 to 1900 the number of peach trees decreased about 38 per cent. There was an equal percentage of increase in the number of apple trees. In 1900 32.1 per cent. of all fruit trees in the State were apple trees, and 48.6 were peach trees. A great variety of small fruits are raised, strawberries and cranberries being most important. Cranberry culture is confined largely to the marshy lands of Burlington and Ocean counties. New Jersey is surpassed by few States in the extent of its floriculture. The value of the product grown for the market in 1900 was nearly \$2,000,000.

The following table of acreage is self-explanatory:

CROPS	1900	1890
Corn.....	296,258	267,648
Wheat.....	132,571	121,570
Oats.....	75,969	121,327
Rye.....	68,967	77,245
Buckwheat.....	15,762	13,520
Hay.....	444,610	458,267
Potatoes.....	52,896	46,711
Potatoes (sweet).....	20,588	20,157

STOCK-RAISING. From 1890 to 1900 there was a marked increase in the number of neat cattle, a decrease in sheep and swine, and a noticeable increase in horses. The decrease in dairy cows, as shown below, is more apparent than real, owing to the change in the method of enumeration. Over one-half of the total income of all animal products was derived from the dairy industry. Of the \$7,170,000 realized from dairy produce sold, \$6,318,000 represented milk. The value of the poultry products is also quite large.

The following table shows the leading livestock holdings:

	1900	1890
Dairy cows.....	157,407	161,576
Other cattle.....	82,577	50,496
Horses.....	94,024	86,925
Mules and asses.....	4,931	8,227
Sheep.....	26,863	55,409
Swine.....	175,887	224,388

MANUFACTURES. Manufacturing affords employment to a larger number of wage-earners than any other industry in the State. The number in 1900 was 241,582, or 12.8 per cent. of the population. The percentage of people thus engaged has increased faster than the population itself, there being in 1850 only 7.7 per cent. connected with manufactures. The increase in the value of the product has been twice as rapid. From 1890 to 1900 but few States exceeded New Jersey either in the absolute or the percentage (72.5) of gain attained in the value of manufactured products. In the latter year this value was estimated at \$611,748,000, placing the State sixth in rank. Prominent among the factors contributing to the development of manufactures are first, New Jersey's proximity to the large markets of New York and Philadelphia; secondly, its admirable transportation facilities; and lastly, its iron and clay resources and its proximity to the coal and other mineral fields of Pennsylvania.

The manufacture of textiles constitutes the most important group of industries. New Jersey ranks first in the production of silk and silk goods; and Paterson, the chief centre, is the largest silk manufacturing city in the United States. The industry was first established here in 1840, but it was not until the decade ending with 1870 that its great growth began. From 1890 to 1900 the value of the product increased nearly 30 per cent. Cottons, woollens, and worsteds are also produced, but in less quantities. The output of woollens suffered a decline from 1890 to 1900, while the output of worsteds increased more than threefold. The dyeing and finishing of textiles has assumed large proportions.

Another important group includes the manufacture of iron and steel and their products. The iron and steel industry began in Warren County at an early period, the supply of iron ore being secured in that locality. The value of products more than doubled during the decade 1890-1900. Of yet greater value are the products of the closely related foundry and machine-shop industry. During 1890-1900 the advantages of cheaper land and more efficient railway service brought hither a number of New York establishments. Newark, Paterson, and Elizabeth are the largest centres. The value of the electrical apparatus produced in 1900 was nearly eightfold greater than in 1890. The sewing-machine output increased in value 59 per cent. in the same period. In 1900 the State ranked fourth in the manufacture of jewelry, Newark being the chief centre.

The State's valuable beds of clay and sand have each given rise to an important industry. Brick clays are found in every section, but nearly all the rich clays are in Middlesex County, and fortunately close to the navigable coast waters of the Raritan River. Architectural clay products, sewer pipe, etc., are produced in this section in great abundance. Trenton has become famous for its pottery. The industry was begun here in 1852, but it was not until the Centennial Exhibition in 1876 that the superior quality of the product became known, and a wide market was opened for it. From 1890 to 1900 the value of the total clay product increased 73.1 per cent. The sand deposits in the southern part of the State are of a quality that makes them valuable in the manufacture of glass, and glass has been produced in that sec-

tion since pre-Revolutionary times. The leather industry is centred largely in Newark. Elizabeth has one of the largest sewing-machine factories in the United States. Chemicals, liquors, and tobacco goods are all extensively produced and have each made large gains. The first two are most important in Newark, the last in Jersey City. Extensive oil-refining works are located at Bayonne, where the surrounding water of New York Bay is of sufficient depth to enable ocean-going vessels to load from the docks. The table on the following page explains itself.

FORESTS AND FOREST PRODUCTS. The primeval forests, consisting mainly of hard woods, have been almost wholly removed, but there is considerable merchantable second-growth timber. In 1900 the woodland was estimated at 3234 square miles, or 43 per cent. of the State's area. The value of the timber cut did not show any marked tendencies to increase or decrease in the last half of the nineteenth century, the maximum value, \$2,745,317, being attained in 1870. The value of the planing-mill products, etc., may be seen in the table on the following page.

TRANSPORTATION AND COMMERCE. New Jersey is well provided with transportation facilities. Railroads which approach New York City from the west, or Philadelphia from the east necessarily traverse its territory. New Jersey, therefore, has a greater railroad mileage in proportion to its area than any other State. The mileage increased from 560 in 1860 to 2109 miles in 1890, and 2242 miles in 1900. The terminals of the lines centring in New York City are on the New Jersey side of the Hudson River.

The canals of New Jersey were once its principal commercial channels. The Morris Canal, 101 miles long, from Jersey City to the Delaware River at Phillipsburg, has always transported vast quantities of coal from Pennsylvania to New York, and now belongs to the Lehigh Valley Railroad. It cost originally \$14,000,000. The Delaware and Raritan Canal, from New Brunswick to Bordentown, 43 miles long, with a feeder to Trenton, 22 miles, was built in the early part of the nineteenth century at a cost of \$3,935,287. It is under lease to the Pennsylvania Railroad.

BANKS. In 1804 two banking companies were chartered by the Legislature, one to do business in Newark and the other in Trenton. A general banking law was passed in 1812 for the protection of depositors. This law remained in force till 1850. Reports were made obligatory, the total indebtedness and the rate of discount were limited. But the provisions of the law were avoided, and a number of speculating banks flooded the State with worthless paper. This condition of affairs and the suspension of specie payment in 1837 led to a reform in 1850. Another general banking law was passed. Under this statute the bank circulation had to be guaranteed by deposits of collateral security—bonds of States, etc. The limits of loans on real estate were strictly set and investigations of the banks made possible. In 1860 there were eight banks of issue. Besides these, there were a number of specially incorporated banks of discount and deposit. In 1859 the number was 36, but most of them availed themselves of the national banking law, and there were only five left in 1870. State banks became somewhat more popular toward the end of the century. They numbered 18 in 1902.

COMPARATIVE SUMMARY OF FIFTEEN LEADING INDUSTRIES

INDUSTRIES	Year	Number of establishments	Average number wage-earners	Value of products, including custom work and repairing
Total for selected industries for State.....	1900 1890	1,780 1,867	117,008 77,974	\$258,421,105 156,491,146

In 1868 there were 55 national banks, and in 1900, 115. A Department of Banks and Insurance was established in 1891. The banking law was revised in 1899. Trust companies have rapidly multiplied in the State since 1880, under the influence of the organization of gigantic corporations, which have made the State conspicuous. In ten years the number of these increased from 11 to 23, and the deposits increased eightfold. Savings banks were established early (1828). A law for regulating them was passed in 1876. It remains almost unchanged. The condition of the various banks in 1902 is shown in the following table:

	National banks	State banks	Trust companies	Savings banks
Number of banks	124	18	47	28
Capital.....	\$17,164,000	\$1,593,000	\$9,321,000	
Surplus.....	11,375,000	979,000	6,890,000	\$6,080,000
Cash, etc.....	5,965,000	493,000	1,823,000	423,000
Deposits.....	87,949,000	8,950,000	67,642,900	69,886,000
Loans.....	80,248,000	8,063,000	56,105,000	28,812,000

FINANCES. The beginning of the Civil War found the State in a satisfactory financial condition. It became involved in heavy war expenses,

and a loan of \$2,000,000 and a State tax of \$100,000 for war purposes were authorized in 1861. In 1866 the total war debt amounted to \$3,305,200. Besides, the minor civil divisions of the State (counties and towns) spent more than \$23,000,000 for war purposes. This debt was totally extinguished by the redemption of the last \$71,000 on January 1, 1902.

In the matter of taxation New Jersey is in advance of many States, having long ago solved the problem of conflict between State and local taxation by entirely dividing these two fields. Even between 1840 and 1850 the income of the State was largely derived from taxes on the gross receipts of railroads ('transit duties' was their official designation), taxes on capital stock of railroads, etc. A State tax upon general property was only introduced in 1861 for war purposes, and though it existed for twenty years, it was exceedingly small. In 1880 75 per cent. of the income was derived from corporation taxes. New laws for taxation of railroads, as well as other corporations, were passed in 1884 and 1885, and were declared constitutional after a hard struggle. Since then the only State tax on general property is collected for the purposes of the school fund. The whole sum collected

is returned to the towns. This is therefore a State tax in form only.

The income of the State Government is derived from taxes on railroads (70 to 75 per cent.) and other corporations (15 per cent.), and fees, licenses, etc. Since 1890 taxes on new corporations, of which so many have been formed in New Jersey, have constituted a large share of the receipts. In 1902 the total receipts of the general State fund were \$4,317,846, of which \$2,866,363 came from corporation taxes. The expenditures reached \$3,924,811, leaving a balance of \$393,035. But of the general fund, \$883,978 was distributed among the counties for school purposes. Besides, the State collected and re-distributed among the counties \$1,486,806 as school tax, and \$400,784 as a local railroad tax. The school fund amounts to \$3,839,692. Though there was no debt, the sinking fund contained \$172,550.

GOVERNMENT. The present Constitution was ratified by the people in 1844, and amended at a special election in 1875. Proposed amendments must receive the approval of a majority of the members elected to both Houses at two consecutively chosen Legislatures, and afterwards the approval of a majority of the qualified electors. But amendments cannot be submitted to the people oftener than once in five years. Voters must be citizens who have resided in the State one year, and in the county five months. An elector is not deprived of his vote by reason of being in the actual military service of the army or navy of the State or United States. The registration of voters is required by law. The capital is Trenton.

LEGISLATIVE. The Legislature, meeting annually, and unlimited as to session, is composed of 21 Senators, one from each county, elected for three years, and of Representatives, not to exceed 60, elected for one year, from the counties on the basis of population, every county being at all times entitled to one member. The salary of a Representative is \$500. State elections are held annually on the Tuesday after the first Monday in November. Revenue bills originate in the Lower House.

EXECUTIVE. The Governor is elected for three years, and cannot be re-elected until three years shall have elapsed. He can convene extra sessions of the Legislature or of the Senate alone. The Governor's veto of bills or items of appropriation bills is overridden by a majority vote of the whole number elected to each House. In conjunction with the six judges of errors and appeals and the Chancellor, the Governor grants pardons, etc. The president of the Senate and the Speaker of the House respectively succeed to the Governorship in case of a vacancy. The State Treasurer and Controller are appointed for three years by the Senate and General Assembly in joint meeting. The Attorney-General, prosecutors of the pleas, clerk of Supreme Court, clerk of the Court of Chancery, Secretary of State, and keeper of the State prison are appointed for five years—by the Governor and Senate.

JUDICIARY. The distinction between courts of law and courts of equity is still maintained in New Jersey. The judges are appointed by the Governor, the judges of the Supreme Court and Chancellor for seven years, others for five years—all subject to confirmation by the Senate. The

first or lower courts are the county courts of common pleas and oyer and terminer, presided over by a single judge; an orphan's court; and court of general quarter sessions of the peace. Next above is the Supreme Court, which makes the circuit of the State, and is composed of a Chief Justice and eight associates. A prerogative court is presided over by the Chancellor alone. The Court of Errors and Appeals in the last resort is composed of the Chancellor, the justices of the Supreme Court, and six judges specially appointed. The Senate acts as a court for the trial of cases of impeachment.

LAWS, ETC. A wife holds property acquired before marriage free from control of her husband or liability for his debts. If living with her husband, she cannot convey her real property without his consent. The legal and only rate of interest is 6 per cent. A State Board of Agriculture was established in 1886, and there are a board of health and bureau of vital statistics. Each city and township is required to have local boards of health.

LOCAL GOVERNMENT. County sheriffs and coroners are elected by the people for terms of three years, but cannot be their own immediate successors. The counties also elect clerks and surrogates for terms of five years. The townships elect justices of the peace for terms of five years. The affairs of towns and counties are regulated according to general laws, and special laws cannot be passed relating to them.

The State has ten Representatives in the Lower House of Congress.

MILITIA. The number of men of militia age in the State in 1900 was 422,758. The number of militia in 1901 was 4038.

POPULATION. The growth of the population is shown by the following figures: 1790, 184,139; 1820, 277,426; 1850, 489,555; 1860, 672,035; 1870, 906,096; 1880, 1,131,116; 1890, 1,444,933; 1900, 1,883,669. From the 9th position in 1790 New Jersey fell to 21st in 1860, but rose again to 16th in 1900. Both the absolute and the proportionate increase have been much greater since 1840 than prior to that year. The absolute increase was greatest from 1890 to 1900, the percentage of increase being 30.4, as compared with 20.7 for the United States, and was exceeded only in one State east of the Mississippi River. The recent rapid growth is due largely to the heavy immigration of foreigners. Of the 431,884 foreign-born, according to the census of 1900, about one-half were German or Irish, the most prominent among the remainder being the English and Italians. In the same year the negroes numbered 69,844. The density of the population—250.3 to the square mile—is exceeded in only two States. The increase from 1890 to 1900 has been almost wholly on the part of the urban population. In 1900 the 49 cities containing over 4000 inhabitants each, together contained 67.5 per cent. of the total population, only three States having as high a percentage of urban population.

CITIES. In the State of New Jersey in 1900 the population of the ten largest cities was as follows: Newark, 246,070; Jersey City, 206,433; Paterson, 105,171; Camden, 75,935; Trenton, 73,307; Hoboken, 59,364; Elizabeth, 52,130; Bayonne, 32,722; Atlantic City, 27,838; Passaic, 27,777.

RELIGION. The Roman Catholics form about 16 per cent. of the total population of the State.

The principal Protestant denominations are the Methodist, with about 19 per cent. of the total number of church members; the Presbyterian, 12 per cent.; the Baptist, 8 per cent.; and the Protestant Episcopal and the Reformed, with about 6 per cent. each.

EDUCATION. The question of education received attention at a very early date. Bergen had a school as early as 1661, and the charter of Woodridge (1669) provided for the granting of 100 acres of land for school purposes. The arrival of the Quakers gave an additional impetus. Even before the foundation of Princeton University, a number of classical schools were in existence. The finances for schools were not infrequently obtained by means of lotteries. After the Revolutionary War the matter of education, which had been almost entirely neglected during the struggle for freedom, again came to the fore. In 1816 the State Legislature laid the foundation of a permanent school fund by a grant of \$16,000; and in 1824 a provision was made for the addition of one-tenth of all the annual State taxes. In 1871 a free public school system was established.

The educational affairs of the State are under the supervision of a State superintendent, appointed by the Governor and the Senate for three years, and of a board of education, whose 16 members are also appointed by the Governor and Senate. The State has a compulsory education law, and provides free text books and school supplies. The illiterate population in 1900 amounted to 5.9 per cent. of the total population of ten years and over. The proportion of illiteracy among the native whites is 1.7 per cent.; foreign whites, 14.1 per cent.; colored, 17.5 per cent. The 1893 public schools of the State employed, in 1901, 7561 teachers, of whom only 998 were males. The average monthly salaries received were \$91.87 for male and \$52.88 for female teachers. The length of the school term in 1901 was 183 days. The revenue for educational purposes amounted in 1901 to \$6,718,189, of which \$200,000 was derived from the permanent school fund and the rent of school lands, \$2,399,724 from State taxes, and \$4,079,945 from local taxes. The expenditures for the same year amounted to \$7,189,712, or \$32.49 per pupil in average attendance. The evening schools maintained in the larger cities of the State had an average attendance of 5397 in 1900.

For the preparation and training of teachers there are the State Normal School at Trenton and its auxiliaries and the Model and Farnum Preparatory schools. New Jersey had, in 1900, 170 public and private high schools and academies, with a total of 15,158 students. Technical education is provided by Stevens Institute (q.v.) at Hoboken and the Newark Technical School. The principal institutions for higher education are Princeton University, at Princeton; Stevens Institute of Technology, at Hoboken; Saint Peter's College (R. C.), at Jersey City; Saint Benedict's College (R. C.), at Newark; Rutgers College (Reformed), at New Brunswick; Seton Hall College (R. C.), at South Orange; and Bordentown Female College, at Bordentown.

CHARITABLE AND PENAL INSTITUTIONS. There is a State board of charities. Care and instruction of the deaf and dumb were provided in New York City and Buffalo until 1883, when a State

institution was completed at Trenton. The blind are taken care of in New York and Pennsylvania institutions. There are a State training school for feeble-minded children and a State institution for feeble-minded women, both at Vineland. The home for disabled soldiers is at Kearney. An industrial school for girls at Trenton is maintained by the State. A State reform school for juvenile delinquents is located at Jamesburg in Middlesex County. The city of Newark also maintains a reformatory home at Verona. The old State lunatic asylum is at Trenton. This institution derives a revenue from the care of private patients. The asylum for the insane near Morristown is one of the finest structures for the purpose in the country, having cost about \$2,500,000. It can accommodate upward of 1000 patients. The total expense for the insane and the poor in the fiscal year 1899-1900 was \$1,812,962. The State prison is at Trenton. In 1884 the Legislature passed a bill abolishing contract convict labor in the prison. The inmates must now be employed upon goods used in institutions under State control, on the public-account system, or on the piece-price plan. A system of releasing certain inmates of the State prison on parole has been in operation since 1891.

HISTORY. The territory included within the limits of the present State was claimed by the Dutch without any definite boundaries as a part of New Netherland, and between 1614 and 1621 settlements were made in what is now Bergen County. Swedes and Danes also settled on the Delaware River, but were brought under the jurisdiction of the Dutch by Governor Stuyvesant. In 1664 this whole region was granted to James, Duke of York, by Charles II., but before James took possession he conveyed to John, Lord Berkeley, and Sir George Carteret the land between the Delaware and Hudson rivers, bounded on the north by a line drawn from 41° 21' on the Delaware River to 41° on the Hudson, the present boundaries. In 1664-65 Berkeley and Carteret granted a form of government and settlement, the 'Concessions,' which allowed a popular assembly, and under which the colony was governed until the Revolution. Philip Carteret was sent over as Governor in 1665, and made Elizabeth-Town his capital. On March 18, 1674, Berkeley sold his interest to John Fenwick, in trust for Edward Byllinge, both Quakers, for £1000, and in 1676 the province was divided by a line drawn from Little Egg Harbor to the northwest corner. The Quakers took the western half, known as 'West New Jersey,' while Carteret retained 'East New Jersey.' Soon Byllinge surrendered his title to William Penn and others as trustees for his creditors, and West Jersey was divided into one hundred shares, of which Fenwick retained ten. Each of these shares carried with it the same rights of sovereignty which had been granted to the Duke of York. When the question was raised as to whether the Duke of York, not being a sovereign, could transfer the rights of government, Sir Edmund Andros, then Governor of New York, arrested Philip Carteret and Fenwick, and attempted to assume control. He was forced to give way in 1681, however, and the colonies continued to be governed by the proprietors. In 1682 Carteret's heirs sold East Jersey to William Penn and his associates. The

proprietors of both colonies in 1702 ceded their right of government to the Crown, and the colonies were united and placed under the Governor of New York, though New Jersey retained its separate assembly. There was freedom of worship, but political privileges were withheld from Roman Catholics, and even as regards others the possession of at least two hundred acres of land or of property valued at £50 was a necessary qualification for the suffrage. In 1738 the province received a separate Governor. Manufacturing began very early. A paper mill was established at Elizabeth in 1728, and in 1769 forty of these were in operation. By 1750 the population was about 80,000. A glass factory was begun in 1748. In 1791 the Society for the Encouragement of Useful Manufactures was chartered, with the exclusive right of utilizing the falls of the Passaic, and the town of Paterson was founded. The first Provincial Congress met at New Brunswick, July 21, 1774. In 1776 the Royal Governor, William Franklin, was deposed, and on July 2, 1776, the Provincial Congress adopted a 'Constitution' for the 'Colony of New Jersey' without submitting it to the people. Under this instrument the Governor was to be chosen annually, and was to be executive, president of the council, and chancellor, thus combining executive, legislative, and judicial functions. On July 18th the Provincial Congress ratified the national Declaration of Independence, and changed the title of the colony to the 'State of New Jersey.' During the Revolution the State did its full duty, and was the scene of many of the battles of the war. (For military operations during the War of the Revolution, see UNITED STATES.) The State hesitated to enter a Federal union out of fear of the larger States. In the constitutional convention of 1787 William Paterson (q.v.), one of her delegates, proposed the famous 'New Jersey Plan,' which provided for a single legislative House, in which each State should have one vote. The State ratified the Constitution, December 18, 1787. The capital was fixed at Trenton in 1790, and the history of New Jersey for many years after that was one of increasing prosperity. In 1844 a new constitution was adopted, providing for a term of three years for the Governor, and taking away his judicial duties. In 1875 the Constitution was thoroughly revised. The word 'white' was struck from the suffrage clause, though, of course, it had been a dead letter since the adoption of the Fifteenth Amendment to the United States Constitution. Politically, the State has generally inclined toward the Democratic Party. In 1796, 1800, and 1812, it supported the Federalist candidates; from 1836 to 1848 it was Whig; in 1860 it gave four votes to Lincoln and three to Douglas; in 1872 it cast its vote for Grant; and in 1896 and 1900 it went Republican on the money question. The following is a list of the colonial and State Governors of New Jersey:

GOVERNORS OF EAST AND WEST JERSEY AFTER THE UNION	
Edward, Lord Cornbury *	1702-08
John, Lord Lovelace *	1708-09
Robert Hunter *	1710-19
William Burnet *	1720-28
John Montgomerie *	1728-31
Lewis Morris (pres. Council)	1731-32
William Cosby *	1732-36
John Anderson (pres. Council)	1736
John Hamilton (pres. Council)	1736-38

* Also Governors of New York.

GOVERNORS OF NEW JERSEY ONLY

Lewis Morris	1738-46
John Hamilton (pres. Council)	1746
John Reading (pres. Council)	1746-47
Jonathan Belcher	1747-57
John Reading (pres. Council)	1757-58
Francis Bernard	1758-60
Thomas Boone	1760-61
Josiah Hardy	1761-62
William Franklin	1762-76

GOVERNORS OF THE STATE

William Livingston	Federalist	1776-90
William Paterson	"	1790-93
Richard Howell	"	1793-1801
Joseph Bloomfield	Democratic-Republican	1801-02
John Lambert (acting)	"	1802-03
Joseph Bloomfield	"	1803-12
Aaron Ogden	Federalist	1812-13
William S. Pennington	Democratic-Republican	1813-15
Mahlon Dickerson	"	1815-17
Isaac H. Williamson	"	1817-29
Garret D. Wall (declined)	Democrat	1829
Peter D. Vroom	"	1829-32
Samuel L. Southard	Whig	1832-33
Elias P. Seeley	Democrat	1833
Peter D. Vroom	"	1833-36
Philemon Dickerson	"	1836-37
William Pennington	Whig	1837-43
Daniel Haines	Democrat	1843-44
Charles C. Stratton	Whig	1844-48
Daniel Haines	Democrat	1848-51
George F. Fort	"	1851-54
Rodman M. Price	"	1854-57
Wm. A. Newell	American	1857-60
Charles S. Olden	"	1860-63
Joel Parker	Democrat	1863-66
Marcus L. Ward	Republican	1866-69
Theodore F. Randolph	Democrat	1869-72
Joel Parker	"	1872-75
Joseph D. Bedle	"	1875-78
George B. McClellan	"	1878-81
George C. Ludlow	"	1881-84
Leon Abbett	"	1884-87
Robert S. Green	"	1887-90
Leon Abbett	"	1890-93
George T. Werts	"	1893-96
John W. Griggs	Republican	1896-98
David O. Watkins (acting)	"	1898
Foster M. Voorhees	"	1898-1902
Franklin Murphy	"	1902 -

NEW JERSEY, COLLEGE OF. See PRINCETON UNIVERSITY.

NEW JERSEY TEA. An American shrub. See CEANOTHUS; and Plate of MINT, ETC.

NEW JERUSALEM CHURCH. See SWEDENBORGIANS.

NEW KEN'SINGTON. A borough in Westmoreland County, Pa., 18 miles northeast of Pittsburg; on the Allegheny River, and on the Buffalo and Allegheny River division of the Pennsylvania Railroad (Map: Pennsylvania, B 3). It is known as a centre of large steel and iron industries, and for its brewing interests. There are also in the vicinity manufactories of glass and white lead. Population, in 1900, 4665.

NEW LAN'ARK. A village near Lanark, Scotland, where Robert Owen put into operation his plans for industrial reorganization looking toward the betterment of the workingman. See LANARK and OWEN, ROBERT.

NEWLANDS, FRANCIS GRIFFITH (1848—). A United States Senator from Nevada, born at Natchez, Miss. He studied at Yale College and the Columbian Law School, practiced law in San Francisco, and, having become a citizen of Nevada, represented that State in the national House of Representatives from 1893 to 1903, when he was elected to the Senate. He has been a strong advocate of Western irrigation and of the free coinage of silver.

NEW LAWS. A code promulgated by Charles V. at Madrid in 1543 for the protection of the Indians in the Spanish colonies. The New Laws (Sp. *Nuevas Ordenanzas*), which were due to the influence of Bartolomé de las Casas, 'the Apostle of the Indies,' restricted slavery and provided for the religious instruction of the Indians. The laws were opposed by the colonists, and in Peru were largely the cause of the rebellion under Gonzalo Pizarro. By 1560 they had ceased to be effective.

NEW LEB'ANON. A town in Columbia County, N. Y., 24 miles southeast of Albany; on the Chatham and Lebanon Valley Railroad (Map: New York, G 3). It includes several villages, among which Lebanon Springs, a popular summer resort, noted for thermal springs, and Mount Lebanon, the site of a Shaker village, are best known. The town is engaged principally in agriculture, and in manufacturing patent medicines, thermometers, and barometers, glass, flour, lumber, chairs, brooms, and baskets. Population, in 1890, 1765; in 1900, 1556.

NEW LEINSTER. The former name of Stewart Island. See NEW ZEALAND.

NEW LEX'INGTON. A village and the county-seat of Perry County, Ohio, 21 miles south by west of Zanesville; on the Toledo and Ohio Central, and the Cincinnati and Muskingum Valley railroads (Map: Ohio, F 6). It has Saint Aloysius Academy and a handsome court house. There are some manufactures, clay works being among the leading establishments, and in the vicinity are extensive coal fields. Population, in 1890, 1470; in 1900, 1701.

NEW LIGHT. A fish. See CRAPPIE.

NEW LON'DON. A city, port of entry, and one of the county-seats of New London County, Conn., 14 miles south of Norwich, the other county-seat, and 51 miles east of New Haven; on the Thames River, about three miles above its entrance into Long Island Sound, and on the New York, New Haven and Hartford and the Central Vermont railroads (Map: Connecticut, G 4). It has direct communication with New York by steamboat, and an excellent harbor defended by Forts Trumbull and Griswold. Just above the city, on the east side of the river, is

a small United States naval station. New London is a delightful place of residence and popular resort in summer. Among its features of interest are a fine soldiers' and sailors' monument, a handsome public library, the New London County Historical Society and Library, the Hempstead House, one of the oldest houses in Connecticut, the Old Town Mill, erected in 1646 and still in operation, the little schoolhouse in which Nathan Hale was a teacher, Boulder Park on the Thames, White Beach, a popular and attractive bathing beach, Williams Park, Memorial Park, and the great railroad drawbridge completed in 1890. The annual Yale-Harvard boat race is rowed on the Thames. New London was formerly the seat of extensive whaling and sealing interests, which are still of some importance, though manufacturing is the leading industry. The principal establishments are silk mills, a woolen mill, ship yards, foundries and machine shops, a cotton-gin factory, bed-quilt mills, and printing-press works. The government, under a charter of 1894, is administered by a mayor, chosen every three years, and a unicameral council that controls elections to subordinate departments, excepting that of the schools, which is chosen by popular vote. The water-works are owned and operated by the municipality. Population, in 1889, 13,757; in 1900, 17,548.

New London was founded in 1646 by John Winthrop, the younger, and until 1658, when it received its present name, was known as Naumeg. During the 'Great Awakening' of 1741 there was a remarkable manifestation of religious enthusiasm here. On September 8, 1781, General Arnold, at the head of a large British force, and assisted by a fleet of thirty-two vessels, attacked New London, killed a number of its inhabitants, and burned nearly all of the wharves and stores. (See GIBSON.) New London was incorporated in 1784. Consult: Caulkins, *History of New London* (New London, new ed., 1900); Starr, *A Centennial Historical Sketch of the Town of New London* (ib., 1876); and an article, "Historic New London," in *New England Magazine*, vol. v. (Boston, 1887).

NEW MADRID. A city and the county-seat of New Madrid County, Mo., 40 miles south by west of Cairo, Ill.; on the Mississippi River, and on the Saint Louis Southwestern Railroad (Map: Missouri, G 5). The centre of a productive region, it has a large river commerce in grain, lumber, cotton, live-stock, etc. There are cotton gins, and manufactories of lumber, veneer, staves, and flour. Population, in 1890, 1193; in 1900, 1489. New Madrid was founded in 1788 as a Spanish settlement, by a few American frontiersmen. For a time during the Civil War it was an important Confederate military station, but on March 14, 1862, it was abandoned and fell into the hands of the Federal forces.

NEWMAN, nū'man, EDWARD (1801-76). An English naturalist and publisher, born at Hempstead, in Middlesex. In boyhood he showed an unusual interest in natural history, and, though engaged in various business enterprises, throughout his life he devoted much time to scientific study. He was one of the four founders of the Entomological Club in London (1826), out of which, largely through his efforts, grew the Entomological Society (1833). In 1840 he established *The Entomologist*, which three years later he incorporated in *The Zoologist*, and this magazine he edited until 1863. Newman also founded

The Phytologist, to which he contributed from 1841 to 1854, and from 1858 until his death he was the natural history editor of the *Field*. Among his works are: *Grammar of Entomology* (2d ed. 1841); *History of British Ferns* (1840), an accurate work, illustrated by the author and subsequently greatly enlarged; *Birdnesting* (1861); an edition of Montagu's *Dictionary of British Birds* (1866); *Illustrated History of British Moths* (1869); and of *Butterflies* (1870-71). His contributions to the *Field* contain some of the first work done in economic entomology. Newman was one of the last of those general naturalists who have now given way to the specialist.

NEWMAN, FRANCIS (?-1660). An English colonist in America, Governor of New Haven Colony in 1658-59. He was born in England, and emigrated to New Hampshire in 1638, but after a few months removed to the Connecticut Valley, and became prominent in the affairs of the colony at New Haven. There he served as an ensign and lieutenant in the colonial militia or trained bands (1642-45), as secretary of the colony under Governor Theophilus Eaton (1646-47), and as a magistrate and assistant in 1653. In the latter year he was one of the commissioners sent from the Connecticut River towns to Manhattan to demand satisfaction of Peter Stuyvesant, Governor of New Netherlands, for injuries sustained by the English colonists at the hands of the Dutch. In July, 1654, he became one of the commissioners of the United Colonies of New England, and in May, 1658, he succeeded Eaton as Governor of the New Haven Colony, retaining the office until September, 1659.

NEWMAN, FRANCIS WILLIAM (1805-97). An English scholar and writer, brother of John Henry Newman. He was born in London, June 27, 1805, and, with his brothers, attended the school at Ealing. Thence he passed to Worcester College, Oxford, and in 1826 obtained a fellowship in Balliol College. He withdrew from the university in 1830, declining the subscription to the Thirty-nine Articles. After a tour in the East he was appointed classical tutor in Bristol College (1834). In 1840 he accepted a similar professorship in Manchester New College, and in 1846 was appointed to the chair of Latin in University College, London, which he held till 1869. During all this time he was an active contributor to literary and scientific periodicals, and maintained a leading part in the controversies on religion, in which he took the line directly opposite to that chosen by his elder brother, being no less ardent as a disciple of the extreme rationalistic school than John Henry Newman of the dogmatical. These opinions, and the system founded upon them, form the subject of his work, *Phases of Faith, or Passages from the History of My Creed* (1850); and the book constitutes a religious autobiography, recounting Newman's transformation from a Calvinist to a rationalistic theist. In 1849 he had published *The Soul, its Sorrows and its Aspirations*, a sympathetic though trenchant examination of man's spiritual nature in its relation to God. Probably for these two books, strongly personal and earnest and less eccentric than most of his other writings, Newman will be best remembered. He was extraordinarily versatile and treated his many subjects with marked enthusiasm and ability. Of his many publications, those re-

garding religious controversy, besides the two already mentioned, include: *Catholic Union: Essays Towards a Church of the Future* (1844); *A State Church Not Defensible* (1845). Political and social topics are represented by: *Radical Reforms, Financial and Organic* (1848); *Lectures on Political Economy* (1851); *On the State Provision for Vice* (1871); *Remedies for the Great Social Evil* (1889); *Europe of the Near Future* (1871). A large number are devoted to historical, classical, and scientific subjects, the most important of which are: *Contrasts of Ancient and Modern History* (1847); translations into 'unrhymed metre' of the *Odes of Horace* (1853), and the *Iliad of Homer* (1856); a treatise on *Difficulties of Elementary Geometry* (1841); *Handbook of Modern Arabic* (1868); *Orthoepy* (1869); *Miscellanies* (1869-89); *Dictionary of Modern Arabic* (1871); *Early History of Cardinal Newman* (1891). He died at Weston-super-Mare, October 4, 1897.

NEWMAN, HENRY RODERICK (1833—). An American water-color painter, born in New York City. He gave up the study of Medicine, to become an artist, at the age of eighteen years. He went to France in 1870, and, after traveling through Switzerland, settled in Venice (1871), and later removed his studio to Florence. Ruskin has expressed admiration for his works, which are good in technique. They consist mostly of architectural, landscape, and flower pieces. "Venice," "Tuscan Spring," "The Florence Cathedral," and "The Gulf of Spezia" are among his most celebrated paintings. His other works include: "A Study of Pink and White Oleanders," "Grapes and Olives," "Flowers," and "An Architectural Study."

NEWMAN, JOHN HENRY (1801-90). An English religious leader, first in the Church of England and later in the Roman Catholic Church. He was born in London, February 21, 1801, and educated first at a private school at Ealing, then at Trinity College, Oxford, which he entered when he was not quite sixteen. He won a scholarship two years later, and took his degree in 1820. In 1822 he was elected to a fellowship at Oriel, then the highest distinction of Oxford scholarship, which brought him into close relations with many of the most distinguished men of the time; among them was a brother fellow, Edward Bouverie Pusey, with whom he was to be most closely associated in the work of the Oxford Movement. He was ordained deacon in 1824, and combined with his college position the curacy of Saint Clement's Church. A year later, his friend Whately having become principal of Saint Alban's Hall, Newman was made vice-principal, but resigned the appointment on being named tutor in his own college (1826). In 1828, on the election of Hawkins as provost of Oriel (partly through Newman's influence, though Keble was also a candidate), Newman succeeded him as vicar of Saint Mary's, the university church, and the position which he thus gained gave him a commanding power, by the wonderful sermons which he preached in this pulpit, over a whole generation. He resigned his tutorship in 1832, owing to differences with Hawkins as to college arrangements. He made his first visit to the Continent soon afterward and returned in time to hear Keble's famous assize sermon on National Apostasy (July 14, 1833), which he always considered as the actual origin of the

Movement. (For the complete history of its development, see OXFORD MOVEMENT.) Here it is enough to say that from the first Newman was its acknowledged head; the charm of his personality, the ascetic fervor of his life, and the fame of his preaching gave him a tremendous power. He was one of the chief contributors to the *Tracts for the Times*, twenty-nine of which, including the famous No. 90, which proved the end of the series, are from his pen. The same year that witnessed their beginning (1833) saw the publication of his book on *The Arians*, which was followed in 1837 by *The Prophetic Office of the Church*; in 1838 by works on Justification, on the Canon of Scripture, and on Antichrist. In this year also Newman became editor of the *British Critic*, holding the position until 1841, and began in conjunction with Keble and Pusey to publish a Library of Translations from the Greek and Latin Fathers. On a formal request from the Bishop of Oxford, he discontinued the publication of the *Tracts* in 1841, after the storm of opposition which No. 90, "Remarks on Certain Passages in the XXXIX. Articles," had aroused.

Already in 1839 in the course of his study of the history of the Monophysite controversy a doubt had come to him whether, after all, the Anglican position was tenable; and the condemnation of his position by bishops and heads of colleges showed him that his place in the Movement was gone. Parallel reasoning on the history of the Arian controversy, and the curious compromise of the Jerusalem bishopric (see JERUSALEM), still further shook his allegiance to the Church of England.

In 1842 he retired from Oxford to the neighboring village of Littlemore, where he passed three years in seclusion, with a number of young men who had attached themselves to him, wrestling in silence with the problem thus presented to him. In the early part of 1842 he published a formal retraction of his adverse criticisms of the Roman Catholic Church, and in the following autumn, while he had not yet made up his mind, it seemed to him more honest to resign his living. The train of reasoning which occupied him throughout 1845, when he was engaged in the composition of his *Essay on the Development of Christian Doctrine*, finally brought him to the point, and on October 9th he became a Roman Catholic.

As his influence in Oxford and among thoughtful Anglicans had been tremendous, so the effect of this step was correspondingly great. A year after his reception he went to Rome and was there ordained priest. Soon afterwards he returned to England and introduced the Congregation of the Oratory (q.v.), which he thought specially adapted to the needs of the large towns. The greater part of his later life was spent in the house of the Oratory at Birmingham; from 1854 to 1858, however, he was in Dublin, as rector of the unsuccessful Catholic University there. Always deeply interested in education, he had planned to establish a house of the Oratory at Oxford, which might have allowed the young men of his Church to gain the advantages of the university; the project, opposed by Manning, fell through, but since his death his ideas have been vindicated by the establishment of a Catholic hall there. Constant literary activity marked all these years, of which the most remarkable fruits

were his *Letter to the Duke of Norfolk* (1875), in which he explained and defended the position of Catholics as affected by the Vatican decrees in their bearing on civil allegiance, in reply to Gladstone; and his memorable *Apologia pro Vita Sua* (1864), which contained a most striking account of the inner workings of his mind during his whole manhood, and increased the veneration felt for him by all his countrymen, of whatever shade of theological opinion. It grew out of a memorable controversy with Charles Kingsley, who, by general consent, had much the worse of the argument. In 1877 Newman was elected an honorary fellow of Trinity College, Oxford, and revisited his loved *alma mater* for the first time in twenty-two years. Leo XIII. created him a cardinal in 1879, allowing him still to reside in England. He died at Birmingham, August 11, 1890.

Both as a great spiritual force and as a master of literary expression, Newman will always deserve a large space in any history of nineteenth century England. His literary style, always pure, melodious, and elevated, and owing much to years of familiarity with the Authorized Version of the Bible, is full of undecaying beauty. But it was only an expression of his mental habit. The dialectical skill which marks all his controversial work was governed by the conscience whose supremacy he was never tired of enforcing; and the chaste beauty of his style was but the outcome of that intense realization of the spiritual world which is the most characteristic feature of all his teaching.

A complete list of his writings would occupy too much space. A uniform edition of the more important of them was published under his own supervision (London, 1868-81). Besides those already named, mention should be made of his: *Essay in Aid of a Grammar of Assent* (1870); two works of fiction, *Callista*, a *Sketch of the Third Century* (1856), and *Loss and Gain*, a story of Oxford life in his own day (1848); numerous volumes of sermons, all characterized by his qualities; and some extremely beautiful verse, of which the best, with "The Dream of Gerontius," is included in *Verses on Various Occasions* (1868). Consult, besides most of the books referred to under OXFORD MOVEMENT: *Letters and Correspondence of J. H. Newman During His Life in the English Church* (London, 1891); and sketches by R. H. Hutton (ib., 1891), Walters and Barrow (ib., 1901), and Whyte (New York, 1903); also an admirably thoughtful study of his writings in Shairp, *Studies in Poetry and Philosophy* (Edinburgh, 1866). His earlier life is also told by his brother Francis (London, 1891), and in *The Anglican Career of Cardinal Newman* (ib., 1892); his later, partly in Fitzgerald, *Fifty Years of Catholic Life and Progress* (ib., 1898).

NEWMAN, JOHN PHILIP (1826-99). An American clergyman, Bishop of the Methodist Episcopal Church. He was born in New York City, and educated at Cazenovia (N. Y.) Seminary, which he quitted in 1848 to enter the ministry. He followed the itinerant life of a Methodist clergyman until 1860, when he went abroad for travel and study, visiting Egypt and Palestine, subsequently embodying the results of this trip in *From Dan to Beersheba, or the Land of Promise as It Now Appears* (1864). After

New Orleans was taken by the Federal army in 1862, he was sent there to organize the Methodist Episcopal Church, and remained until 1869, meanwhile editing, in addition to his other labors, the *New Orleans Advocate*. Leaving New Orleans, he became pastor of the Metropolitan Church at Washington, D. C. His personality was a combination of clergyman and man of the world; his pulpit eloquence, which inclined rather to the grandiose, nevertheless won for him a large popularity both within and outside his denomination. At the end of his first pastorate in Washington in 1872, President Grant appointed him inspector of consulates in Asia, and in this capacity he made a tour of the world, which resulted in another work of travel, *The Thrones and Palaces of Babylon and Nineveh from the Persian Gulf to the Mediterranean* (1876). In 1878 he assumed a pastorate in New York City, and in 1881 was a delegate to the first Ecumenical Methodist Conference in London, where he read the invited essay on *Scriptural Holiness*, said to mark his highest achievement as a writer. From 1882 to 1884 he was acting pastor at the Madison Avenue Congregational Church, New York. In 1885 he returned to the pastorate of the Metropolitan Church, Washington, and in 1888 was elected bishop of the Methodist Episcopal Church, with his official residence at Omaha, Neb. In addition to the works mentioned, he published: *Christianity Triumphant* (1884); *Evenings with the Prophets on the Lost Empires* (1887); *The Supremacy of Law* (1890); *Conversations with Christ* (1901).

NEWMARKET. A market-town on the border of Suffolk and Cambridgeshire, England, 15 miles northeast of Cambridge (Map: England, G 4). The market-house and the celebrated Jockey Club are the chief edifices. The town owes its prosperity to the horse-races. The race-course of Newmarket, upward of four miles in length, is said to be the finest in the world, and the training ground bears a similar reputation for excellence. There are eight race-meetings held here annually. Population, in 1891, 8631; in 1901, 10,686. Consult Hore, *History of Newmarket and Annals of the Turf* (3 vols., London, 1886).

NEWMARKET. A town of York County, Ontario, Canada, 34 miles north of Toronto on the Northern Railway (Map: Ontario, D 3). It has busy trading interests and some manufactures. Population, in 1891, 2143; in 1901, 2125.

NEW MECKLENBURG (formerly New Ireland). The second largest of the Bismarck Archipelago (q.v.), situated in the Pacific Ocean, 350 miles northeast of New Guinea, and separated from New Pomerania, the largest of the group, by Saint George Channel (Map: Australasia, H 3). It is elongated, has an area of 4920 square miles, and consists for the most part of mountains covered with forests of large trees. Little is known of the interior of the island, but the coast lands are very fertile. Colonization of the island has been unsuccessful; there is a trading station on the north coast, but in 1897 there were only nine European inhabitants, the bulk of the population, whose number is unknown, being savage Melanesians.

NEW MEXICO. A southwestern Territory of the United States. It lies between latitudes Vol. XIV.—30.

31° 20' and 37° north, longitudes 103° 2' and 109° 2' west, and is bounded on the north by Colorado, on the east by Oklahoma and Texas, on the south by Texas and Mexico, and on the west by Arizona. It forms almost a perfect square, the line being somewhat broken on the southern boundary. The length along the western boundary is 400 miles; the greatest width, 358 miles. Area, 122,580 square miles. New Mexico exceeds in size every State in the Union except Texas, California, and Montana.

TOPOGRAPHY. The whole Territory is very elevated, only a small portion in the south lying below 4000 feet. The topography may be divided into several more or less well marked regions, running north and south. The eastern third of the Territory belongs to the Great Plains, which skirt the whole eastern base of the Rocky Mountains. In the northeastern part of the Territory this plain is watered by the Canadian River, south of which it slopes gradually into the level and arid plateau known as the Llano Estacado. West of this is the valley of the Pecos River, the lowest part of the Territory, falling near the southern boundary below 3000 feet. From the Pecos Valley the land rises westward into the Front Range of the Rocky Mountains, which issues from Colorado in a continuous line of lofty peaks, several of which are over 12,000 feet high. Toward the centre of the Territory the range becomes broken into isolated groups and mesas inclosing in the north park-like grassy plains, but toward the south arid and desolate valleys filled with lava beds and salt marshes. West of the Front Range is the narrow valley of the Rio Grande, traversing the whole length of the Territory. Finally, through the western part of the Territory stretches the great, broad plateau, the Continental Divide, which extends into Mexico as the Sierra Madre. Its average height is 7000 feet, though it sinks to 5000 feet in the south, and it is diversified by a number of mesas and isolated ranges from 8000 to 11,000 feet high.

CLIMATE AND VEGETATION. The climate is remarkably dry and healthful, and the air pure and clear. In the lower regions of the south the climate is mild throughout the year, but in the north the temperature sometimes falls below zero. At Santa Fe the mean temperature for the year is about 50°, for the warmest month 70°, and for the coldest 30°. The average rainfall for the whole Territory is about 15 inches, being nowhere sufficient for the needs of agriculture. Many of the mountain basins and river valleys are covered with nutritious grasses, one of the most common genera being the grama-grass (*Bouteloua*). The salt-grass (*Distichlis spicata*) often forms a dense sod over the alkali flats which abound especially on the western plateau. Bunch grasses cover many of the mesas and mountain slopes, but the sage brush is predominant in many of the plains, and the plateau toward the west becomes arid and desolate. Sycamore, cottonwood, oak, and other deciduous trees grow in the river-valleys, and some of the foothills carry growths of piñon and dwarf cedar, while extensive forests of pine, spruce, and cedar cover the higher mountains. With the possible exception of the alkali flats, the soil, wherever there is any, is said to be fertile and capable of becoming productive when irrigated.

For flora and fauna, see these sections in the article UNITED STATES.

GEOLOGY. The mountain ranges are generally upheavals of a nucleus of granite and syenite which has broken through the Paleozoic sandstones and Carboniferous limestone, these strata being upturned and exposed along their bases and slopes. The eastern plains are almost wholly Cretaceous, and the same formation occurs in the northern part of the western plateau. Intrusions of eruptive rocks are found in profusion in many parts of the Territory; these range from ancient volcanic rocks and dikes of porphyry to more recent lava flows which cover considerable areas both on the plateaus and in the valleys.

MINING. This industry is but little developed in comparison with its great possibilities. The mineral region is almost co-extensive with the mountain region. Coal and gold are among the minerals most mined. The output of the former increased from 157,092 short tons in 1882 to 1,086,546 short tons in 1901. The output of the latter shows an increase from 26,074 fine ounces in 1898 to 33,302 in 1901. The output of silver and copper, which had decreased for a number of years, has grown extraordinarily, the output of the former in 1901 being 563,400 fine ounces, as against 425,300 in 1898, and that of the latter having increased from 31,884 pounds in 1894 to 9,629,884 in 1901. Emeralds, turquoise, and other precious stones are being mined in increasing quantities. Other minerals produced are lead, iron, gypsum, kaolin, and fire clays.

FORESTS. The wooded area is given as 23,700 square miles. The United States has reserved tracts amounting to 4299 square miles, mostly about the head of the Gila River. The merchantable timber is found only in the mountainous regions, and is mainly yellow pine and spruce.

AGRICULTURE. Irrigation is practicable and in practice along the water-courses. However, the possibilities of irrigation in New Mexico are not as vast as in some other Western commonwealths, owing to the comparative lack of large rivers and lakes. The irrigated areas are scattered throughout the Territory and are not large in any particular region. The Rio Grande River supplies water for a greater area than any other stream. Owing to evaporation and the use of the water in irrigation, this stream becomes dry in the southern part of the Territory during the irrigation season. Much water is wasted by the primitive system of irrigation employed by the Indians and Mexicans. There is a considerable irrigated area on the San Juan River in the northwest. Irrigation has not been introduced until recently in the eastern plain region. In 1899 there were 975 irrigation ditches with an aggregate length of 2382 miles. Their construction cost \$4,140,319. There were under ditch 646,784 acres, of which 203,893 acres were irrigated, and 182,804 acres were in crops. The total area included in farms (both agricultural and stock) in 1900 was 5,130,878 acres, more than six times as great as the corresponding area in 1890.

Alfalfa is the most important crop. Wheat, corn, and other cereals are grown in fair quantities. The Rio Grande Valley produces a superior quality of grapes. Most of the temperate zone fruits are grown. New Mexico can produce sugar beets of the highest grade. The following table of acreages explains itself:

	1900	1890
Corn.....	41,345	26,589
Wheat.....	37,907	21,863
Oats.....	15,848	9,314
Beans.....	3,349	
Pease.....	2,220	
Hay and forage.....	87,358	26,375

STOCK-RAISING. New Mexico claims the possession of a combination of favorable conditions—mild climate, etc.—unrivalled for purposes of sheep-raising. This industry, ever since the advent of the Spaniards, has been of first importance. The number of sheep decreased between 1880 and 1890, but increased enormously in the following decade. There has also been a marked gain in the number of cattle and of horses. The grazing region is chiefly in the eastern part, where there is an abundance of 'mesquite' and other varieties of native grasses. Very little grazing is afforded in the arid tablelands west of the Rio Grande Valley. The following table shows the leading stock holdings:

	1900	1890
Dairy cows.....	16,775	18,507
Other cattle.....	975,084	669,004
Horses.....	151,163	38,130
Mules and asses.....	21,213	8,367
Sheep.....	3,333,743	1,248,970
Swine.....	20,426	10,471

MANUFACTURES. The manufacturing interests are small, but had a marked growth between 1890 and 1900. In 1890 there were 127 establishments with \$965,938 capital, as against 420 with \$2,698,786 capital in 1900. Railroad repair shops were the most important establishments. The large sheep-raising interests explain the introduction of wool-scouring establishments, of which four were erected during the decade.

TRANSPORTATION. The Atchison, Topeka and Santa Fe Railroad traverses the Territory from north to south, following the course of the Rio Grande. The Santa Fe Pacific branch of the above railroad connects the Territory with the Pacific Coast. The Southern Pacific crosses the southern portion of the Territory, and the Pecos Valley and the El Paso and Northeastern railroads have recently been constructed through the eastern part. In 1900 the total number of miles was 1779. There are no navigable streams.

BANKS. The first bank in the Territory was a national bank organized in 1871. In 1888 some banks were organized under the Territorial laws. The Territorial banking law provides for yearly reports and examinations. In 1902 there were 15 national banks, with a capital of \$1,012,000; surplus, \$171,000; cash, etc., \$430,000; deposits, \$5,033,000; and loans, \$3,688,000; and 12 Territorial banks, with capital of \$417,000; surplus, \$52,000; cash, etc., \$148,000; deposits, \$1,783,000; and loans, \$1,354,000.

GOVERNMENT. New Mexico has the usual Territorial form of government. See **TERRITORIES.**

FINANCES. A public debt of \$200,000 was created in 1884 to construct the Capitol. Later more bonds were issued for the erection of a penitentiary and other public buildings. There was also a constant deficit due to high expenditures, and also to the difficulty of collecting taxes, of which about 25 per cent. usually remain unpaid. In 1889 a movement for financial reform gained headway, and the expenditures

† The organization of Torrance County is to be completed January 1, 1905.

were decreased by about 50 per cent. Since then the public debt has been somewhat diminished. At the end of 1901 it was \$1,180,000. The receipts for 1901 were \$540,795, and disbursements \$465,815, leaving a surplus of \$74,920.

MILITIA. In 1900 the men of militia age numbered 41,464. The number of militia in 1901 was 612.

POPULATION. The population increased from 61,547 in 1850 to 91,874 in 1870, 153,953 in 1890, and 195,310 in 1900. The foreign-born in the last year numbered 13,625, of whom 6649 were Mexicans. The Indian population numbered 13,144, and the negroes 1610. A large part of the population are descendants of the original settlers, who were of Spanish or of mixed blood. Albuquerque, the largest town, had in 1900 a population of 6238; Santa Fe, the capital, 5003; and Las Vegas, 3552.

RELIGION AND EDUCATION. The bulk of the population belong to the Roman Catholic Church. According to the census of 1900 the percentage of illiteracy was greater than that of any other State or Territory. With a compulsory school law, and greatly increased expenditures for school purposes, and the lengthening of the school year, illiteracy is diminishing. The percentage decreased from 44.5 in 1890 to 33.2 in 1900. In 1890 61 per cent. of the population could not speak English. This figure for 1900 became also greatly reduced. In 1898-99 there was raised \$414,653 for Territorial schools and institutions, as against \$85,129 in 1891; the number of teachers increased from 407 to 706; and the school term lengthened from three months in 1891 to four months in 1899. The Territorial institutions for advanced learning are: University of New Mexico, at Albuquerque; New Mexico College of Agriculture and Mechanic Arts, at Mesilla Park; School of Mines, at Socorro; Normal School of Silver City, at Silver City; New Mexico Military Institute, at Roswell; New Mexico Normal University, at Las Vegas. The Catholic Church supports eighteen schools; the Methodist Church, eleven; the New West Educational Commission, five; and the Presbyterian Church, twenty-five. Furthermore, the United States has schools for Indians, including the Indian Industrial School at Santa Fe.

CHARITABLE AND PENAL INSTITUTIONS. There are a school for deaf, dumb, and blind, and a penitentiary at Santa Fe, and an insane asylum at East Las Vegas.

HISTORY. The first explorers of the region were Spanish. Cabeça de Vaca visited it in 1536, and Coronado (q.v.) in 1540-42. Espejo wandered over much of it in 1582-83. In 1598 Juan de Oñate conquered the inhabitants, who were Pueblo Indians, and not Aztecs, as often erroneously stated. Santa Fe was founded between 1605 and 1616. The Indians revolted about 1680, and kept their independence for ten years. The mines were worked and towns and missions were founded. This region became a province of Mexico when that country gained its independence of Spain in 1821. In June, 1846, Col. Stephen W. Kearny marched from Fort Leavenworth with a force composed of United States dragoons and Missouri volunteers, and occupied Santa Fe on August 18th. The whole Territory was declared a part of the United States. (See PRICE, STERLING.) The Territory of New

Mexico formed a part of the Mexican cession by the Treaty of Guadalupe Hidalgo, February 2, 1848. The act of organization was passed September 9, 1850, and went into effect in March, 1851. The original boundaries included that part of the territory of the United States north of the Mexican line, west of Texas, east of California, and south of 37°, including, however, the territory north of 37° and south of the Arkansas River. In 1853 the Gadsden Purchase (q.v.) was added and Arizona was set off in 1863. The portion north of 37° was added to Colorado in 1867. In 1850 a convention was held and a State constitution adopted, but the dread on the part of the North of another slave State prevented the admission of New Mexico. Frequent efforts to secure admission have been made since. In 1894 Congress passed an enabling act, and in the Fifty-seventh Congress (1901-03) an act of admission passed the House, but did not reach a vote in the Senate. During the Civil War New Mexico was invaded in December, 1861, by Texas Rangers, who took possession of the Territory, but were forced to retire in April, 1862, by regular troops under Colonel Canby and a regiment of Colorado volunteers. Since that time there have been Indian outbreaks, which have been suppressed with difficulty. The following have been Governors of the Territory of New Mexico:

GOVERNORS

NEW MEXICO, UNIVERSITY OF. A coeducational institution of higher learning at Albuquerque, New Mexico, incorporated by an act of the Territorial Legislature in 1889, and indicated by statute as the future State university. The collegiate, normal, and preparatory departments were opened in 1892. Science, music, art,

and commercial schools were afterwards added. The degrees of bachelor of arts and pedagogy, of master of arts and sciences, and of doctor of philosophy are conferred. The Hadley Climatological Laboratory is an organization for research especially with reference to the influence of the climate of the arid and plateau region of the United States upon disease. The students in 1902 numbered 150 and the faculty twelve. The library contained about 5000 volumes. The campus contains the Administration Hall, Hadley Science Hall, the gymnasium, and the Ladies' Cottage. The total value of property under control of the college in 1902 was \$75,000. Its endowment consisted of 243,000 acres of public land and 150,000 acres of saline land, and the income was \$15,000.

NEW MEXICO COLLEGE OF AGRICULTURE AND MECHANIC ARTS. A coeducational State institution at Mesilla Park, N. M., established in 1889. It is supported mainly by a Territorial tax and by the Morrill and Hatch funds. The moneys received from the Federal Government amount to \$40,000 annually. In 1902 its income from all sources was \$48,147, its grounds and buildings were valued at \$45,000 and the whole amount of college property at \$100,500. The library contained 10,000 volumes. The instructors, of whom six were women, numbered twenty-five, and there were 163 collegiate and special students, and 144 in the preparatory department.

NEW MILFORD. A town, including several villages, and a county-seat of Litchfield County, Conn., 15 miles north of Danbury; on the Housatonic River, and on the New York, New Haven and Hartford Railroad (Map: Connecticut, B 3). It has a public library with about 3400 volumes, and Rectory and Ingleside schools, both Protestant Episcopal. There are several large tobacco warehouses, and manufactories of hats, carbonized stone and sewer pipe, lime, pottery, and paints. Population, in 1890, 3917; in 1900, 4804.

NEW MODEL, THE. The name of the Parliamentary Army in the great English Civil War, after its reorganization under the ordinance of February 15, 1645. The pattern was provided by Cromwell's Ironsides. There was no longer to be a division of responsibility, but all authority was concentrated in the hands of the new commander-in-chief, Lord Thomas Fairfax (q.v.). Cromwell became the lieutenant-general. Parliament had freed the army from Essex and Manchester by the Self-Denying Ordinance (q.v.). Consult Gardiner, *History of the Great Civil War*, vol. i. (London, 1886). See CROMWELL, OLIVER.

NEWMAN, nū'nān. A city and the county-seat of Coweta County, Ga., 39 miles south by west of Atlanta; on the Atlanta and West Point and the Central of Georgia railroads (Map: Georgia, B 2). It is the centre of a productive fruit-growing and farming region, and has a large trade in cotton. The chief industrial establishments include canning and cigar factories, cotton and cottonseed-oil mills, foundries and machine shops, and manufactories of phosphates, fertilizers, etc. The water-works are owned by the municipality. Population, in 1890, 2859; in 1900, 3654.

NEW NETHERLAND. The original name of the Dutch colony afterwards called New York.

NEWHAM COLLEGE. An institution for the higher education of women, situated at Cambridge, England. It had its inception in the amalgamation in 1880 of the Association for Promoting the Higher Education of Women in Cambridge, organized in 1873, with the Newnham Hall Company, opened in 1875. As early as 1871 five women students came to Cambridge to study under the direction of Miss Clough, subsequently principal of Newnham College. This number increased to twenty-five by 1874. The growth of the college has continued steadily, and in 1902 it included North Hall, established in 1880; Clough Hall, 1888; and the Pfeiffer Building, 1893. The library contains about 8000 volumes. The attendance in 1902 was 174. The faculty included 15 resident and 37 non-resident tutors. With certain restrictions the students have since 1881 enjoyed all the scholastic privileges offered at the University of Cambridge. Their names appear in the tripos or honor list in the university calendar. They do not, however, receive degrees, but are granted certificates instead.

NEW ORLEANS, ōr'lē-ānz. The largest city in Louisiana, and, with the exception of Natchitoches, the oldest. It is situated on both banks of the Mississippi, 107 miles from its mouth, in latitude 29° 58' N., and longitude 90° 04' W. (Map: Louisiana, F 4). Its distance from Washington in direct line is 960 miles; from Saint Louis by rail, 639; and from Chicago by rail, 923. The city proper occupies a strip of land between the river and Lakes Maurepas and Pontchartrain, with the latter of which it is connected by two canals. The corporate limits of the city embrace the whole parish of Orleans and a portion of Jefferson on the right bank (the town of Algiers, or Fifth District). The official boundaries thus inclose an area of 191 square miles, though the inhabited portion covers only about 37 square miles. The city lies about ten feet below the level of the Gulf, and is so far below the level of high water in the Mississippi that it is protected from overflows by levees twenty feet high in places. Its sobriquet, the 'Crescent City,' is derived from the fact that the original city followed the curve of the river in front of the old Place D'Armes; but as the inhabited portion has been gradually extended, its shape more nearly resembles the letter S. It has a frontage of more than twelve miles on the river, which is about half a mile wide in front of Canal Street and from 40 to 200 feet deep.

Canal Street, 200 feet broad, is the great business thoroughfare, and cuts the city in two, the portion below being known as the French Quarter, or *Vieux Carré*, and the portion above as the American Quarter. The French portion, with its narrow streets, its occasional tiled roofs, its old cathedral, its Spanish city hall or Cabildo, and its porte-cochères, is far more picturesque than the American Quarter, which contains the great business houses, the banks, and also the handsomest private dwellings. In the French Quarter, however, many beautiful residences, surrounded by flowers and semi-tropical plants, are to be seen on Esplanade Avenue. Here dwell the old Creole families, descendants of the early French or Spanish settlers; here French is still spoken

as a mother tongue, and though there has been much intermarrying and social intercourse with Americans, French customs are still observed, and visitors feel as if they had happened upon an aristocratic faubourg of Paris. Traces, also, of the Spanish régime are to be found in many interesting specimens of the Hispano-Moresque style of architecture, which, with the red-tiled Spanish houses and the exquisite wrought-iron of the balconies, make this portion of the city unique. Above Canal Street the principal residence streets are Saint Charles Avenue and Prytania Street. These stretch for miles through the prettiest section of the city. Here are the most beautiful gardens. The palm, the palmetto, the fig, the orange, and the magnolia grow in tropical abundance, and even in winter the atmosphere is often perfumed with the odor of roses, violets, and sweet olive. Owing to the curve of the river, the streets do not run at right angles; they follow what is sometimes called 'the line of beauty.' Between the main thoroughfares of this portion of the city are interpolated a number of small streets, which, seeming to begin nowhere and end nowhere, cause great perplexity to strangers. The total extent of streets is 700 miles, of which only 204 miles are paved at all. The lack of paving, resulting in the disuse of the unpaved streets, which in bad weather become almost impassable, has a tendency to congest traffic on the few streets that are paved. The street railways cover a total mileage of 176. Recently they have been consolidated under one company. A belt line, twelve miles long, extends around the most attractive portion of the city. There is also an electric line connecting with West End, a suburban resort, nearly seven miles from the head of Canal Street.

CLIMATE. The Weather Bureau reports have been carefully kept for the last thirty-two years. They show that the average rainfall is 58.01 inches. In winter there is generally some ice and occasionally snow. The summers are long, but the heat is seldom excessive, and prostrations are rare. The average annual relative humidity is 74 per cent. The large surrounding bodies of water render the climate more equable than in the interior. The annual mean temperature is 69°. In thirty-two years the temperature has never reached 100°, except in 1901.

BUILDINGS. Among the secular buildings of New Orleans, the most interesting is the Cabildo (now the Supreme Court building). It was built at the expense of the Government near the close of the eighteenth century, during the Spanish régime. In it the formal transfer of the Province of Louisiana from Spain to France and from France to the United States took place with elaborate ceremonies in 1803. Other notable structures are the Custom House and Post Office building (cost \$5,000,000), which is of massive granite, but not beautiful as to architecture; the City Hall, of Ionic order, and modeled after a Greek temple; the new Court House; the New Saint Charles Hotel, one of the most famous hostelries in the South; the Howard Memorial Library; Gibson Hall (a part of Tulane University); the Charity Hospital; the Medical College; the Milliken Memorial Hospital; the Harmony Club (an aristocratic Jewish association); the Cotton Exchange; the Sugar Exchange; the Athenæum; the Jewish Orphans' Home; and the new Tilton Memorial Library

(also a portion of Tulane University). Among the splendid office buildings that are rapidly rising in the business centre of the city may be mentioned the Hennen building, the Liverpool and London and Globe, the Morris, the Masonic Temple, and the Tulane-Newcomb. Of the ecclesiastical edifices the most prominent are the Saint Louis Cathedral (Catholic), in which General Jackson attended services after his great victory at Chalmette in 1815; the Archbishop's Palace (1730), the oldest building in the Mississippi Valley; the Church of the Immaculate Conception, Saint Joseph's Church, the First Presbyterian, Christ Church Cathedral (Episcopal), Trinity Church, Saint Paul's, Temple Sinai and Touro synagogues, the Prytania Street (Presbyterian) Church, and the Coliseum Place (Baptist) Church.

PARKS. The total park area of the city is 742.66 acres. The two largest and most interesting parks are the City Park and Audubon Park, which are both being rapidly improved. City Park, which is situated on Metairie road, between the city and the lake, contains 160 acres. It was formerly a plantation, and beneath its ancestral oaks, draped with festoons of Spanish moss, occurred nearly all the famous duels which were a marked feature of Creole life before the Civil War. Dueling has now passed away. In this park young men find amusement in golf and polo. Portions of it are still wild. Audubon Park, in the upper portion of the city, contains 249 acres, and was also a plantation in days gone by. It was here that in 1796 the first successful attempt was made to granulate sugar—marking an epoch in the industrial history of the State. Its superb live oaks, its miniature lakes, and its great greenhouse, 300 feet long, and full of rare tropical plants, make this park a favorite resort. It also contains an interesting sugar experiment station, supported by the State. Besides these parks, there are two squares that attract attention on account of historical associations. These are Congo Square (now Beauregard Square) and Jackson Square. The former was in old times the resort of the slaves, and here they assembled for their wild dances to the sound of bones and drums. Jackson Square was not only associated with the exciting events that occurred in connection with the two transfers of the province in 1803, but was also the scene of the triumphal entry into the city of General Jackson after the Battle of New Orleans. The square contains a fine equestrian statue of General Jackson, by Clark Mills. Flanked by the old cathedral and the court buildings on one side and by the fine Pontalba rows on the other two sides, this square is regarded as one of the most symmetrical and beautiful public places in the United States. Near the square is the French market, which is one of the 'sights' of New Orleans. Visitors crowd to it early Sunday mornings to listen to the babel of tongues—French, Spanish, Italian, Creole patois, and English—to drink 'café noir,' and to buy *gombo filé* (pounded sassafras) and baskets of the Choctaw Indians, who still frequent it.

CEMETERIES. There are a number of cemeteries in various portions of the city. The most interesting are the Catholic cemeteries, of which the oldest is Saint Louis No. 1, and the most curious is Saint Roch's Campo Santo. The handsomest cemetery is the Metairie, which contains, among

its fine monuments, the tomb of the Army of Tennessee, surmounted by the splendid equestrian statue of Gen. Albert Sidney Johnston. As it is not possible in New Orleans to dig much below the surface without finding water, the curious custom prevails of burying in vaults, or 'ovens,' rising in tiers sometimes eight feet above the ground line. Jews, however, bury beneath the ground, as do some of the poorer classes. On All Saints' Day (November 1st), which is a general holiday in the city, the Catholics visit the cemeteries and decorate the tombs of the dead.

PUBLIC INSTITUTIONS. While New Orleans has no such enormous libraries as are found in some of the Northern cities, it is fortunate in possessing several of importance. Among the smaller ones of a quasi-public character should be mentioned those owned by the Jesuits' College, the Tulane Medical College, the Parish Medical Society, the New Orleans Bar Association, and the H. Sophie Newcomb Memorial College. The larger libraries are the State Library, with about 25,000 volumes; the Tilton Memorial Library of Tulane University, with 20,000 volumes and 2000 pamphlets; the Howard Memorial, with 45,000 volumes and 12,000 pamphlets; and the New Orleans Public Library, with 52,000 catalogued and 10,000 uncatalogued books. The Howard Memorial, which is privately endowed, is a reference library, and has perhaps the best collection in the world of books concerning the history of the Mississippi Valley. The Public Library, embracing the former Fisk and Lyceum libraries, has an increasing circulation, amounting in 1902 to 110,000 volumes. There are also in the city three private libraries containing valuable collections of original documents on American history. In the Howard Memorial Hall are a number of interesting relics of the Civil War. Andrew Carnegie offered the city \$250,000 to erect a new library building with branches, and the offer has been accepted.

CHARITABLE INSTITUTIONS. The city is rich in such institutions. The principal one is the Charity Hospital, built in 1832. It treats about 5000 patients every year, without charge. It receives from the State \$95,000 annually, with additional sums for improvement of buildings, etc., and is controlled by a board appointed by the Governor. The city supports a home for aged and infirm, a house of refuge for boys, and an insane asylum. There is also an eye, ear, nose, and throat hospital, maintained by private contributions. The Jews have several well-organized charitable institutions, among which the principal are the Jewish Orphans' Home and the Home for Aged and Infirm Jews. The Touro Infirmary, endowed by a wealthy Hebrew philanthropist, has a free clinic, where the poor of all sects are treated. The Catholics have the most numerous charitable institutions under their control. The most prominent are the Poydras Asylum, the New Orleans Female Orphan Asylum, Saint Vincent's Infant Asylum, and the House of the Good Shepherd. There are also for colored people a Boys' Home and a Home for the Aged, founded by a colored philanthropist. Of recent foundation is the Kingsley House, modeled after the famous Hull House of Chicago. It is supported by private subscriptions. Finally, the Charity Organization Society has undertaken to organize the many charities of the city, and by the careful investigation of its agents to prevent pauperization.

EDUCATIONAL INSTITUTIONS. The organization of the public school system is thorough and complete. A large number of the handsome school-houses of the city were built from the income of a fund given by a former citizen, John McDonogh, which now amounts to about \$800,000. The city makes such appropriations for the public schools as it thinks proper, but it cannot appropriate less than eight-tenths of a mill for any one year. Besides this appropriation it receives its share of the current school fund collected by the State. There are no 'mixed' schools. The number of public schools for whites is 61, and for negroes 12. The number of teachers is 800 white and colored. The total enrollment for 1902 was 31,205, of whom 26,133 were white and 5072 were colored. The public school system consists of one normal, three high, 68 grammar and primary, 18 kindergarten, one teachers' practice school, and one teachers' kindergarten training school. These schools occupy 69 buildings, 32 of which were erected by the city, 28 by the commissioners of the McDonogh fund, and two donated. The total cost of maintaining the schools per annum is \$510,573. The estimated expenditure for each pupil is \$16.36. Free instruction is also given to young children by six kindergartens, supported partly by churches and partly by private funds. The number of private schools in the city is 145 for whites and 14 for negroes. Among the most prominent colleges may be mentioned the College of the Immaculate Conception (established by the Jesuit Fathers in 1847); the Soulé Commercial and Literary Institute (established 1856); Spencer's Business College and Institute of Shorthand (established 1897); the Blake Institute; and the Home Institute (established in 1883). The last-named institution, besides its regular work, conducts a free night school, in which instruction is given to nearly 1300 men and boys. For the education of the colored youth there are four universities, or more properly colleges: Leland University (1870), Straight University (1870), New Orleans University (1873), and the Southern University (1881). Only the last of these is supported by the funds of the State. For the whites there is only one university, the Tulane University of Louisiana (q.v.), with the H. Sophie Newcomb Memorial College for Women.

AMUSEMENTS. New Orleans is famous for its French opera. For forty years before the Civil War troupes were brought over from France to furnish this entertainment, and with brief intervals the custom has prevailed ever since. Such is the passion for music and singing, especially among the Creoles, that even in times of great financial depression the city has managed by private subscription to support these foreign companies. No other city in the Union has shown equal enthusiasm. Thousands of visitors are attracted to the city during the winter season by the opera; but a still greater attraction for many years has been the Carnival celebration. As early as 1840 tableaux on floats were drawn through the streets, and, except during the Civil War, the custom has continued to the present day. These superb pageants are now given by four secret organizations—Momus, Proteus, Rex, and Comus—and each is followed at night by a gorgeous ball. Other secret organizations have sprung into being of late years, and the series of masked balls now extends with brief intervals from Twelfth Night

Canals

to Mardi Gras, or Shrove Tuesday. When the morning of Ash Wednesday dawns every vestige of this prolonged revelry has vanished. The subjects represented in the parades are drawn from mythology, romance, and history. The floats are designed by artists of established reputation, who, with their assistants, spend many months in elaborating them. The expense of these parades is about \$200,000 a year. Nowhere else in the world are similar pageants to be seen.

CLUBS. The principal social clubs of New Orleans are the Boston, the Pickwick, the Chess, Checkers and Whist, the Harmony, the Louisiana, the Era (a women's club), the Round Table, the Variété, and the Southern Yacht Club. The Louisiana Historical Society devotes itself to the investigation and preservation of the history of the State, while the *Athénée Louisianais* was founded for the study and preservation of the French language.

DRAINAGE AND SEWERAGE. The surface of the city being entirely flat, with the exception of Metairie Ridge, which has an elevation of about two feet, the problem of drainage and sewerage has been a perplexing one ever since the founding of New Orleans. The average rainfall being 58 inches, tropical downpours are not infrequent, and they sometimes flood the principal streets to the depth of several feet. To this inconvenience is added the fact that strong winds often force the waters of Lake Pontchartrain over the rear of the city, and keep it submerged for several days. Various plans for draining the city were tried, but they all failed. Finally the city appropriated for this purpose a large amount of money derived from the sale of street railway franchises, and under a drainage board appointed in 1896 the immense work of digging canals and establishing pumping stations was begun. Much yet remains to be done, but the system as far as completed was put into practical operation in March, 1900. Meanwhile (1899), the property owners of the city voted a special tax of two mills to run forty-two years to provide the necessary funds for "sewerage, drainage, and municipal water-works." A new board was then appointed, but a troublesome litigation in the courts tied its hands for many months. Recent decisions of the courts, however, in favor of the city give promise of speedy and successful execution of this great work. At present New Orleans is insufficiently supplied with river water, and a large majority of the inhabitants depend upon rain water, collected in great wooden vats or cisterns, which, rising nearly as high as the houses, form a unique feature of the city.

HEALTH. New Orleans has always been subject, at intervals, to visitations of yellow fever, and its sanitary reputation has been thereby seriously impaired. Before the Civil War the worst epidemics were those of 1832, when more than 8000, out of a population of about 55,000, died of yellow fever and cholera; of 1847, when nearly 2500 died of yellow fever alone; and of 1853—the 'Great Epidemic'—when fully 16,000 died from yellow fever and other causes. In 1878 there was one which carried off 4000 persons in Louisiana. In 1882, however, a thorough system of disinfecting vessels was established at the mouth of the Mississippi, and for fifteen years the fever was kept outside the boundaries of the State. In 1897 it was again introduced from a town in a neighboring State, where the disease had pre-

vailed for some time without being recognized. In that year, according to the official report, there were in Louisiana 1935 cases, most of them in New Orleans, but the total number of deaths was only 306. In the two subsequent years the disease appeared again, but still in a very mild form and with a low rate of mortality. In 1853 the death rate per 1000 of the population from yellow fever alone was 50.9; in 1854 it was 15.4; in 1878, 19.20; in 1897, 1.90; in 1898, .20; and in 1899, only .07. Hence the city board of health has declared that "this once dreaded disease is no longer worthy of a place of dignity in our statistics as a life destroyer." It may be added that the general cleaning up that has been given by the United States to the city of Havana is regarded as an important protective measure for New Orleans. Finally, the mildness of the climate of New Orleans, and the outdoor life which such a climate renders possible, preserve the inhabitants to a large extent from many of the terrible diseases common in other cities. The mortality among the colored population, which is generally improvident and careless of sanitation, is much higher than among the whites.

INDUSTRY AND COMMERCE. As a manufacturing centre New Orleans has many advantages, among which may be mentioned the following: The climate is moist enough for cotton manufacture and favorable for continuous labor throughout the year; the raw materials need but short transportation; the laboring class is numerous and contented; fuel is brought cheaply by water; and the exporting facilities are excellent. It is estimated that in the last twenty-five years the value of the products of factories in the city has increased six fold. The chief industries are rice cleaning and sugar refining, and the manufacturing of boots and shoes, furniture, men's clothing, cotton goods, tobacco, cigars, and cigarettes, cottonseed oil, and planing-mill products. The last census (1900) gives the number of wage-earners in all industries as 19,435; the total wages paid as \$7,645,167; and the value of the total output as \$63,514,505. The value of all products in 1890 was only \$48,234,924. There are in the city 1624 manufacturing enterprises, devoted to 150 different industries, with a total capital of \$52,000,000. The United States Government recently constructed at New Orleans one of the largest floating dry docks in the world. This has shown its ability to lift and sustain the largest ship in the American Navy. New Orleans is the second export city in the Union, being excelled only by New York. Six great railroad lines, with a total mileage of 26,881, have their terminus here. These are the Southern Pacific, Illinois Central, Louisville and Nashville, Texas and Pacific, Southern, and the Queen and Crescent. The last two enter New Orleans over the tracks of another line. There are six great grain elevators along the docks. The docks, which are for the most part uncovered, extend for six miles along the left bank. As the gateway of the Mississippi Valley the city is well situated for foreign commerce. The jetties at the mouth of the river give a channel of about thirty feet, and the depth of the river in front of the city is ample for the largest vessels. Direct lines of steamships connect with New York, the West Indies, Central America, and Europe, and there is even a direct line via the Suez Canal to Japanese ports,

carrying raw cotton for manufacture. At present there are thirty steamship lines connecting New Orleans with the principal ports of the world. As soon as the Isthmian Canal is built a great impetus will be given to the commerce of the city. The foreign trade consists very largely of exports, the annual value of which is about \$150,000,000. The imports, however, are increasing, being over \$23,000,000 for the ten months ending April, 1903.

GOVERNMENT. In 1896 the present charter of the city was granted by the Legislature. It is largely in accord with the suggestions of the Municipal Reform League of America, and is in many respects a radical departure from the previous charters. The executive powers are vested in a mayor, a controller, a treasurer, a commissioner of police and public works, and a city engineer. The first three are elected for four years, while the rest are appointed by the mayor with the consent of the council. As has been the custom in other great cities of late years, large appointive power is vested in the mayor, who is held responsible for his appointees. The only exception made is in the case of the keepers of the people's money. The council, which is unicameral, is elected for four years. By an unusual provision, each member receives a salary of \$20 a month if he has attended all meetings. The granting of franchises, the usual pitfall of councils, is carefully safeguarded. Connected with the city government proper, but in some respects largely independent of it, are a number of boards, with various functions, such as the civil service commission, the board of liquidation of the city debt, the police board, the board of fire commissioners, the school board, the board of health, the New Orleans levee board, the port commission, the drainage commission, and the water and sewerage board. Besides the numerous city courts, the State Supreme Court, the United States District, the Circuit Court, and the Circuit Court of Appeals hold sessions in New Orleans.

FINANCE. The report of the city controller for 1902 gives the bonded debt of the city as \$17,286,490, and the valuation of real and personal property as \$147,201,984. The rate of taxation was 22 mills, consisting of: city expense tax, 10 mills; interest and redemption city bonds, 10 mills; special tax for water, sewerage, and drainage, 2 mills. To this tax of 22 mills should be added the State tax of 6 mills and the tax of 1 mill for the maintenance of levees, making the total rate 29 mills. There is also a poll tax of \$1, which is devoted to the support of public schools.

POPULATION. The census of 1900 gave New Orleans a population of 287,104, making it the twelfth largest city in the United States. This total included 30,325 persons of foreign birth and 77,714 of negro descent. The increase in population, according to the censuses of former years, is shown as follows: in 1870, 191,418; 1880, 216,090; 1890, 242,039.

HISTORY. New Orleans was laid out in 1718 by Jean Baptiste Le Moyne, Sieur de Bienville, then Governor of Louisiana, and it was named in honor of the Duke of Orleans, Regent of France. The centre of the new settlement was the old Place d'Armes, now called Jackson Square. In 1722, when New Orleans became the capital of the French territory in this vicinity,

its low, marshy site was visited by Père Charlevoix, who records in his journal that he found only a hundred barrack-like buildings, with a large wooden storehouse, and "two or three residences that would be no ornament to a village in France." With prophetic eye, however, he added: "I have a well-grounded hope that this wild and desert place, which the reeds and trees do yet almost wholly cover, will be one day—and perhaps that day is not far distant—an opulent city and the metropolis of a great and rich colony." In November, 1762, France ceded the whole of Louisiana to Spain, but the people in New Orleans, who first heard of the transaction in 1764, strenuously objected to the change and forcibly expelled the first Spanish Governor, who came in 1766. In 1769 Alexander O'Reilly (q.v.), who had just been appointed Governor of Louisiana, punished with unsparing severity those who had been prominent in the uprising. In the same year the census taken by Governor O'Reilly shows that the city possessed only 468 houses, with a population of 3191. Of these the free persons numbered 1901, the slaves 1230, and the domesticated Indians 60. During the rest of the Spanish period there was but slow growth, perhaps on account of the burdensome commercial restrictions of the Spanish régime. During the American Revolution New Orleans was the headquarters of the Spanish forces on the North American continent, and the place from which a number of expeditions were sent out by Governor Bernardo Galvez (q.v.) against the British. In 1800, by the secret Treaty of San Ildefonso (q.v.), Louisiana was retroceded to France, but the French Government did not take formal possession until November 30, 1803, just twenty days before American deputies came to take possession for the United States in pursuance of the Louisiana Purchase. By this year the population had increased to a little over 8000. In 1802 the products shipped from New Orleans consisted of flour, 50,000 pounds; tobacco, 2000 hogsheads; cotton, 34,000 bales. Some 5000 casks of rum were produced in the distilleries around the city, but the manufactures were mostly confined to cordage, hair-powder, vermicelli, and shot.

As for the government during the French and Spanish régime, the whole province was nominally in the hands of a Superior Council, which was a judicial body and theoretically a legislative one. In truth, however, this body, which was appointive, not elective, had very little power. All laws for Louisiana were made in France. There was no self-government either under the French or the Spanish. Under the Spanish a *Cabildo* (assembly) was substituted for the Superior Council. It was composed of six perpetual regidores, two ordinary alcaldes, an attorney-general syndic, and a clerk. The Governor presided. By a curious provision, the offices of regidor and clerk were obtained by purchase, and in the first instance at auction. The ordinary alcaldes and the attorney were elected annually by the *Cabildo*. The ordinary alcaldes were judges within the city for criminal and civil cases. The regidores were the standard-bearer, the high sheriff, the receiver of fines, etc. There was an appeal from this tribunal to the Captain-General of Cuba, and from him to the Royal Audience in Santo Domingo, and thence to the Council of the Indies in Madrid. As under the French, the laws were issued by the

Governor in the name of the King. Even the police regulations were issued by the same official.

In 1804, the year after the United States obtained possession, President Jefferson said that "the position of New Orleans certainly destines it to be the greatest city the world has ever seen;" but the growth for many years, though rapid, did not come up to the general expectations. In 1805 New Orleans was regularly incorporated, and the inhabitants elected a city council. This was the first occasion on which the right of public suffrage was ever exercised in Louisiana. Americans now crowded into the newly acquired city. In the winter of 1806-07 wild rumors were abroad that Burr intended to make New Orleans the capital of a new empire. The city was placed under martial law by General Wilkinson, and it was some time before the excitement subsided.

A great impetus to the prosperity of the city was given in 1812, when the first steamboat arrived from Pittsburg. The Mississippi was now to become a great highway of commerce, and New Orleans was to flourish accordingly. Growth was checked for a time by the war with Great Britain, which followed soon. When, however, General Jackson won his great victory at Chalmette in 1815 (see NEW ORLEANS, BATTLE OF), attention was speedily directed to the city that he had saved, and its population increased more rapidly than ever before. By 1830 it had risen to 46,000, and in 1840 to 102,000. The city was extended beyond its old boundaries, gas and other improvements were introduced, and a more cosmopolitan spirit began to appear. In 1837 the city became involved in the speculative mania of the day and suffered severely from the ensuing panic. Nothing, however, could permanently check the prosperity of New Orleans, not even the terrible ravages of the yellow fever, which in the decade before the Civil War were more fatal than ever before. In 1836 the Creoles were so little in accord with the Americans that a novel form of government was tried. The city was divided into three municipalities, each with a recorder and a council of aldermen. There were a mayor and a general council (embracing the councils of the different municipalities) to control the affairs of general interest, but each municipality could tax itself and manage its local affairs. This anomalous state of things continued until 1852. In 1849 the State capital was transferred to Baton Rouge, but later New Orleans was again for a time the capital (1868-80).

In the Civil War New Orleans was an important centre of Confederate military and commercial operations until captured by a Federal fleet under Admiral Farragut in April, 1862. (See FORT JACKSON.) Thereafter it proved an important strategic point for attacks upon other parts of the Confederacy. Under the administration of Gen. B. F. Butler (q.v.), which lasted from May to December, 1862, the city suffered the extreme rigor of martial law. Butler's successor, Gen. N. P. Banks, was far more conciliatory. During the period of reconstruction New Orleans was the headquarters of the politicians and of the 'carpetbaggers' who, with their freedmen allies, governed the State during this stormy period. In 1866 there was a serious riot at Mechanics' Institute (now Tulane Hall), in which a constitutional convention was broken up by

the Democrats and a number of persons killed. In 1874 the Republican Governor, William Pitt Kellogg, fearing an uprising of the people, denied the inhabitants the right to bear arms, and whenever arms were found on any person they were seized by the police. 'The White League,' a Democratic organization, determined to procure arms at all hazards. Arms were ordered by steamer from the North, and when the steamer arrived at the levee, the League, arming itself as best it could, marched down to the dock on Canal Street to receive them. Here a conflict was precipitated with the metropolitan police of the Governor. The police were scattered, and the artillery which they had placed upon the levee was turned against themselves. The White Leaguers lost sixteen men. Seventeen years later a monument was erected to their memory on the spot where they fell. While an appeal to the President once more restored the Governor to power, this affair of September 14, 1874, is generally regarded as the beginning of the end of reconstruction in Louisiana. In 1877 the United States troops were withdrawn, and with them the 'carpetbag' rule disappeared. With a free government restored, the city turned its attention to the development of its great opportunities, and steady progress has marked its subsequent history. In 1884 a Cotton Centennial Exposition was held here—the first bale of cotton exported from this country having been shipped from Charleston in 1784. In 1880 the capital of the State was removed from New Orleans. In 1891 nine Italians, members of the Mafia (q.v.), who had been arrested for the murder of the chief of police, David C. Hennessy, were lynched by a mob, after being acquitted by the courts. This gave rise to considerable controversy between the United States and the Italian governments.

NEW ORLEANS, BATTLE OF. The last battle of the War of 1812 between the United States and Great Britain, fought at Chalmette, near New Orleans, La., January 8, 1815. On December 10, 1814, a British fleet of more than fifty sail with about 7000 troops on board arrived off the eastern coast of Louisiana and came to anchor near the entrance to Lake Borgne. Twelve days later a division of the troops, by the aid of treacherous Spanish fishermen, made its way up Bayou Bienvenue, and on the afternoon of the 23d reached the right bank of the Mississippi, some miles below New Orleans. A few hours later the Americans, who for some weeks had, under the leadership of Major-Gen. Andrew Jackson, been preparing to resist the invasion, made a night attack upon the division and inflicted considerable loss, but did not succeed in overwhelming it. Next morning Gen-

eral Jackson fell back behind an old disused mill-race that stretched across the strip of solid ground from the river to a cypress swamp, and there threw up a breastwork. This breastwork was composed chiefly of earth, and not of cotton bales, as was once believed; as a matter of fact, 277 bales were originally used in the embrasures of some of the batteries and in building a magazine. On New Year's Day Major-Gen. Sir Edward Pakenham, who had now arrived with reinforcements and taken command of the English, attempted to batter down the American lines by a cannonade; but this attempt failed, and he then decided to try an assault. The plan he adopted was for Lieutenant-Colonel Thornton to cross the river and storm an American battery on the right bank; while on the left bank two columns were to assault the American main position. The assault was made on the morning of January 8, 1815. On the left bank the British attacked with spirit, but were met with such a heavy cannonade and with such a storm of bullets from the rifles of the American troops, mainly backwoodsmen from Tennessee and Kentucky, that in less than half an hour about 2500 men, including Major-Generals Pakenham, Gibbs, and Keane, were shot down, and the assault failed. The American loss in this main engagement was but eight killed and thirteen wounded. On the right bank Thornton was successful, but, owing to the defeat of the main army, was unable to follow up his advantage. Ten days later the British retreated to their ships. Although the battle was fought after the Treaty of Ghent (q.v.) had been signed, it had results of importance. It was, says the historian Schouler, the only battle of the war that made an impression on Europe, and it served also to help quicken the yet feeble sense of American nationality. By giving a sunset glow of success to an otherwise somewhat inglorious war, it greatly strengthened the position of the Administration and hastened the "death-bed scene of the Federalist Party." Most important of all, it made General Jackson, who had displayed military talents of a high order, the idol of the American people and was an important factor in causing his subsequent elevation to the Presidency. Consult: Latour, *Historical Memoir of the War in West Florida and Louisiana in 1814-15* (Philadelphia, 1816); Walker, *Jackson and New Orleans* (New York, 1856); Parton, *Life of Andrew Jackson* (ib., 1860); James, *Military Occurrences* (London, 1818); Cook, *Narrative of Events in the South of France and of the Attack on New Orleans in 1814-15* (ib., 1834); and Gleig, *Campaigns of the British Army at Washington and New Orleans* (Am. ed., Philadelphia, 1821 and 1833).

NEW PHILADELPHIA. A city and the county-seat of Tuscarawas County, Ohio, 100 miles south of Cleveland; on the Tuscarawas River, the Ohio Canal, and the Cleveland, Lorain and Wheeling and the Pennsylvania railroads (Map: Ohio, H 4). There are mining interests, and manufactures of steel, canned goods, roofing tile, woolen goods, carriages, flour, brooms, and pressed, stamped, and enameled goods. The principal attractions of the city are Springer's Park and Shorenbraun Springs. Settled in 1805, New Philadelphia was first incorporated three years later. The government is vested in a mayor, who holds office for two years, and a unicameral coun-

cil. Town meetings are held when required by matters of general interest. Population, in 1890, 4456; in 1900, 6213.

NEW PHILIPPINES. Another name for the Caroline Islands (q.v.).

NEW PLYMOUTH. The capital and seaport of Taranaki County, North Island, New Zealand, on the west coast, 160 miles southwest of Auckland (Map: New Zealand, D 3). It has an extensive harbor and is a terminal of railway lines to Wellington and Napier. Population, in 1901, 4405. Consult Wells, *History of Taranaki* (New Plymouth, 1878).

NEW POMERANIA (Ger. *Neu Pommern*), formerly **NEW BRITAIN**. The largest island of the Bismarck Archipelago, in Melanesia. It lies 50 miles from the northeast coast of New Guinea, and stretches east and northward in a narrow crescent, 300 miles long and 90 miles in greatest breadth, but in several places contracted to a strip only a few miles wide (Map: Australasia, H 3). Its area is about 9500 square miles. The interior is still but little known; it is mountainous, with several active or half extinct volcanoes in the northeastern part, one of which has an altitude of 3600 feet, while in the western extremity Hunstein Mountain reaches a height of 6000 feet. The rainfall on the island is abundant, and the vegetation is luxuriant, the interior being covered with immense forests reaching to the summits of the mountains, while the coastal districts are very fertile. The natives, whose numbers are unknown, are Melanesian savages. The European inhabitants number less than 100, and reside in a missionary and a trading station on the northeastern coast. For statistics and history, see **BISMARCK ARCHIPELAGO**.

NEWPORT. A market-town and river-port in Monmouthshire, England, 20 miles southwest of Monmouth, on the Usk, four miles from the Bristol Channel, and 12 miles northeast of Cardiff (Map: England, C 5). It has brass and iron foundries, breweries and pottery works, and manufactures of telegraph and railway supplies and wagons, india-rubber, and gutta percha. Iron ships are also built here. The dock accommodation covers 80 acres, and it has an important shipping trade in coal and iron. The town has fine buildings. Prominent among them are the town hall and Saint Woollos, one of the most curious churches in England. The municipality owns much real estate, the water-works, electric lighting plant, tramways, baths, slaughter houses, markets, cemeteries, provides technical instruction and cottage allotments, and maintains a free library, museum, parks, isolation hospital, and a fire brigade. The town is first mentioned at the beginning of the tenth century, and received its first charter from Edward II. The towers and the central mass remain of the castle, built about 1130 by Robert, Earl of Gloucester. Population, in 1891, 54,707; in 1901, 67,290.

NEWPORT. The chief town of the Isle of Wight, England, situated near the centre of the island, on the Medina (Map: England, E 6). It is the commercial centre of supply for the island, has breweries, cement factories, and trade in malt, wheat, and flour. Saint Thomas's Church, founded in 1854, is a handsome edifice, and contains a monument erected by Queen Victoria to

the Princess Elizabeth, daughter of Charles I. Its grammar school, founded in 1612, was the scene of negotiations between Charles I. and the Parliament. The town, already favored with charters and privileges, was incorporated by James I. It owns the water supply and markets. Population, in 1891, 10,216; in 1901, 10,911.

NEWPORT. A city in Campbell County, Ky., at the junction of the Ohio and Licking rivers, which separate it from Cincinnati, Ohio, and Covington, Ky.; and on the Chesapeake and Ohio and the Louisville and Nashville railroads (Map: Kentucky, G 1). There are bridges across both rivers, and the cities of Cincinnati, Newport, and Covington are connected by electric railroad, the Kentucky cities being popular as places of residence for Cincinnati business men. A few miles distant, in the hills back of Newport, is the United States military post, Fort Thomas. Newport has a city park, and a public library, the library building ranking with other prominent edifices of the city—the court house, municipal building, and in addition the post office, Masonic Temple, and Newport and German national banks. The chief manufactured products are watch-cases, cast iron pipes, sheet iron, rails, carriage supplies, and cigar-box material. Settled about 1791, Newport was incorporated in 1795 as a town, and in 1850 received a city charter. The government, under a charter of 1894, is administered by a bicameral council and by a mayor, elected every four years. The executive appoints fire, police, and water-works commissioners, and, with the consent of the board of aldermen, the city auditor and superintendent of public works. The council is selected from the wards, but elected at large, and appoints bridge commissioners. Other municipal officials and the board of education are chosen by popular vote. Members of the municipal council and board of education hold office for two years, all other officers for four years. The city owns and operates the water-works. Population, in 1890, 24,918; in 1900, 28,301.

NEWPORT. A town and the county-seat of Sullivan County, N. H., 42 miles west-north-west of Concord; on the Sugar River, and on the Boston and Maine Railroad (Map: New Hampshire, F 8). The beautiful surroundings of the town make it of considerable importance as a summer resort. There is a public library of 7000 volumes. Newport has extensive manufactures of flannels, cotton underwear, shoes, agricultural implements, and lumber products. The water-works are owned by the municipality. Population, in 1890, 2623; in 1900, 3126. Consult Wheeler, *The History of Newport, N. H.* (Concord, 1879).

NEWPORT. A port of entry and the county-seat of Newport County, R. I., and until 1900 one of the capitals of the State, 17 miles south by west of Fall River, Mass., and 30 miles south of Providence; on Rhode Island in Narragansett Bay, and on the New York, New Haven and Hartford Railroad (Map: Rhode Island, C 4). It has also regular steamboat communication with New York, Providence, and other cities, with increased transportation facilities in summer. Newport is an important United States naval station, but has far greater reputation as a summer resort. Its splendid harbor, defended by Fort Adams and Fort Greble, admits the

largest vessels and usually presents a scene of great animation, while its varied scenery, its points of historic interest, equable climate, and excellent facilities for boating, bathing, and driving have combined to establish Newport as the most exclusive and fashionable watering place in the United States. The narrow streets and quaint houses of the old town adjoin the harbor; the 'society' quarters with their new and more elaborate architecture reach over to the ocean side of the island. Among the popular objects of interest are First or Easton's Beach, and Bailey's Beach, the bathing resorts; Cliff Walk and the ten-mile Ocean Drive; the Hanging Rocks; the rocky fissure, fifty feet deep, locally known as Purgatory; and Spouting Rock, where the water, when disturbed by a storm, is forced through an opening in the rock, sometimes to a height of fifty feet. On Coaster Harbor Island is the United States Naval Training Station and War College, and on Goat Island, a United States torpedo station. The naval hospital on the mainland was opened in 1897. On Canonicut Island, opposite Newport, is the town of Jamestown, which has an individual reputation as a summer resort. There are numerous public fountains, statues and monuments, and public parks, notably Touro and Morton parks; several libraries—Redwood and People's together containing more than 60,000 volumes, and the Newport Historical Society, which has an interesting collection of relics; Saint George's and Cloyne House schools. Other attractive features of Newport are its historic buildings: the State House, erected in 1742; the old city hall, in 1763; the synagogue (1763), said to be the oldest in the United States; Redwood Library, in 1748; Trinity Church (Protestant Episcopal), in 1725; the Sayer House, headquarters of the British army in 1777; and the Vernon House, Rochambeau's headquarters in 1780. In commerce and industry Newport is comparatively of small importance; there is, however, a large trade in fish. The government is administered under a charter of 1853, which provides for a mayor, annually elected, and a bicameral city council that has important elective powers in municipal offices. Population, in 1890, 19,457; in 1900, 22,034.

Newport was settled in 1639 by William Codrington and a few followers, who in the previous year had been driven from Boston for sympathizing with Antinomianism. In 1647 it was united for governmental purposes with Providence, Portsmouth, and Warwick, under the charter of 1643, but there was much dissatisfaction until a second charter was issued in 1663. Here, in 1640, one of the first public schools in America was begun; and here, in 1656, came some of the first Quakers who emigrated to this country. In 1729 Bishop Berkeley came to Newport, and remained in the vicinity for nearly three years, the house, Whitehall, occupied by him, being still in fairly good condition. Here he wrote much of his *Alciphron* and his ode on Western progress. In the latter half of the eighteenth century Newport was a great trading centre, and by 1769 its commerce exceeded that of New York. On May 17, 1769, the British sloop *Liberty*, engaged in enforcing the smuggling laws, was destroyed here—this being one of the earliest acts of American resistance to England. From December, 1776, to November, 1779, Newport was occupied by British troops, by whom 480 of its houses were de-

stroyed and its shipping so crippled that the town never recovered its commercial prestige. Rochambeau with his French troops was stationed here in 1780. First incorporated in 1784, Newport surrendered its charter two years later, and was not re-incorporated until 1853. It was the birthplace of Commodore M. C. Perry and of William Ellery Channing. In Touro Park stands the famous 'Old Stone Mill,' formerly supposed to have been built by the Northmen in the eleventh century, but now very generally believed to have been erected by Gov. Benedict Arnold about 1675. The *Newport Mercury*, founded in 1758 by James Franklin, is still published. Consult: Greene, *The Providence Plantation* (Providence, 1886); "Newport in the Revolution," an article in the *New England Magazine*, n. s., vol. ii. (Boston, 1890); Brooks, *The Controversy Touching the Stone Mill* (Newport, 1851).

NEWPORT. A village and the county-seat of Orleans County, Vt., 49 miles north by east of Montpelier; on Lake Memphremagog, and on the Canadian Pacific and the Boston and Maine railroads (Map: Vermont, F 2). It has the Goodrich Memorial Library (public), with 6500 volumes, and is a well-known summer resort. The village is surrounded by a farming region. There are some manufactures. Population, in 1890, 1730; in 1900, 1874.

NEWPORT, CHRISTOPHER (c.1565-1617). An English navigator. In 1591 he sailed from London as captain of the *Golden Dragon* with three other ships, on an expedition to the West Indies. After sacking four Spanish towns and capturing and sinking twenty Spanish merchantmen, the expedition turned back across the Atlantic laden with spoil. At Flores they joined Sir John Burgh and took part with him in the capture of the *Madre de Dios*, August 3, 1592. In 1606 Newport commanded the fleet of three ships which conveyed John Smith and his fellow colonists to Virginia. He spent some time in Virginia, and took part in an exploring expedition up the James River with Smith. In 1607-08 he made another voyage to Virginia, and in 1609 commanded the first expedition sent out under the second charter, which conveyed Sir Thomas Gates and Lord Somers to Virginia. Newport's ship, the *Sea Venture*, was cast ashore on the Bermudas, whence the colonists proceeded to Virginia in two small pinnaces, which they constructed from the wrecked ship. In 1611 he made a last voyage to Virginia. In the year following he entered the service of the East India Company. Between 1613 and 1617 he made four voyages to India for the company, finally dying at Bantam of a fever. An account of his voyages to America, entitled *Newport's Discoveries in Virginia*, and purporting to have been written by "a gentleman of the colony," was published in the *Archæologia Americana*, vol. iv. (Boston, 1860).

NEWPORT, GEORGE (1803-54). An English naturalist and physician, born at Canterbury, and educated at London University and at the College of Surgeons. He was one of the most skilled anatomists of his time, and his researches on the structure of insects and other arthropods are very important. His publications include: *On the Respiration of Insects* (1836); article on "Insecta" in Todd's *Cyclopedia of Anatomy and Physiology* (1839); *On the Use of Antennæ of Insects*

(1840); *List of Specimens of Myriopoda in the British Museum* (1844); *Monograph of the Class Myriopoda, Order Chilopoda* (1845); and *On the Impregnation of the Ovum in the Amphibia* (1851).

NEWPORT NEWS. A city and port of entry in Warwick County, Va., 12 miles north by west of Norfolk, and 75 miles southeast of Richmond; on the James River and Hampton Roads, and the terminus of the Chesapeake and Ohio Railroad (Map: Virginia, H 5). It has also several coastwise and foreign steamship lines. A fine harbor and excellent shipping facilities have made Newport News the centre of large commercial interests, its foreign trade in 1901 being valued at \$36,658,000, including exports to the amount of \$32,568,000. Its industrial interests, too, are well developed. There is a shipyard employing 6000 men, with two dry docks, 600 and 900 feet in length; also grain elevators, lumber mills, iron works, and coal wharves. Casino Park, in the heart of the city and on the James River, is a popular place of resort. The government, under the original charter of incorporation, is vested in a mayor, elected every two years, and a city council, which confirms the executive's appointment of the police commissioners and elects all other municipal officials, excepting those chosen by the people. Settled in 1882, Newport News was incorporated first in 1896. Its growth during the decade 1890-1900 was exceedingly rapid, a population in 1890 of 4449 having increased to 19,635 in 1900.

NEW PROVIDENCE. The most important, although one of the smallest, of the Bahama Islands. It is situated between Eleuthera and Andros islands, 170 miles from the southeast coast of Florida (Map: West Indies, J 2), and has an area of 85 square miles. In physical features it resembles the other Bahamas (q.v.), but it alone has a good harbor, and on it is the town of Nassau (q.v.), the capital of the islands. The first English settlement in the Bahamas was founded on New Providence in 1629.

NEW RED SANDSTONE. A large series of reddish-colored loams, shales, and sandstones, occurring between the Carboniferous and the Middle Triassic formations, were grouped together under this name, in contradistinction to the Old Red Sandstone group, which lies below the coal measures, and has a similar mineral structure. It has been found, however, that two very distinct periods were included under this name; and the contained fossils of each group were found to be so remarkably different that the one period was referred to the Paleozoic system, under the name of Permian (q.v.), while the other was determined to belong to the Triassic system (q.v.). The name is no longer used in the United States.

NEW RIVER. A river of West Virginia. See GREAT KANAWHA.

NEW ROCHELLE, rô-shêl'. A city in Westchester County, N. Y., 16½ miles from the Grand Central Station, New York City; on an arm of Long Island Sound, and on the New York, New Haven and Hartford Railroad (Map: New York, G 5). It is mainly a residential suburb of New York, and has some reputation as a summer resort. There are many handsome residences, and several spacious colonial mansions

dating from the Dutch and English periods. An Ursuline seminary now occupies 'Leland Castle,' which is known for its fine interior decorations. The city has a public library with over 8500 volumes. New Rochelle was settled in 1687 by Huguenots, some of whom were natives of La Rochelle. It was the home for several years of Thomas Paine, to whose memory a monument has been erected. Population, in 1890, 9057; in 1900, 14,720.

NEW ROSS. A town lying mainly in County Wexford and partly in Kilkenny, Ireland, on the Barrow River, 29 miles by rail northwest of Wexford (Map: Ireland, E 4). An iron bridge with a draw connects the suburb of Rosbercon on the Kilkenny side. Ships of 600 tons can unload at its quays at all stages of the tide. Its favorable situation is deserving of much greater industrial prosperity than the town possesses. There is, however, some trade in agricultural products, and there are salmon fisheries. Although believed to date from the sixth century, its history begins with the erection of the old monastery in the thirteenth century. Cromwell captured the town in 1649 and destroyed its walls and fortresses, of which there are fragmentary remains. Population, in 1901, 5867.

NEWRY, nŭ'ri. A seaport and market-town, partly in County Armagh, but principally in County Down, Ulster, Ireland, 63 miles north of Dublin and 38 miles south-southwest of Belfast (Map: Ireland, E 2). It is traversed by the Newry River, which is crossed by five bridges and falls into Carlingford Lough, and by a canal, by which the navigation is prolonged to Lough Neagh, a distance of 32 miles. Newry is also connected by the Newry Canal with Victoria Lock. The town is handsomely and compactly built. The quays are lined with spacious warehouses, and there are several tanyards, coach and car manufactories, iron foundries, grain, flour, and spinning mills. Extensive water-works have been constructed. Steam vessels ply to Liverpool and Glasgow from Warrenpoint, a port five miles distant on Carlingford Lough. The Newry and Greenore Railway connects the Newry and Armagh line with the deep water harbor of Greenore. The town is nearly coeval with the English invasion, having grown up around a monastery founded in 1183 and a castle subsequently erected by De Courcey. This castle was the scene of several struggles, and in most of the civil wars of Ulster Newry suffered severely. It was incorporated as a borough by James I., and sent two members to Parliament. The corporation was abolished by the Irish Municipal Reform Act and the affairs of the town are now administered by twenty-one commissioners. Population, in 1891, 12,961; in 1901, 12,587.

NEW SALLEE, sa-la'. A seaport of Morocco. See **RABAT**.

NEW SCHOOL PRESBYTERIANS. See **PRESBYTERIANISM**.

NEW SIBERIA, or LIAKHOV, ISLANDS. A group of islands in the Arctic Ocean, situated north of Eastern Siberia, between latitudes 73° 9' and 77° 30' N., and between longitudes 136° 16' and 159° 6' E. (Map: Asia, P 1). The principal islands of the group are Kotelnoi, New Siberia, and Liakhov, with areas of from 1000 to 3000

square miles, the combined area of the whole group being 9500 square miles. The islands consist mainly of rocky, ice-bound cliffs, and are quite treeless and uninhabited, save for the temporary sojourn of hunters. Game, especially fur-bearing animals, is abundant. The islands are noted for the great quantities of bones of extinct animals found there, notably those of the mammoth. The group was discovered in 1770 by the Russian merchant Liakhoff, and the islands have since been visited by several other explorers.

NEW SOUTH SHETLAND ISLANDS. See **SOUTH SHETLAND ISLANDS**.

NEW SOUTH WALES. A State of Australia, situated in the southeastern part of the continent, and bounded on the north by Queensland, on the east by the Pacific Ocean, on the south by Victoria, and on the west by South Australia (Map: Australia, H 5). Its area, 310,367 square miles, is more than five times that of England and Wales, much larger than that of any of the United States, and more than twice that of the State of California.

PHYSICAL FEATURES. The Great Dividing Range runs along the coast in an irregular system of broken minor ranges, whose main axis extends about 100 miles inland. It is known as the Australian Alps in the south, the Blue Mountains near the centre, and the New England Range in the north. These mountains are broken by deep ravines and cañons. The Blue Mountains are especially rugged and abrupt and long formed an impassable barrier. The highest point is Mount Kosciusko, near the southern boundary, with an altitude of 7308 feet. The mountains are flanked on the west by a broad, undulating plateau, which sinks gradually toward the Great Plains of the west, but rises again in the northwestern corner of the State to a height of 2000 feet in the Stanley and Grey Ranges. The coast is bold and rocky, and indented by a number of small inlets, among which Port Jackson, the harbor of Sydney, forms one of the finest harbors in the world. The rivers on the eastern slope of the Dividing Range are small, the largest being the Hawkesbury, with a length of 330 miles. The Murray River forms the southern boundary of the State, and its two great tributaries, the Darling and the Lachlan, course through the western plains. Several streams flow from the northwestern mountains toward the Darling, but are lost in the arid plains before they reach it. Nearly all the rivers of the plains dry up or are reduced to strings of ponds during the dry season, while in the wet season large areas of the plains are inundated.

CLIMATE. The climate is in general mild, becoming subtropical toward the north. The mean temperature on the coast is 76°, with an average maximum of 100° for January, and 55° for July. On the interior plains the range is much greater. Here the temperature may reach 130°, and there are hot dust winds. The rainfall is greatest in the southeastern extremity, where it registers 73 inches, the average on the coast being 50 inches. On the interior plains it is generally less than 20 inches, falling below 10 inches in the northwest. The uplands and the eastern portion of the great plains are covered with open forests of eucalyptus trees. Denser forests grow in the valleys of the very fertile coastal districts. The arid western plains are covered only with stunted scrub.

The flora and fauna partake of the general character of Eastern Australia. See AUSTRALIA.

GEOLOGY AND MINERALS. The mountain and plateau regions consist mainly of Paleozoic rocks, Silurian in the south, Carboniferous in the central portion, and Devonian in the north, while the northeastern and southeastern coast districts are overlaid with lower Mesozoic strata. There are considerable outcrops of granites and metamorphic rocks in the higher regions, with dikes of volcanic trap, basalt, and greenstone. The great plains are formed by horizontal strata of Cretaceous and Tertiary sandstone, sands, and gravel. Rich and extensive coal beds cover large areas in the State. Gold exists in quartz veins in the Silurian rocks, and silver, tin, copper, iron, and precious stones are also found.

MINING. Mining rivals grazing in importance, and has been gaining, while the latter has declined. The first Australian gold was mined in New South Wales, and the total value of this product mined to date exceeds that of any other mineral in the State. The annual output in recent years, however, has been exceeded in value by silver and silver-lead and by coal, although nearly half the men employed in the mining industry, or 19,350 (1899), are engaged in gold-mining. The average yield of gold between 1890 and 1900 was twice that of the preceding decade. The output in 1900 was valued at £1,194,521. The production of silver and silver-lead ore was insignificant prior to 1884, when it increased rapidly until 1891, the record for that year not having been subsequently surpassed. In 1900 the value was £2,604,117. The production of coal in 1900 was valued at £1,668,911, an amount exceeded in only one previous year. The decline in copper production from 1890 to 1895 was wholly regained in the latter part of the decade, the output in 1900 being valued at £425,301. The production of tin in 1900 was valued at £142,724—the highest figure attained since 1892. Several kinds of iron ore are mined, and a number of other minerals are obtained in small quantities.

AGRICULTURE. Agriculture is increasing in importance, but is still subsidiary to stock-raising. The soil is generally of great fertility, but the scantiness and uncertainty of the rainfall prevent it from being tilled in the great regions west of the mountain ranges. The unfavorable climatic conditions are most severe on the far western plains. In the coast district, and on the tablelands and the western slope of the tablelands, a considerable area is cultivated. The climate on the coast admits of the growth of a wide range of products, both temperate and tropical, being not unlike that of California in this respect. Although the possibilities of fruit culture are great, the industry in general has not made any considerable progress. Oranges and grapes, however, receive no little attention. The remoteness from the world's markets has tended to limit the production of all agricultural products. The total area under tillage, excluding lands grassed, increased almost steadily from 629,180 acres in 1881 to 852,704 acres in 1891, and 2,446,767 acres in 1901. The principal crop and the one that represents the largest percentage of increase is wheat, to which 1,530,609 acres were devoted in the latter year. The other principal crops, with their acreages, were: hay, 66,236; corn, 206,051;

oats, 29,383; sugar-cane, 22,114; and grapevines, 8441.

STOCK-RAISING. The extensive area of grassed lands and the mildness of the winters are greatly favorable to grazing, which is the most characteristic industry of the State. The greatest attention is paid to sheep, about four-sevenths of the sheep of Australia being in New South Wales. The maximum number, nearly 62,000,000, was reached in 1891. This was reduced in 1900 to about 40,000,000. The decrease was attributed to the droughts, which were very severe during this period. The insufficient water supply is a serious disadvantage to the industry. The number of cattle in 1900 was 1,983,116; horses, 481,417; and swine, 256,577. Much of the pastoral land is owned by the State and leased to the stockmen.

MANUFACTURES. Prior to the establishment of the federation of Australian States, New South Wales differed from the other Australian colonies in that it did not have a tariff for the protection of its manufactures. However, the majority of the 60,779 hands employed in these industries in 1900 were engaged in domestic manufactures which were not subject to foreign competition—the preparation of food, drink, etc. The manufactures centre largely about Sydney.

TRANSPORTATION AND COMMERCE. A railroad traverses the eastern part of the State from north to south and a branch line penetrates northwestward to the Darling River. In 1900 nearly the whole of the 2896 miles of line in operation were in the hands of the Government. The net earnings are almost equal to the annual cost of the debt incurred in the construction. The State has a large foreign trade. It is almost evenly divided between imports and exports. The value of the total trade in 1900 was £55,725,587, being in excess of that reached in any previous year. Considerably over three-fifths of the imports were for home consumption, and a like amount of the exports were of domestic origin. Wool is by far the greatest item of the State's exports. It is followed in order of importance by silver, silver-lead, and ore, coal, copper, tallow, and tin. The great bulk of the commerce is with the United Kingdom, but the trade with the United States, France, Germany, and Belgium is rapidly growing. The largest export to the United States is wool and the State's imports from the United States are mainly manufactured products. In 1900, 3406 vessels, with 3,920,801 tonnage, cleared the ports of New South Wales.

GOVERNMENT AND FINANCE. New South Wales is governed by a Governor, appointed by the Crown, a responsible Ministry, a Legislative Council appointed by the Crown for life, and a Legislative Assembly elected by the resident voters of the colony. Down to 1893 there was a property qualification by law. In that year it was abolished. The suffrage is exercised by every male subject twenty-one years of age who has lived three years in the colony and three months in his electoral district. New South Wales has six representatives in the Australian Senate and 26 in the Australian House of Representatives. In the fiscal year ending in 1900, out of a total net revenue of £9,970,677, the Government received £2,618,066 from taxation, £2,116,076 from land-sales and leases, and £4,992,521 from service—railroads, etc. The greater part of the tax receipts are from import and excise duties.

There is an income tax. The bulk of the income is expended upon the maintenance of the public works and public service and the charges of the public debt. For a further discussion of New South Wales and its government, particularly in comparison with other Australian States, see AUSTRALIAN FEDERATION.

POPULATION. In 1901 there was a population of 1,359,133—males, 712,456; females, 646,677—or 4.38 per square mile. In 1860 the population was only 348,546, the gain since that time having been much greater than for any other Australian State. At the end of the century the State had passed Victoria, and had become the most populous Australian State. From 1881 to 1891 there were 164,205 more arrivals than departures, but the excess had fallen in the following decade to only 16,167. The Chinese number 10,974, and the aborigines and half castes 7434. In 1901 Sydney, the capital, had a population of 111,801, and with suburbs, 488,968; Newcastle, 14,250; and Broken Hill, 27,518.

RELIGION. About 45 per cent. of the church population are adherents of the Church of England and about 25 per cent. Roman Catholic. The Presbyterians and the Wesleyans and other Methodists are the strongest of the smaller denominations. State aid to religion is abolished.

EDUCATION. There is a compulsory school attendance law for children between the ages of six and fourteen. Small fees are charged those able to pay. In 1900 there were 238,382 scholars enrolled in the State schools and colleges, and 60,327 in private institutions. Over half of the latter number were in Catholic schools. In 1900 the gross State expenditure for schools was £780,216, and the receipts from school fees amounted to £82,494. The State maintains a university at Sydney.

HISTORY. See AUSTRALIA and article on AUSTRALIAN FEDERATION.

NEWSPAPER. A public print issued at periodical intervals, sold at a fixed price per copy, and for a definite period to regular readers known as subscribers, and giving three classes of information: (a) relating to events, or 'news'; (b) opinions, or 'editorials'; and (c) wares on sale, or 'advertisements.' A newspaper is distinguished on one side from the magazine or monthly by the absence in the latter of any concerted effort to present a new record of recent current events. It is separated from the pamphlet or newsletter by its periodic appearance

and stated publication. Special postal privileges in the United States—a rate of one cent a pound, paid in bulk, or one-eighth that for books, one-sixteenth that for merchandise, and one-thirty-second that for letters—and in other countries press laws have led to many judicial and administrative decisions which unite in defining a periodical as earmarked by recurrent publication and a subscription list made in good faith, and the newspaper as published at least once a week. The term newspaper, while legally applied to a weekly, usually indicates a daily publication issued either early in the morning or in the afternoon. When the size of a sheet of paper and of a press bed-plate was limited by conditions of manufacture to the sweep of a man's arm in paper-making or in working a hand-press, the newspaper consisted of one large folio sheet doubled, giving four pages. When the changes in paper manufacture at the close of the eighteenth century and in the bed-plate of a press at the beginning of the nineteenth century through the application of power to printing enlarged the sheets and altered their limit, the newspaper began to be folded for the weekly to a square octavo, and enlarged for the daily to a large 'blanket' sheet. The introduction of the cylinder press after the middle of the nineteenth century and the manufacture of paper from wood-pulp of any size desired, fed to a press from a spool, changed the daily newspaper to its present form, containing a variable number of pages—from 4 pages to above 100, but usually 12 to 16 pages in English-speaking cities of over 500,000; 8 to 12 in cities of 250,000; and 4 in cities of less than 20,000; in Europe, usually from 4 to 8 in cities of 100,000; and 4 in smaller places, printed on both sides at a single impression. Newspapers, by periodic appearance, divide sharply into weekly (usually devoted to a special field, social, political, literary, the general weekly being the exception) and daily. The special daily is the exception, the world's four largest capitals and some American lesser cities having dailies devoted exclusively to the stock market or sports. American universities of over 1000 students usually support a daily. The city daily necessarily covers four fields: (a) the events of the place in which it is published; (b) events without; (c) opinion, usually given on a separate page, known as the editorial page; (d) the quotation of stock, cereal, and other exchanges, and advertisements. To these are added combined criticism and record, in special articles and correspondence on special fields, as politics, sports, theatre, letters, education, etc. Usually the earlier pages of a newspaper open with news from without and pass to local news. The markets and the larger share of the advertisements are usually on later pages. The editorial page, or expression of opinion, is generally between. When the two sides of a 4 or 8-page sheet had to be printed successively (until the invention of the web-perfecting press), this division was necessary. Still preserved from custom, an arrangement is now growing up in the United States in which important news, likely to attract buyers, gravitates to the front, and other fields to the rear pages, an arrangement long prevalent in the French boulevard press. As politics is the one subject of universal interest for men, newspapers in all countries tend to ally themselves with one of two political parties, where

a bi-partisan organization for the control of an elective government exists. Where, as in European countries, parties are replaced by groups, each has its newspaper. In both cases some papers are known as independent. In all, newspapers exert a double influence. Those who read are directly affected by what is printed as with any printed utterance, but the periodic issue and the consequent array of subscribers or regular readers give newspapers in politics and in other fields a representative character, their influence depending on the fact that what is said expresses the opinion of a great multitude of readers. The skillful editor succeeds in combining leadership in new exigencies and problems with the capacity of expressing the opinion or sentiment that great masses of his readers will feel as new events call for the application of old principles.

Two empires, the Roman and the Chinese, had from an early period issues similar to the newspaper. The *Acta Diurna* (Daily Occurrences) of ancient Rome contained reports of great military achievements and of interesting events at Rome, as reports of elections, trials, games, fires, sacrifices, and miracles. They were written out by officers called *actuarii*, and deposited among other public archives. Copies were sometimes posted in public places, and sent at irregular intervals to the generals in the provinces, that the army might be informed of what was taking place in other parts of the Empire. They continued to be issued until the downfall of the Western Empire.

The Peking Gazette, *Tching-pao*, "News of the Capital," has appeared since 713 to 741 in the T'ang dynasty at the Chinese capital, and has for many centuries been issued daily. It is printed in a Government edition sent to officials, and in a popular edition with regular subscribers, reprints also appearing in the provinces, both having been furnished from an early period. It consists exclusively of Imperial rescripts, council decrees, and official news. It is undoubtedly the earliest daily in existence.

Neither of these official issues has any relation with the modern newspaper by example, still less by direct descent. The newspaper, as known today, is of composite origin. In the sixteenth century it was represented by news sheets, single folio pages sold by peddlers and criers giving news of a single occurrence. The first dated examples of these appeared in 1498, and some 800 examples are preserved which appeared before 1510.

These small news sheets appeared in Augsburg, Vienna, Ratisbon, Nuremberg, Antwerp, and many other places, generally in the form of letters. The extant numbers contain, among other matters, accounts of the discovery of America, of the conquests of the Turks, of the French and Austrian War in Italy, with such local occurrences as executions, inundations, earthquakes, burnings of witches, and child-murders, supposed to be committed by the Jews. Of equal interest are the official *Notizie Scritte*, established by the Venetian Government in 1566, containing accounts of the wars carried on by the Republic, and of other events of general interest. At first they were not printed, but might be read in various public places on payment of a small coin, called a *gazetta*, whence the name *Gazette* (q.v.).

These represented the issue of floating rumor or a private letter by the presses of the day. As the press ceased to be a personal, and became a

business venture, and regular communication was established by various posts over European countries, these broad sheets of news and opinion developed into the journal regularly issued—of which the *Frankfurter Journal*, published by Egenolph Emmel in 1615, suspended in 1902, was the first—the 'news-letter,' furnished to the correspondent by men usually in official life at the different capitals, the prototype of the later despatch and correspondent, and the pamphlet, discussing opinion, which began treating public affairs all over Europe from the standpoint of the editorial in the seventeenth century. By the opening of the eighteenth century these became united in daily journals which combined the report of the broad sheet, the correspondence of the news-letter, and the polemics of the pamphlet, adding the advertisement in 1648, and the regular market report at the close of the eighteenth century.

ENGLAND. The founder of the English press was a London printer named Nathaniel Butter (died 1664). As early as 1605 he was issuing news pamphlets; and in 1622 he began *The News of the Present Week*, which under varying titles was continued till 1639. His slips were mostly compiled from similar foreign sheets, and contained very little home news. But they bore the distinguishing mark of the newspaper: they were published regularly. During the Civil Wars there circulated a large number of sheets, with such names as *England's Memorable Accidents*; *The Kingdom's Intelligence*; *Mercurius Aulicus*; *Mercurius Politicus*; *The Scots Intelligence*; *The Parliament's Scout*; *The Scots Dove*; *The Parliament Kite*; *The Secret Owl*; *Mercurius Mastix*; *Mercurius Democritus*; and *Mercurius Acheronticus, or News from Hell*. The arrangement of the news was poor in the extreme, and the comment most virulent. The first English newspaper which aimed at general information was the *Public Intelligence*, established by Sir Roger L'Estrange in 1663; it was dropped soon after the appearance of the *London Gazette*, the first number of which was published at Oxford, November 7, 1665. A second paper, called the *Observer* was started by L'Estrange in 1681. In the reign of Charles II. the development of the newspaper was checked by the rigid enforcement of the licensing act of 1662. Under that régime nothing but an official organ could long survive. The repeal of the licensing act in 1695 opened a new era in English journalism. Newspapers at once sprang up in London and in other cities. Besides news-letters, flying posts, and mercuries, appeared the *Edinburgh Gazette*, a semi-weekly (1699); the *Daily Courant*, the first English daily (1702); the *Review*, established by Defoe for the discussion of political questions (1703); and the *Orange Postman*, the first penny paper (1709).

Though the licensing act was of the past, the newspaper writer was held to strict account for what he printed. During the reign of George III. prosecutions were especially common. The usual result was to give increased currency to the doctrines assailed, and to confer a fictitious importance on traders in politics, by whom many of the journals were conducted. The first attempt at Parliamentary reporting was also resented by the House of Commons as a breach of privilege, but the imprisonments of 1771 ended in the tacit concession of publicity of discussion, which has

ever since prevailed. The Speaker in 1893 excluded the representative of the *London Chronicle* from the Commons gallery, and it was generally accepted as within his power. A greater obstacle encountered by the press was the stamp tax. In 1712 a duty of a halfpenny per sheet was placed on every paper of a sheet and a half. It put an end to Defoe's *Review*, Addison's *Spectator*, and 'all the little penny papers.' The tax was raised in 1757 to a penny a copy; in 1776 to a penny and a half; in 1789, to twopence; in 1794, to twopence-halfpenny; in 1797, to threepence-halfpenny; and in 1815 to fourpence. At this time the usual price per copy was sevenpence. In 1836 the tax was reduced to a penny, and in 1855 abolished altogether. And in 1861 the duty on paper was repealed. As a result, newspapers increased enormously in number, and the price per copy was reduced to the present level, from threepence to a halfpenny.

Notwithstanding these exorbitant imposts, which were at first intended to be as deadly as the old licensing act, many newspapers were established, and as their scope widened they became more and more important. The *Saint James's Post* and the *Saint James's Evening Post*, each started in 1715, were fused in the *Saint James's Chronicle* (1724), the liveliest paper of the period. The *London Daily Post and General Advertiser*, founded in 1726, changed its name in 1752 to the *Public Advertiser*, and was afterwards famous for the contributions of 'Junius.' In 1762 John Wilkes issued the first number of the *North Briton*. The *Morning Chronicle*, established in 1769, was the first newspaper to give adequate reports of Parliamentary debates; it invented the leading article; and in its columns first appeared Hazlitt's dramatic criticisms. It was soon rivaled by the *Morning Post* (1772) and the *Morning Herald* (1781). The *London Daily Universal Register*, begun in 1785, was turned into the *Times* in 1788. From the first, the *Times*, under the direction of John Walter (q.v.), devoted itself mainly to a discussion of public affairs, governmental, educational, and commercial. Its Parliamentary reports and 'leaders' soon became the best, and in course of time it was recognized as 'the leading journal of Europe.' It was the first to discard the hand-press and to substitute steam (1814). In 1846 appeared the *Daily News* with Dickens as editor; and in 1855 the *Daily Telegraph*, the first penny paper of the nineteenth century, which gained an immense audience under the régime of G. A. Sala. The *Standard*, now the chief Conservative newspaper, was started in 1827, as an evening edition of the *Morning Herald*. It made a stout fight against Catholic emancipation. Its cause lost, it lived a lingering life until revived in 1876 by its able editor, W. H. Mudford. Other popular London dailies are the *Globe* (1803); the *Echo* (1868), the first London halfpenny newspaper; the *Pall Mall Gazette* (1865), which John Morley turned from its conservative ways into a powerful Radical organ; *Saint James's Gazette* (1880); the *Evening News* (1881); the *Star* (1888); *Westminster Gazette* (1892); the *Sun* (1893); and the *Daily Mail* (1896), founded by A. C. Harmsworth, who is a striking figure in recent journalism.

The London literary and society papers have a line of connection with Addison. The numerous imitations of the *Spectator* (1711-12) were

VOL. XIV.—31.

essays on manners and literature. The nineteenth century type of the weekly review was set by Leigh Hunt in the *Examiner* (1808), which combined literature and politics. Under its first editor and Albany Fonblanque (q.v.), it had a brilliant career, as an exponent of current radicalism. The *Athenæum* (1828) confines itself to literature, art, and music. Though it has had many rivals, it is to-day one of the most trustworthy reviews in the world. The *Academy* (1869) is similar in design, but runs more to literary gossip. The *Saturday Review* (1855), once the most solid, is now the 'smartest' of English weeklies. The *Spectator* (1828), under R. S. Rintoul, exerted for thirty years a mighty influence for reform. After R. H. Hutton assumed the editorship (1860), it became less radical in tone; and its sane discussions of politics and literature were among the best that journalism has ever offered. It still holds its high position. As the champion of radicalism, the *Speaker* was established in 1890 by T. Wemyss Reid. Other weekly reviews of literature, society, and politics (one or all), are the *Literary World* (1868); the *National Observer* (1887); the *Outlook* (1898); *Literature* (1897); the *Pall Mall Budget* (1868); the *Saint James's Budget* (1880); the *Weekly Sun* (1891); the *Guardian* (1846); the *Weekly Register* (1849); *Pearson's Weekly* (1890); *Vanity Fair* (1868); *Society* (1878); the *Pelican* (1887); the *Critic* (1895); *Lloyd's Newspaper* (1842); *Reynolds's Newspaper* (1850); the *Referee* (1877); the brilliant *World* (1874), founded by Edmund Yates; and *Truth* (1877), edited by Henry Labouchere. Exceedingly popular are several light journals approaching the magazine, such as *Tit-Bits* (1881) and *Answers* (1888). At the head of illustrated weeklies stand the *Illustrated London News* (1842); the *Graphic* (1869); the *Lady's Pictorial* (1880); the *Gentlewoman* (1890); and *Black and White* (1891). There are also reviews for distinct trades, professions, and pastimes; the *Illustrated Sporting and Dramatic News* (1874); the *Cycle* (1893); the *Musicalian* (1897); the *Economist* (1841); the *Statist* (1878), for the markets of finance; *Engineering* (1866); and so on through many phases of contemporary life. Among comic journals *Punch* (q.v.) is still supreme.

The press of London, taken collectively, has passed through three broadly marked stages. It began on a mere transcript of the city's rumor, gossip, and abuse. Repressed by the licensing act for a generation, it took two forms on its repeal, 1695, one literary, of which Addison's *Spectator* was the highest type, and the other bitterly polemic (L'Estrange and Defoe). In these journals, which appeared in quick succession for a century, the personality of the editor was decisive. With the Napoleonic wars English journalism entered on a third stage, led and molded by John Walter, the founder of the *London Times*, in which the personality of the editor became only one factor, though still of importance, in a compact organ of public opinion and vehicle of public news, whose articles were anonymous and whose editor was by a transparent fiction unknown. The weight and influence of journals in this period turned on the success with which editorials expressed the opinions of the ruling forces of the nation, of a party, a class, or an interest, and the accuracy and impartiality with which its

news columns recorded facts. While this type was most completely developed in the *Times*, it was apparent in all English periodicals, daily, weekly, and monthly, from the Napoleonic wars until the defeat of Gladstone's Irish Home Rule Bill recast party relations and based the Conservative-Imperialist majority on a mass vote. With this period, now nearly twenty years distant, English dailies began developing circulation independent of influence, signed articles and the personal journalist became conspicuous, and the publisher with an avowed commercial aim had an increasing control and influence. The earlier newspaper, like the *Times*, waned in weight, and the type of the new is not yet developed.

The earliest provincial English newspaper was the *Worcester Postman* (1690), which, under the name *Berrow's Worcester Journal*, still circulates freely through the West Midlands. Five years later was founded the *Mercury*, now called the *Lincoln, Rutland, and Stamford Mercury*. In 1706 appeared the *Norwich Postman* at a penny, with the announcement that a halfpenny would not be refused. It was followed by the *Norwich Mercury* (1714), which still exists. Among other early successes were the *Nottingham Courant* (1710), which with changed name continued till 1886, when it was incorporated with the illustrated *Weekly Express*; the *Newcastle Courant* (1710), with a present large circulation in the north; the still prosperous *Hereford Journal* (1713); the *Leeds Mercury* (1718), one of the best of provincial papers; the *Salisbury and Winchester Journal* (1729), now an influential paper; and the *Birmingham Gazette* (1741), to-day one of the leading Midland dailies. These examples, without the catalogue of numerous failures, show how the newspaper spread through England early in the seventeenth century. They were, however, small sheets, and continued to be such till about 1860. Still other well-known English papers are the *Leeds-Yorkshire Post* (1754), with a daily since 1866 and an evening issue since 1890; the *Newcastle Chronicle* (1764), now issuing two daily editions; the *Liverpool Courier* (1808), two daily issues and a weekly; the *Leicester Daily Post* (1872); the *Sheffield Weekly Telegraph*, with a circulation of 215,000; and the *Manchester Guardian* (1821), which has a reputation far beyond England for its independence and able comment. Wales depends largely upon the newspapers of the border counties. She has, however, several English journals of her own; as the *North Wales Chronicle* (Bangor, 1807); the *South Wales Daily* (Cardiff, 1872), in the Liberal interest; and the *Western Mail* (1869), in the Conservative interest. A few newspapers are printed in the Welsh language. Among them are *Y Genedl Gymreig* (The Welsh Nation) and *Baner ac Amserau Cymru* (Banner and Times of Wales).

SCOTLAND very naturally had a hand in the numerous sheets employed to circulate information during the civil wars. The first to be printed in Scotland was the *Mercurius Politicus* (Leith, 1653; Edinburgh, 1654-60). Under the title *Mercurius Publicus*, it continued till 1663. The *Mercurius Caledonius* (Edinburgh, 1660) failed after ten issues. The establishment of the newspaper in Scotland was due to James Watson, who was both editor and printer. He started the *Edinburgh Gazette* (1700); the *Edinburgh Courant* (1705), a tri-

weekly, which suspended after fifty-five numbers; and the *Scots Courant* (1706), continued till 1718. In 1718 appeared the *Edinburgh Evening Courant*, and two years later the *Caledonian Mercury*, which continued for nearly a century and a half. The *Scotsman* (Edinburgh, 1817), a daily since 1855, the most substantial journal in Scotland, is also most favorably known in the United States. Among the numerous other good Scotch journals are the *Glasgow Herald* (1782), an independent daily with a weekly issue; the *Glasgow Weekly Mail* (1862); the *Dundee Advertiser* (1801), daily; the *Dundee Weekly News* (1855), having a circulation above 250,000; the *Aberdeen Journal* (1748), daily and weekly; and the *North British Daily Mail* (Glasgow, 1847).

IRELAND. During the civil wars there were printed in London several sheets containing news from Ireland, as *Warrented Tidings from Ireland* (1641) and *Mercurius Hibernicus* (1644). The first real Irish newspaper was the *Dublin News-Letter* (1685). Fifteen years later came the first Dublin daily, *Pue's Occurrences*, which was continued for a half century. In 1728 appeared another daily, *Falkener's Journal*. *Esdaile's News-Letter* (1744), changed to *Saunders's News-Letter* (1754), a Dublin tri-weekly and then a daily, lasted till 1879. The official *Dublin Gazette* (1710?) still continues. The oldest provincial Irish newspapers still existing are the daily *Belfast News Letter* (1737), the semi-weekly *Waterford Chronicle* (1766), and the *Limerick Chronicle* (1766). Among the most flourishing Dublin newspapers are the famous *Freeman's Journal* (1763); the *Weekly Nation* (1847); the *Evening Telegraph* (1877); and *Sport* (1881). The *Belfast Northern Whig* (1824), with a large circulation in Ulster, is also well known outside of Ireland.

THE BRITISH COLONIES. In British North America the chief places from which newspapers (daily and weekly) are diffused are Toronto, Montreal, Ottawa, Quebec, and Halifax. Among the earliest journals were the *Halifax Gazette* (1751), which lasted hardly twenty years, and the *Montreal Gazette* (1765), now a daily and weekly. Toronto, though later in the field, takes the lead to-day with its five dailies and many weeklies, among which are the *Globe* (morning, evening, and weekly), the *Daily Mail*, and *Erening News*. Quebec and Ottawa support several dailies and weeklies in French.

INDIA. The deportation clause in the early libel act, censorship, and a rigid license act restricted journalism in India, and a press law still leaves all newspapers published in the vernacular subject to administrative suppression. Anglo-Indian journalism began with the *Indian World*, Calcutta, edited by William Duane in 1794, deported by the East India Company. He was afterwards editor of the *Aurora*, Philadelphia, Pa. About thirty years later J. S. Buckingham was deported for a like reason. In 1800 nine newspapers were started and soon suspended. Early in the nineteenth century the English papers were the *Englishman*, started in 1821 as *John Bull in the East*, *Hurakarn*, *Calcutta Star*, and *Friend of India*. Much of Rudyard Kipling's early work appeared in the *Lahore Civil and Military Gazette*. In Calcutta nine dailies are published in English and seven in the vernacular. The *Indian Daily Mirror* (1863) is the first daily in English edited by natives. The *Hindu* of

Madras is the oldest daily in that city. In all, five dailies in English are conducted by natives. There are in the Empire about 140 English and about 300 native newspapers. The largest circulation of the latter is 25,000, and most circulate a few hundreds. The vernacular press is for the most part bitterly opposed to the Government, and is generally edited by Bengalis.

AUSTRALASIA AND SOUTH AFRICA. Journalism in Australia began with the *Sydney Gazette* and *New South Wales Advertiser* (1803-04), of which but one complete file is in existence at the Sydney Government House. The history of journalism in Australia is scattered with failures from 1810 to 1860. But to-day the dailies and weeklies of large circulation are numerous. Though the press has been established in the small towns, the great journalistic centres are Melbourne and Sydney; and next to them, Adelaide and Brisbane. We may cite for Melbourne, the *Argus*, the *Age*, and the numerous journals devoted to building, mining, stock-raising, and shipping; for New South Wales, the *Sydney Morning Herald*, the *Australian Star*, and the *Daily Telegraph*; for South Australia, the *Register*; for Queensland, the *Brisbane Courier*. The Australian papers are remarkable for the large number of pages in an issue, larger in proportion to population and circulation than in any other country, particularly in the case of weeklies.

New Zealand's first paper was the *New Zealand Herald* (1841), now consolidated with the *Auckland News*. It was published for a year, revived (1863) by W. C. Wilson, and merged in its present ownership (1864). It is one of two dailies in Auckland. The *Times*, Wellington, is a typical and leading daily. A Maori paper, *Te Pakio Matiriki*, is published by a former chief, Tawhiao. The newspaper has followed the colonist to Cape Colony, Natal, and to other British possessions in Africa, and throughout the world. Cape Colony has several weeklies and three dailies, of which may be mentioned the *Cape Argus* and the *Cape Times*, both daily and weekly.

FRANCE. The now flourishing *Gazette de France* (daily) is the oldest of all French newspapers. As the *Gazette* it was established at Paris in 1831 under the patronage of Richelieu by Théophraste Renaudot (1584-1653). It first appeared week'y with a monthly supplement, and afterwards as a semi-weekly. Being thus a continuous record (except for a slight suspension) of foreign and domestic events for toward three centuries, it possesses very great historical value. In its arrangement of foreign news first and home news last, it also set an example which has generally prevailed in French journalism. Before the close of the seventeenth century it began to give space to commerce, theatrical announcements, and advertisements. The *Gazette Burlesque* (1650-65), the first journal of the kind, aimed to be the *chronique scandaleuse* of Paris. The two types thus established were continued in the *Mercurie Galant* (1672), which, under different names, commonly the *Mercur de France*, was continued, with short interruptions, down to 1853. The rather insipid *Journal de Paris* (1777-1819) is said to have been the first Parisian daily. During the Revolution journals sprang up rapidly as organs of the various

parties, but they soon expired. Two, however, have lived till the present time: the *Journal des Débats* (1789) and the *Moniteur Universel* (1789), the official organ under the first Napoleon. The *Constitutionnel*, in which Sainte-Beuve began the *Causeries du lundi*, dates from 1815. In 1836 were established two cheaper papers, the *Presse* and the *Siècle*, now popular dailies. The *Figaro*, the modern *journal de scandale*, established in 1854, became a daily in 1866. It has had considerable influence on the lighter newspaper in England and elsewhere. The *Charivari* (1832), a *journal satirique*, has likewise been imitated in many countries. The *Patrie*, political, commercial, and literary, was a daily from the first (1841). Of all Parisian newspapers, perhaps the *Temps* (a daily, 1861) has the most solid reputation abroad. The Parisian political press is further represented by the *Soir* (1870), the *Matin* (1884), and many others. The *Petit Journal* (1863), the first French paper selling at five centimes (half the usual price), at once gained a circulation of 100,000. After arrangements were made whereby it could be furnished throughout France at the same price, its daily issue rapidly increased till it reached a million. French newspapers contain less news than the English or the American. Space is thus found for the *feuilleton*, a literary essay, sketch, or short story, an indispensable feature of the French journal. Paris is famous for her weeklies devoted to art, fashion, literature, and the professions. Outside of Paris, the larger towns support several dailies.

BELGIUM. Antwerp has already been mentioned as one of the places from which were issued the news-letters of the sixteenth century. They were succeeded by the *Nieuwe Tijdinghen* of Antwerp (1605?), on which were founded the *Posttijdingen* (1637-44) and the *Gazette van Antwerpen* (down to 1827). To the period 1840-50 belong the *Nieuwe Tijdinghen* of Bruges, the *Brusselsche Gazette*, and *Le Courier Véritable des Pays-Bas* (Brussels), which, as the official *Gazette de Bruxelles* and the *Gazette des Pays-Bas*, continued till 1791. At that time the most outspoken political journal was the *Annales Politiques* of Linguet (often suppressed). The Belgian press, held in firm restraint during the Spanish, Austrian, and French rule, became practically free on the independence of Belgium (1830). Antwerp with its seven dailies has been far outstripped by Brussels, which has now about twenty dailies. The chief are the *Indépendance Belge*, the *Etoile Belge*, and the *Journal de Bruxelles*. At Antwerp and at Ghent dailies are published in Flemish.

HOLLAND. The papers of Holland were long noted for the accuracy of their commercial news. Since 1830 they have given more attention to politics. At present the principal Dutch dailies are the *Allgemeene Handelsblad* and *Nieuws van den Dag*, both of Amsterdam; the *Amsterdamsche Courant*; the *Journal de la Haye*; the *Haagsche Courant*; and the *Staats Courant*—published at The Hague. Other places of active journalism are Haarlem and Rotterdam. Weeklies, several of which are illustrated, are also common.

SWITZERLAND. The Swiss papers are devoted mostly to local interests. They are, however, well managed, especially the dailies at Geneva, Berne, and Lausanne. For tourists there is published at Geneva the *Swiss and Nice Times*, in both French and English.

GERMANY. The news sheets of the sixteenth century led to the newspapers that began to appear just after 1600. Frankfort-on-Main was among the first with the *Frankfurter Journal* (1615) and the *Frankfurter Oberpostamtszeitung* (1616), which, as the *Frankfurter Postzeitung*, lived till 1866. Periodical papers were soon established in other towns, as Strassburg, Nuremberg, Hildesheim, Augsburg, Munich, Hamburg, and Leipzig (1660). The *Hamburgischer Correspondent* (1714), still existing, is famed as being the first to have a regular foreign correspondent, a French refugee living in England (1725-35). The *Allgemeine Zeitung*, started at Augsburg in 1798 and published since 1883 at Munich, from the first a weighty political organ, now ranks among the foremost papers of Germany. The press in Germany was long under severe restrictions. The press laws of Germany are in theory liberal. In practice, however, by a rigid application of the law in regard to lèse-majesté, the courts have come to construe almost any criticism of current administration as an insult to the constituted authorities. Even a comment on the frequency of railroad accidents has been visited with court proceedings, and the editor of *Kladderadatsch* was imprisoned for two months for a cartoon which represented a group of great soldiers of the past reading the Emperor's speech to his guard, declaring that it was necessary to be a good Christian in order to be a good soldier. Berlin has over twenty-five dailies, among which are the *Vossische Zeitung*; the *Norddeutsche Allgemeine Zeitung*; the *Neue Preussische Zeitung*; *National-Zeitung*; the *Tägliche Rundschau*; *Germania*; and the *Volkszeitung*. The *Cologne Gazette* is noted for its foreign news. From all the great cities of Germany issue many weeklies, some of which are illustrated. The leading comic periodicals are *Fliegende Blätter* and *Jugend*, Munich, and *Kladderadatsch*, Berlin.

AUSTRIA-HUNGARY took an active part in the early history of journalism and has kept abreast with modern methods. Of the Vienna dailies, numbering about fifteen, the most important are the *Neue Freie Presse*; *Neues Wiener Tageblatt*; *Wiener Allgemeine Zeitung*; *Deutsche Zeitung*; the semi-official *Fremdenblatt*; and the official *Wiener Zeitung*, with its semi-official evening edition, *Wiener Abendpost*. Budapest has twenty-seven dailies, of which *Pesti Napló* (Pest Daily), *Egyetértés* (Union), and *Pesti Hírlap* (Pest Gazette) are the most prominent in Hungarian, and the *Pester Lloyd* and *Neuer Pester Journal* in German. Among the provincial papers the foremost in Germany are the *Bohemia*, in Prague; the *Grazer Tagespost*, the *Triester Zeitung*; in Czech, the *Národní Listy* (National News), in Prague; in Polish, the *Czas* (Times), in Cracow; and in Italian, the *Indipendente*, in Trieste. As in France, considerable space is given by the press of Germany and Austria to literary reviews and short stories.

SCANDINAVIA. The earliest Swedish paper seems to have been the *Ordinarie Post-Tidende* of Stockholm (1643-80). A little later came the *Bœnski Mercurius* (1675-83) and the *Relationes Curiosæ* in Latin (1682-1701). In the eighteenth century were established two French papers: the *Gazette Française* (1742) and the *Mercure de Suède* (1772). The first political paper of importance in Sweden was the *Argus*, founded by

Johannsen (1820). Ten years later were established the *Fäderneslandet*, the organ of the Royalists, and the *Aftonbladet*, the organ of the Reformers, now the leading dailies of Stockholm. The first Norwegian newspapers were the *Christiania Intelligentsedler* (1763) and the *Adressecontors Efterretninger* (Bergen, 1765). Christiania now has five and Bergen three dailies. In both Norway and Sweden semi-weeklies and tri-weeklies are common. The press of Denmark dates from the *Danske Mercurius* (1666). Down to 1830 the papers of Denmark were made up mostly of extracts from foreign journals; and those outside of Copenhagen are still very poor. Copenhagen now has thirteen dailies, morning and evening, of which the oldest is the *Berlingske Tidende* (1749). The *Aftenposten* enjoys the largest circulation. At Reikjavik in Iceland are published two small journals.

ITALY. As has already been mentioned, Italy with her ancient *Acta Diurna*, and the Venetian gazettes of the sixteenth century, was the original home of the newspaper. The succeeding sheets fell into disfavor with the popes and were denounced in a bull issued by Gregory XIII. The *Diario di Roma* (1716) was the leading Italian newspaper for more than a century. Next followed the existing *Gazzetta di Napoli*. Up to 1848 the newspapers of Italy, subject to strict censorship, were small and politically insignificant. Press laws then became liberal, and as a result newspapers sprang up rapidly. Among the ten Roman dailies may be cited the *Opinione* (established at Turin in 1847 and afterwards removed to Rome); *Diritto*; *Riforma*; *Fanfulla*; and the *Voce della Verità* (in the interest of the Pope). Florence issues the *Corriere Italiano* and two other dailies; Genoa, the *Caffaro* and the *Corriere Mercantile*; Milan, six dailies, among them the influential *Perseveranza*; Turin, five; Venice, four; and Naples, six. There are also several illustrated and humorous weeklies.

THE SPANISH PENINSULA. Though there were earlier sheets published at irregular intervals, the first Spanish newspaper seems to date only from the eighteenth century. Even for some time after 1800 Madrid had only its *Diario*. Indeed, the press in Spain had a hard career till the Revolution of 1854. Dailies in all the chief cities are now numerous. Madrid has about twenty, among which are the *Imparcial* and the *Correspondencia de España*. Among the Madrid illustrated weeklies are the *Correspondencia Ilustrada* and the *Ilustración Española y Americana*. From the American standpoint, the news in Spanish papers is meagre. This is also true of the numerous dailies of Lisbon.

RUSSIA. The earliest newspapers of Russia were issued under the direction of Peter the Great, first at Moscow and then at Saint Petersburg, to report the progress of the war with Sweden. The first gazette, the *Vedomosti*, appeared in Moscow in 1702. The issue of 1703, preserved in the Imperial Library at Saint Petersburg, was reprinted in 1855. Political journalism, however, has never been permitted in Russia except in defense of the Government policy. The flourishing period of the press has been at the time of national crises, as the French invasion of 1812, the Polish insurrection of 1830, and the Crimean War. The official organ is the *Journal de Saint Pétersbourg*. The *Novoe Vremya* (New Times), the *Novosti* (a news and

stock gazette), and the *Severnaya* (Northern Bee) circulate widely from Saint Petersburg. The oldest Moscow daily is the *Moskovskia Vedomosti* (Moscow News), dating from 1766. Russian papers, necessarily occupying themselves mainly with scientific and literary subjects, make much of the *feuilleton*. The weekly *Niva* (Harvestfield) issues two large monthly supplements.

TURKEY. The newspaper was introduced into Turkey by the French, the first being started in Pera in 1795 by Verninhac, French Ambassador. The *Djeridei Havadis*, established in 1843 by Alfred Churchill, an Englishman born in Turkey, is now the leading daily of Constantinople. Beirut is the centre of the Arab press of the Empire. There exist dailies in the capital, also in English, French, Italian, Armenian, and Greek. Owing to the repressive policy of the Government, the editorial is impossible. The contents of a Turkish paper include home and foreign news, a Court gazette, official appointments, advertisements, and a *feuilleton*. Religious weeklies, as the *Avedafer* in Armenian, have played an important part in mission enterprise.

GREECE. During the War of Liberation, many papers appeared in Athens, but they disappeared in 1833 on the introduction of caution money, by King Otho. Then followed the period of the official organ. Now the Athenian press is represented by several journals in Greek, French, Italian, and English; the daily *Akropolis*, *Ephemeris*, and *Nea Ephemeris*; and the weekly *Journal d'Athènes*, and the *Messenger d'Athènes*.

CHINA. The *Peking Gazette* has already been described. It contains a court calendar, Imperial decrees, and memorials from officers of the State. The European journal has been brought to China by the English and the French. Shanghai and Hong Kong have several dailies in English and Chinese. The native press of China is the product of the past twenty-five years. The earliest was the *Cheng-pao* of Shanghai, begun by an Englishman. Major, aided by Chinese literati, circulation, 1895, 12,000; the *Hou-pao* (1883); the *Che-pao* at Tien-tsin; and *Kouang-pao* at Canton. These have been succeeded by a vernacular press all over the Empire, which has a considerable influence. The *Shih Wu-pao* of Shanghai is one of several sheets started by a viceroy, in this case Chang Chih-tung, to counteract the vernacular press in private hands, and in August, 1898, the subject of an Imperial rescript.

JAPAN. Japanese journalism owes its initiative impulse and traditions to Fukazawa, who founded and for many years edited the *Sisi Shimpō*, the leading daily paper in the Empire, published at Tokio. Himself one of the ablest editors of the century, as prolific as Girardin, as full of moral earnestness as Greeley, and as able in directing public policy as Delane, his paper in the early stages of the Miji educated Japan. The first periodical, *Manhō*, appeared in 1863. The first daily, *Mainichi Shimbun*, was established in 1871 at Tokio. Among other Japanese papers worthy of mention are: *Nichi Nichi Shimbun* (1872), Count Ito's organ, *Hochi Shimbun*, *Jisi Shimpō*, *Nippon*, *Kohumin Shimbun*, *Kohumin*, and *Noromo*. The *Miro Miro* is a comic paper. In 1883 Japan had 113 newspapers and periodicals, of which one had 1900 circulation; in 1888, 550, and in 1900, 827, of which Tokio had 201, Osaka 56, and Kioto 51. The dailies number 150,

of which 17 in 1888 had a combined circulation of 130,200.

THE UNITED STATES. The newspaper has an importance in the United States attained nowhere else. A broad area under a common language with a homogeneous population, universal education, easy means of communication, the cheapest mail facilities known, newspaper tolls cheaper in proportion to average distance, though higher for short distances than elsewhere, and a constant interest in political and social affairs, complete freedom from censorship or restriction, except that provided by the libel laws, have given 5 per cent. of the population of the world 40 per cent. of its newspapers. Less accurate than the English newspaper, less well written than the French, less well equipped than the German, the American newspaper occupies a mean position between all three in the extent of its news service, in the freedom of its literary vehicle, and in its habit of treating all subjects from the point of the educator rather than the investigator. Journalism in the United States has shared the conditions due to material circumstances which affect all periodicals. They have already been described for England, where, a dense population occupying a limited area, questions of transportation play a limited part. The journalism of the Revolution, when for newspaper purposes no common communication existed between colonial centres, was limited in influence and circulation to the place and region in which each paper was published, and even the *New York Journal*, in which the Federalist appeared, had small influence outside of New York City. When the postal service was fully organized after the Revolution, but remained subject to special carriage until the organization of an adequate stage service along the Atlantic Coast in the third and fourth decades of the nineteenth century, the rates upon newspapers were so high that their circulation was the luxury of a few, and the small group of newspapers edited at the chief centres by men of a commanding personality, known to the public class of the period, had a most important influence, akin to that of the English journal of the same time, from the general knowledge among men of public affairs of the personality of their editors, and their ability to affect the dominant class of their place and region. The organization of a stage service, in particular between New York and Philadelphia, just prior to the development of railroads, and a reduction in newspaper mail rates gave a wide circulation to weeklies and began the political influence of such newspapers, usually the weekly edition of a daily, which lasted from 1840 to 1875. During this period, as with the *New York Tribune*, the real influence and weight of its editor rested, not upon its daily edition, which in this case was always out-topped in New York City in circulation by two or more papers, but upon its weekly, which circulated throughout all the North. Political and religious weeklies during this period were the most profitable of newspaper properties, and the most potent of political, religious, and social factors. Ten years after the close of the Civil War competition began in the telegraph service, both by cable and by land; tolls dropped, newspaper postage was reduced to a nominal figure, the price of paper per pound began to decrease, train service was improved, the early delivery of the morning paper became possible,

owing to presses capable of printing a large edition rapidly before breakfast within a radius of 200 miles, and during the last quarter of the nineteenth century the daily became dominant. It had for more than half a century held an unchallenged field in all cities of over 100,000 population. The changes just recited extended the newspaper radius of all cities of half a million or over, and dailies which had been important at a remove of 100 or 200 miles over a great centre, in towns from 50,000 to 100,000, while they suffered no loss in their value as local means of communication and business properties, lost their weight in the daily newspaper field as organs of political and social importance, now that circulation which had been measured by the 10,000 down to 1885 was measured by the 100,000. From 1840, when the power press, the railroad, and the telegraph made the modern daily newspaper possible, down to 1875, a circulation of 50,000 in New York City was remarkable, and nearly all newspapers were well satisfied with half of this. From 1875 to 1885 these figures doubled. From 1885 to 1900, with a few exceptions, a newspaper could not be considered in any city of over half a million as of importance unless its daily circulation turned 100,000, and in cities still larger 150,000 to twice these figures was not unknown. The effect of this enormous growth was to change radically both the condition and character of newspapers seeking a large circulation. Where a regulation subscription had been the general source of support, newsstand and street sales became responsible for the great bulk of the edition. Newspapers began sharply to differentiate between the newspaper in each city which sought a large but unstable circulation and the newspaper which aimed at a smaller but secure and more select group of readers. Where one newspaper to the home had been the rule, it became more and more common for the house and office to take from two to five. During the last decade of the nineteenth century, in the struggle for circulation and a general competition, the usual price of the daily newspaper in a large city, which was 4 and 5 cents down to 1880, and from 2 to 3 cents down to 1890, dropped to 1 cent for most of the newspapers having a large circulation, for all in Philadelphia, for all but three English morning newspapers in New York in the general field, while in Boston and Chicago 2 and 3 cents was still maintained. At the same time, a corresponding fall took place in the rate charged for the small 'want' advertisement, and for the special advertising of business firms, a larger and larger share of which was monopolized by 'department stores.'

Boston was first in the field with *Publick Occurrences* (1690), a small quarto sheet, having one page blank. For containing "reflexions of a very high nature," it was suppressed by the Governor of Massachusetts. Next came the *Boston News-Letter* (1704), first conducted by John Campbell, the postmaster. In 1719 it met a bitter rival in the *Boston Gazette*; but with its name changed to the *Massachusetts Gazette and Boston News-Letter*, it grew to be the chief organ of British rule in America down to the evacuation of Boston. In 1721 James Franklin began the *New England Courant*. It suspended in 1727; and two years later Benjamin Franklin, who had been apprenticed to his brother James,

established at Philadelphia the *Pennsylvania Gazette*, which he conducted as a weekly till 1765. The *Pennsylvania Gazette* was then merged in the *North American*. Numerous ventures at Boston led to the *Boston Evening Post* (1735), which was ably conducted as an independent journal down to 1775, when it expired. The new *Boston Gazette* (1755) became the voice of the people against England. To it John Adams contributed the *Letters of Novanglus*. The *Massachusetts Spy* (1770) was another brilliant paper on the Revolutionary side. On the day of the battle of Lexington, it was removed to Worcester, where, after one short suspension, it has continued till the present under the name of the *Worcester Spy*. In other colonies the newspaper had already appeared or was appearing. In 1725 the colonies had two newspapers, one in Boston and one in Philadelphia. At the outbreak of the Revolution the number had increased to 34. The years immediately following saw, amid many failures and successes, the establishment of two dailies: the *Advertiser* of Philadelphia (1784) and the *Advertiser* of New York (1785).

For America, as for the rest of the world, the period of immense expansion in journalism began about 1830, on the establishment of the great New York dailies. The *Daily Sun* (1833), the first penny paper in the United States, was among the pioneers. Reorganized by Charles A. Dana in 1868, it gained wide repute for concise news items and brilliant editorials. The *Herald* (1835), founded by James Gordon Bennett, has long been noted for its exclusive foreign news, often obtained at lavish expense. The *Tribune* (1841), for thirty years under the management of Horace Greeley, was distinguished for its vigorous editorials. It still remains one of the cleanest and most reliable among newspapers. The *Times*, founded in 1851 by Henry James Raymond, has always aimed at sane and conservative comment on contemporary questions. Among other New York dailies of high standing are the *Evening Post* (1801), an independent paper somewhat on the English type, and containing solid and trustworthy book reviews; the *Commercial Advertiser* (evening), which is most favorably known for its financial and literary comment; the *Mail and Express* (evening); and the *Press*, founded in the interests of the Republican Party. The latest phases of modern journalism are represented by the *World* and the *Journal* or *American*. Excellent dailies are also published in German, French, and Italian. New York has found indispensable a few dailies and numerous weeklies devoted to finance and each important branch of trade. Such are: the *Financial News* (daily); the *Journal of Commerce* (daily); *Bradstreet's*; the *Iron Age*, etc. Each department of knowledge and each profession also has its weekly. Of the many illustrated journals *Harper's Weekly* is the oldest. Among others are *Collier's Weekly* and *Frank Leslie's Illustrated Paper*. In 1875 the *Graphic* was the only illustrated daily. Now a daily without illustration is rare. American humor finds expression in *Puck*, *Judge*, and *Life*; criticism in the *Nation*, in many other weeklies, and in the Saturday or Sunday editions of the dailies. The *Times* publishes a Saturday supplement composed wholly of book reviews and literary comment. Among religious journals, which often include literary criticism, are the *Observer* (Presbyterian); the

Churchman (Episcopal); the *Christian Advocate* (Methodist); the *Examiner* (Baptist); the *Independent* and the *Outlook* (liberal); the *Catholic Review*; the *Catholic American*; and many Hebrew weeklies. Sport, art, science, the drama, fashion and society—each has its own periodicals. *Public Opinion* presents a résumé of current thought. New York still leads the American press. But what has been said of her journals is largely true of Boston, Philadelphia, Baltimore, Cincinnati, Chicago, Saint Louis, and San Francisco. And from certain other cities, sometimes small, are issued newspapers which have gained a national reputation. Such are the *Springfield Republican*, the *Detroit Free Press*, the *Louisville Courier-Journal*, and the *New Orleans Picayune*. The last years of the nineteenth century witnessed the rise of the Sunday issue of the great dailies. These immense Sunday magazines, sometimes running above a hundred pages, with colored illustrations, are now published in all the larger cities.

THE MAKING OF THE NEWSPAPER. For a conception of the wonderful progress of the press, one must leave mere annals and enter the workshop. The newspaper such as Defoe edited was nothing more than a brief chronicle of news gathered haphazard, concluding with the advertisement of a quack doctor. Next came the reporter. The special correspondent here and there appeared in the seventeenth century, but he did not gain his place till the Crimean War, and in the United States not till the Civil War. Now every great daily has its hundred correspondents scattered about the globe. This has been rendered practicable by the cable. For saving expense, news agencies have been formed in Europe and America. *Reuter's* (1858) was the first for England. The Associated Press of the United States dates from 1849. Though these serve for the smaller papers, they are to the larger papers only hints to be followed up by their own agents. The telegraph, indispensable for gathering news, has been reinforced by the telephone, which is now finding its way into every village. These new sources for obtaining news have revolutionized the office. The editor who personally superintended the issue of his paper is of the past. There can never be another Greeley or Dana. The editor-in-chief of certain papers finds no time even to write a leader. The work of making the paper must be divided and subdivided. A 'city editor' directs the reporters in gathering news. A 'news editor' keeps in touch with outside correspondents through the telegraph and the telephone. What pours in from the press associations and a paper's own avenues must be thoroughly sifted by 'copy editors,' who now throw out far more than they put in. For important news articles there are usually special writers. 'Exchange editors' read other periodicals with scissors in hand, clipping what they think will interest the public. Comment on the news of the day is in the hands of a trained corps of editorial writers. All these and other departments receive their general instructions from the editor-in-chief, whose place has shifted from the old editorial desk to the telephone. There are, moreover, editors for finance, commerce, and sport, and critics for music, the theatre, and literature. Many papers also now employ a woman, with a corps of assistants, to gather the news especially interesting to women. Finally, there

is the 'night editor,' who makes up the paper, arranging all the articles and the headlines. The Sunday issue is under the direction of a special editor, who has his own staff of correspondents. For providing the Sunday newspapers with stories by popular novelists, syndicates were formed just after 1890. The syndicate purchases the manuscript from the author and sells the right of simultaneous publication to one newspaper in each of the great cities, thus making a handsome profit. The proceeds from the transaction have tempted Stevenson, Kipling, and many other well-known novelists. Much miscellaneous manuscript now passes through syndicates. The counting room of the newspaper we can enter only to remark that an expert is required to look after the advertisements. The income from advertisements, once insignificant, is now so great that even the wealthiest daily could not long survive a serious quarrel with its patrons.

Great as all these developments are, the marvelous changes await one who enters the mechanical department. Down to 1814 all papers were printed on hand-presses. Then the cylinder press of Koenig, run by steam and printing about a thousand copies an hour, was introduced by the *London Times*. In the hands of Sir Rowland Hill, Richard M. Hoe, and other later inventors, the so-called 'web-perfecting press' has reached a stage in its development where it will print, fold, paste, and count more than 100,000 copies of eight-page papers an hour. The most recent presses will also print a sheet in six distinct colors. These improvements have been accompanied by quicker means of stereotyping. Plates may be made and clamped on the press within twelve minutes. In the last decade of the nineteenth century hand typesetting gave way to the linotype machine, which, besides reducing the expense of composition by one-half in New York and by one-third in certain other cities, brought the interval between the reception of the latest news and its publication down to less than half an hour. Between 1875 and 1900 paper suitable for print decreased in cost from 12 to 2 cents a pound. New processes in photography have also made easy the rapid reproduction of pictures. The interval between a snapshot and the printed picture is less than two hours. Electricity is displacing steam. The automobile has been pressed into service for getting newspapers on the street; and for wider circulation special trains are employed.

No observer can fail to notice that under the new régime, where the editor-in-chief counts for less, the press of the United States is becoming less personal and more and more independent. True, nearly all American papers are the voice of some party, but they are not its slaves. Certainly public questions are now discussed with a sanity and calmness rare in earlier years.

STATISTICS. According to estimates at the close of the year 1900, the total number of newspapers published in the world was about 50,000 (an increase of 10,000 during the previous ten years), distributed as follows: United States and Canada, 21,789; Germany, 7000; Great Britain, 9000; France, 4300; Japan, 2000; Italy, 1500; Austria-Hungary, 1200; Asia, exclusive of Japan, 1000; Spain, 850; Russia, 800; Australia, 800; Greece, 600; Switzerland, 450; Holland, 300; Belgium, 300; all others, 1000. Of

the 21,789 estimated for the United States and Canada, only 924 were published in Canada. According to frequency of issue, they ran thus: weekly, 15,375; monthly, 2939; daily, 2279; semi-monthly, 296; semi-weekly, 470; quarterly, 180; bi-weekly, 76; bi-monthly, 68; tri-weekly, 52. The number for each State and Territory in the United States was as follows: Alabama, 231; Alaska, 9; Arizona, 54; Arkansas, 257; California, 698; Colorado, 326; Connecticut, 190; Delaware, 42; District of Columbia, 82; Florida, 159; Georgia, 362; Hawaii, 26; Idaho, 70; Illinois, 1706; Indian Territory, 84; Indiana, 859; Iowa, 1073; Kansas, 703; Kentucky, 314; Louisiana, 192; Maine, 154; Maryland, 211; Massachusetts, 618; Michigan, 790; Minnesota, 653; Mississippi, 222; Missouri, 1033; Montana, 92; Nebraska, 617; Nevada, 30; New Hampshire, 105; New Jersey, 384; New Mexico, 52; New York, 2032; North Carolina, 255; North Dakota, 155; Ohio, 1217; Oklahoma, 125; Oregon, 192; Pennsylvania, 1403; Porto Rico, 7; Rhode Island, 59; South Carolina, 128; South Dakota, 267; Tennessee, 289; Texas, 794; Utah, 77; Vermont, 75; Virginia, 240; Washington, 221; West Virginia, 189; Wisconsin, 642; Wyoming, 41.

The fullest analysis ever made of the commercial side of newspapers for any one country appeared in the United States Census Report for 1900. It varies considerably from the figures compiled by advertising agencies in the number of periodicals, because the latter contain numerous transitory publications of small consequence. The growth of the periodical press in the United States during the last half-century is best shown by the following table:

	All classes			Daily	
	Number	Total circulation per issue	Aggregate number of copies issued during the year	Number	Total circulation per issue
1900.....	18,226	114,299,334	8,168,148,749	2,226	15,102,156
1890.....	14,901	69,138,934	4,681,113,530	1,610	8,387,188
1880.....	11,314	31,779,686	2,067,848,209	971	3,566,395
1870.....	5,871	20,842,475	1,536,548,250	574	2,601,547
1860.....	4,061	13,653,409	927,951,548	387	1,478,435
1850.....	2,526	5,142,177	426,409,978	284	759,454

Complete figures exist in regard to the business of publication only during the past twenty years. These are summarized as follows:

YEAR	Number of publications			Aggregate circulation per issue	Aggregate number of copies issued during the census year
	Total	Reporting	Not Reporting		
1900.....	21,272	18,226	3,046	114,299,334	8,168,148,749
1890.....	17,616	14,901	2,715	69,138,934	4,681,113,530
1880.....	11,314	11,314		31,779,686	2,067,848,209

YEAR	Wage-earners		Pounds of paper used	Value of newspaper products		
	Average number	Total wages		Total	Advertising	Subscriptions and sales
1900.....	94,604	\$50,333,051	1,233,142,248	\$175,789,010	\$95,461,127	\$79,928,483
1890.....	75,437	40,074,937	592,876,161	143,586,448	71,243,361	72,343,087
1880.....	71,615	28,559,336	189,145,048	89,009,074	39,136,306	49,872,769

BIBLIOGRAPHY. The works on the newspaper are all considerably out of date. For a general view of the history of the press down to its recent marvelous development, the best single book is Hudson's *Journalism in the United States*

from 1690 to 1872 (New York, 1873). Hudson gives much information in regard to foreign journalism. *The American Weekly Mercury* for 1719-21, the first American newspaper in the middle colonies, was reprinted by the Colonial Society of Pennsylvania in 1898. For England, consult Grant, *The Newspaper Press* (London, 1871-72); Pebody, *English Journalism* (ib., 1882), a brief account; Jackson, *The Pictorial Press* (ib., 1885); Andrews, *History of British Journalism* (ib., 1859); Fox Bourne, *English Newspapers* (ib., 1887); and the catalogue of the British Museum. Full statistics are given for each year in *Sell's Dictionary of the World's Press* (London). Ayers and Rowell's *Newspaper Directories* give statistics for the United States and Canada. United States Census Reports are most trustworthy. For the Continent, see Hatin, *Histoire politique et littéraire de la presse en France* (8 vols., Paris, 1859-61); and *Les Gazettes de Hollande et la presse clandestine aux XVIIème et XVIIIème siècles* (Paris, 1865); Warzée, *Essai historique et critique des journaux belges* (Ghent, 1845); Larousse, *Grand Dictionnaire Universel* (15 vols., 1866-76; supplements 1878-90), which describes under separate heads the most important journals; Salomon, *Geschichte des deutschen Zeitungswesens*, vol. i. (Leipzig, 1900); and the German encyclopædias, especially Brockhaus's *Konversations-Lexikon* (Leipzig). See also JOURNALISM, COLLEGE; PERIODICAL; and PRINTING.

NEW SWEDEN. The early name of the region between New York and Virginia.

NEWT (ME. *newte*, *ewte*, *efte*, by faulty liaison or sandhi for an *ewte*; a similar instance

in English is *nickname*, and reverse changes are *adder*, *apron*, *auger*, *orange*, *umpire*). A small salamander of the genus *Triton* in Europe and

Asia, and *Diemyctylus* in North America. The most familiar American newt is the red-spotted one (*Diemyctylus viridescens*). When full grown it is about four inches long, and is greenish-brown above, with a line of vermilion dots on

the sides; below, it is orange dotted with black. It inhabits ditches and quiet waters, where it feeds voraciously on all sorts of small aquatic animals. With the beginning of warm weather the females begin to deposit their eggs, which

AMERICAN GREEN NEWT.

1. Adult male of *Diemyctylus viridescens* in the green aquatic dress. 2. Young newt in the vermilion, terrestrial stage. 3. Eggs, attached to a water-weed. 4. An egg, enlarged. 5. Larva, with external gills.

may be laid singly during five or six weeks, and are attached to the leaves of submerged plants. The young hatch in a fortnight or so, and remain in the water, wearing a dull green coat, until the end of the season, when, having completed their first metamorphosis, their gills disappear, the throat and lungs become adapted to breathing air, and they leave the water. Their color now changes to a rich uniform vermilion with fiery button-like spots along the sides. They are then only two or three inches long, and hide under leaves and within rotten logs, feeding upon small worms and the like, but coming out frequently, especially in the night and wet weather. These little creatures are among the prettiest objects in the American woods. This sojourn on land lasts until the autumn of the third or spring of the fourth season, by which time they have nearly attained to full size, and have reached sexual maturity. They then gradually change in color back to the original green, and return to the water, where their lungs cease to act, pharyngeal respiration is reestablished, and they proceed to breed. This species is locally numerous all over the Eastern United States. A much larger species (*Diemyctylus torosus*) occurs in the Western States. It is dark brown in color, yellowish beneath, and the tail is provided with fins. It feeds mainly on earthworms.

EUROPEAN CRESTED NEWT.
Male in breeding dress.

Of the Old World species, the most widely distributed is the crested newt (*Triton cristatus*), which is olive-brown with white blotches on the sides, and the males of which, during the breeding season, have serrated crests along the backs. Another well-known species is the

marbled newt (*Triton marmoratus*), with which the crested newt hybridizes. All newts prefer a cool and moist situation, and hibernate usually in the ground. Some species remain all their lives in the water, while others pass most of their lives on land. They cast their skins from time to time, more frequently when young, and the cast skin is eaten. The breeding habits of all resemble those of our American species. Consult: Gadow, *Amphibia and Reptiles* (London, 1901); Gage, "Life History of the Vermilion-Spotted Newt," in *The American Naturalist* (Philadelphia, 1891); Sherwood, *Salamanders Found in the Vicinity of New York City* (New York, 1895); Jordan, "Habits and Development of Newts," in *Journal of Morphology*, vol. viii. (Boston, 1893).

NEW TESTAMENT. See BIBLE.

NEW TESTAMENT CHRONOLOGY. The science which deals with the dates and order of events in the life of Christ and the Apostolic Age.

1. **THE CHRONOLOGY OF THE LIFE OF CHRIST.** The main data are to be found in the Gospels and checked by comparison with the contemporary events of secular history.

(1) *The Date of the Nativity.*—From Matthew we learn that the birth of Jesus took place "in the days of Herod the King" (ii. 1). The visit of the wise men, the flight of the Holy Family into Egypt, and the massacre of the children under two years of age all preceded Herod's death (ii. 3-18). Thus Herod's death gives us a date later than which the birth of Jesus cannot be placed. According to data in Josephus, it is beyond all doubt that Herod died not long before the Passover of B.C. 4. The star of the wise men may have been the conjunction of Jupiter and Saturn, which occurred in B.C. 7. The Nativity was, however, after the first appearance of the star. Since several events took place between the Nativity and Herod's death, the evidence in Matthew is conclusive only for a date between B.C. 7 and B.C. 4. In Luke ii. 1 the data are more definite. "In those days there went forth a decree from Caesar Augustus that the [Roman] world should be enrolled. This was the first enrollment made when Quirinius was Governor of Syria." The meaning seems to be that this enrollment was the first one of the kind in those regions, and that it was taken while Quirinius was Governor. This definite statement has been the subject of much discussion. The main points in dispute are: whether Augustus ordered an enrollment in Palestine before the famous one of A.D. 6 (which was, curiously enough, while Quirinius was Governor of Syria), and, if so, whether Quirinius was the Roman official intrusted with its execution. As to the first question, documents recently discovered in Egypt supplement our former imperfect knowledge of Augustus's various censuses, so that we are now reasonably sure that about B.C. 9-8 a census was ordered to be taken in Palestine as a part of the second general census of the Empire, in which Palestine was now, for the first time, included. From B.C. 23, for a number of years, a census was taken every fourteen years. It is likely that the census ordered for the year B.C. 9-8 did not actually take place in Palestine, owing to its peculiar circumstances, until B.C. 7. As to the second question, there is a possibility

that Luke has made a mistake in naming Quirinius instead of Saturninus as the Governor of Syria at the time. Thus both Luke and Matthew agree to the effect that the Nativity took place about B.C. 7 or A.U.C. 747. It would seem that further aid might be derived from Luke iii. 1-3 and 23, which verses apparently state that Jesus was thirty years of age in the fifteenth year of Tiberius Caesar. But this is not the case. We are uncertain (1) from what date Luke reckoned the reign of Tiberius; (2) how much latitude is to be allowed to the expression "about thirty years;" and (3) how close the connection is between v. 23 and vv. 1-3. For these reasons we must be content with the result stated above, and date the Nativity about B.C. 7.

There are no data for determining the month and day of the birth of Jesus. Ancient tradition wavered between two dates, January 6th and December 25th, each of which seems to have been the result of calculation, not based on trustworthy tradition.

(2) *The Date of Jesus' Baptism.*—From Luke we learn that John the Baptist took up his work in the fifteenth year of Tiberius. Such, at least, seems to be the meaning of Luke iii. 1-3, "Now in the fifteenth year of the reign of Tiberius Caesar . . . the word of God came unto John . . . in the wilderness." If Luke reckoned the reign of Tiberius from the death of Augustus, the year August A.D. 28-August A.D. 29 would be the year intended. If he counted from A.D. 12, when Tiberius was associated with Augustus, as the first year, then A.D. 26-27 would be the year indicated. Accordingly, the baptism of Jesus was either in A.D. 27 or in A.D. 29. In the Gospel of John we have a datum which enables us to decide between these two dates. In John ii. 20, at the time of Jesus' first public appearance in Jerusalem, which was not long after the beginning of His public ministry, there is the statement that the Temple had been, at the time, forty-six years in the process of construction. Since the reconstruction of the Temple was begun by Herod in B.C. 20-19, the baptism of Jesus could not have been later than A.D. 27. Early in the year A.D. 27 seems, then, the most probable date for this event.

(3) *The Duration of the Ministry.*—The first three Gospels give us only the vaguest hints as to the length of the Lord's public ministry. They begin their narrative of His public life with His work in Galilee after the imprisonment of John the Baptist. But Mark i. 14 ("Now after that John was delivered up, Jesus came into Galilee") seems to imply that some time elapsed between the Temptation and John's imprisonment. This gap is partially filled by the Gospel of John, which also gives a well-ordered arrangement of the events of the ministry narrated by it. Its data are as follows:

- ii. 13 sqq., Jesus in Jerusalem at a Passover, after His baptism and a brief sojourn in Galilee.
- iii. 23 sqq., a brief sojourn, length not stated, in Judea, before John was imprisoned.
- iv. 1-35, Jesus retires into Galilee. On the way, in Samaria, He says to His disciples, "Do ye not say that there are yet four months and the harvest comes?"
- v. 1, Jesus goes up to Jerusalem to attend a feast (unnamed).

vi. 1-4, Jesus is again in Galilee at the time of a Passover.

vii. 2 sqq., Jesus goes to Jerusalem to a Feast of Tabernacles. After this there is no mention of a return to Galilee.

x. 22, Jesus is in Jerusalem at the Feast of Dedication; thence He retires beyond Jordan. While here He is called to Bethany by the death of Lazarus. He then goes to Ephraim in Judea.

xii. 1, six days before the (last) Passover Jesus arrives at Bethany.

Two of these data are somewhat uncertain. The reference in iv. 35 to the "four months, and then cometh the harvest," may indicate the actual season of the year when the words were spoken. In that case Jesus must have passed through Samaria in December or January after His first Passover (John ii. 13 sqq.). If the first Passover was that of A.D. 27, the events narrated in chap. iv. took place in December, A.D. 27, or in January, A.D. 28. But it is possible that the statement in iv. 35 may have been a mere proverbial expression used by Jesus to point a lesson. In that case it has no chronological significance, and the journey through Samaria may have taken place in May, A.D. 27. The unnamed feast of v. 1 ("After these things there was a feast of the Jews, and Jesus went up to Jerusalem") introduces the greatest element of uncertainty. The main question is whether it was a Passover. If it was, then John's Gospel gives us four Passovers in Jesus' public ministry. There are two weighty reasons against taking the reference in this sense. First, John's *usus loquendi* would lead us to expect him to have expressly stated that it was a Passover, if such had been the case. Second, a Passover is expressly indicated in the next chapter (John vi. 1-4). If v. 1 refers to a Passover, we have not only a whole year passed over in complete silence by John, but we also have two whole years and more of active public ministry to place before the Passover of John vi. Since the narrative of John at this place meets that of the other Gospels (Mark vi. 30 and parallels), this does not seem very probable. For such reasons it seems better to take John v. 1 as referring to some minor feast between the two Passovers of ii. 13 sqq. and vi. 1-4. The evidence of the Gospel of John, then, is to the effect that there were three Passovers in the public ministry of Our Lord, those of the years A.D. 27, 28, and 29.

(4) *The Date of the Crucifixion.*—All the Gospels agree that the day of the week was Friday. It is a question whether this Friday was the Passover day or the day after the Passover. Since the Passover always came on the fourteenth day of the Jewish [lunar] month Nisan, the question is, Was Jesus crucified on the 14th or on the 15th of Nisan? On this point the evidence of the Gospels appears contradictory. The Synoptic Gospels positively state that Jesus ate his last supper with His disciples on the Passover evening, i.e. on the 14th of Nisan, and that He was crucified on the next or 15th day. But the Gospel of John in several passages, xiii. 1-2, xviii. 28, xix. 13 and 31, appears to place the Crucifixion on the Passover day. Of the references noted, xviii. 28, "they themselves [the Jews] entered not into

the prætorium, that they might not be defiled, but might eat the Passover," and xix. 14, "Now it was the Preparation (*παρασκευή*) of the Passover," are the most important. It is to be noted, however, that the Gospel of John uses the term *τὸ πάσχα*, the Passover, in an inclusive sense to indicate the whole Passover season, just as the Synoptic Gospels use the term *τὰ ἄζυμα*, the [Feast of] Unleavened Bread, in the same broad sense. It is also to be noted that in xix. 31 and 42 the word *παρασκευή*, literally 'preparation day,' is used in its common significance of Friday. It is therefore possible that in verse 14 we should interpret so as to read "it was the Friday of the Passover season." So understood, there is no conflict between John and the Synoptists. If there is actual disagreement, the evidence may be represented as follows:

NISAN	13	14	15	16	17
Jewish customs fixed according to days of Nisan		Passover meal at evening	Holy Rest Day. First day of the Feast of Unleavened Bread	Wave Sheaf	
Synoptic Gospels, as to—					
(1) Days of the week	Wednesday	Thursday	Friday—i.e. the <i>παρασκευή</i> Crucifixion	Saturday	Sunday
(2) Events		Passover meal, Lord's Supper			Resurrection
Gospel of John, as to—					
(1) Days of the week	Thursday	Friday—the <i>παρασκευή</i>	Saturday—i.e. Sabbath, a 'great Sabbath'; xix. 31	Sunday	
(2) Events	Lord's Supper (not identical with Passover)	Crucifixion		Resurrection	

If the year of the Crucifixion was A.D. 29, the Passover was either in April (17th or 18th) or March (18th). The latter is the more probable date.

We therefore arrive at the following results:

- B.C. 9-7. The annunciations concerning the births of the Baptist and Jesus.
7. Birth of Jesus.
- A.D. 26. John the Baptist opens his ministry.
27. (26) Jesus is baptized by John.
27. (Early in the year) Jesus begins His ministry.
27. The first Passover, in Jerusalem (John ii. 13 sqq.).
- 27-29. Passover to Passover, two years of public activity, a year and some months being spent in Galilee.
29. March 18, Friday, the Crucifixion. On Sunday, March 20th, the Resurrection, and 40 days later the Ascension.

These results differ from those most commonly accepted, mainly in that they make the ministry cover but two years and a little over instead of three years or more. The main specific difference is in regard to the feast of John v. 1, which is usually taken as a Passover. The most commonly accepted year for the Crucifixion is A.D. 30 instead of A.D. 29, as given above.

II. CHRONOLOGY OF THE APOSTOLIC AGE. The Apostolic Age began immediately after the Lord's Ascension. Its close may be considered as marked by the passing away of the Apostles and their companions. Our main authority for this period is the Book of Acts. Incidentally, the Epistles furnish some valuable hints. In Acts we are presented with a sketch of the progress of Chris-

tianity, (1) in the city of Jerusalem, chaps. i-vii.; (2) among the Jewish population of Palestine and Syria, with the transition to work among the Gentiles, chaps. viii.-xii.; and (3) among the Gentiles through the missionary labors of Paul, chaps. xiii.-xxviii. Since the data in reference to Paul's career are more numerous and exact than those connected with the earlier events, we shall make the chronology of Paul's labors the basis of our investigations. We have to consider the evidence furnished by the following data:

(1) *Acts ix. 23 sqq.* Paul's escape from the Jews at Damascus 'many days' after his conversion. In II. Cor. xi. 32 Paul refers to this event, noting that it took place while Aretas was ethnarch of Damascus. In Gal. i. 18 Paul says that he did not leave Damascus for Jerusalem until three years after his conversion.

In all probability Aretas was not ethnarch of Damascus until after the death of Tiberius, March 16, A.D. 37. It is certain that he did not hold this position in A.D. 34. Therefore Paul's conversion was not before A.D. 31, probably not before A.D. 34.

(2) *Acts xi. 27-30 and xii. 25.* Agabus, a prophet, predicted a famine. In consequence, the Christians of Antioch sent aid to Jerusalem by Barnabas and Paul, active workers in the Antioch church. This visit was probably not long before the famine was at its height. Notices in Josephus (*Ant.*, xx. 2, 3 and 5, 2) show that there was such a famine about A.D. 47. The prophecy may well have been uttered two or three years earlier, and the visit may be placed in A.D. 46-47.

(3) *Acts xviii. 7.* Sergius Paulus is mentioned as proconsul of Cyprus. The name of this official has been discovered on an inscription of Cyprus, but his date has not been determined. All that is certain is that he was not proconsul of the island in the years A.D. 51 and 52.

(4) *Acts xviii. 2 and 12.* Paul, soon after his arrival in Corinth on his second missionary journey, meets Aquila and Priscilla, Jews lately banished from Rome in consequence of a decree of the Emperor Claudius. Paul stays in Corinth upward of two years, during which time Gallio was proconsul of Achaia. We have here two data: Claudius's decree and Gallio's proconsulship. The edict of expulsion is mentioned by Suetonius and probably referred to by Tacitus and Dio Cassius, but in such a way that its date cannot be exactly fixed. Orosius (fifth century, A.D.) places it in A.D. 49. As to Gallio,

all that can be said is that he was probably not appointed to the office before the recall of his famous brother Seneca from banishment (A.D. 49). Thus A.D. 49-50 may be accepted provisionally as the most satisfactory date for these facts.

(5) *Acts xx. 6-7*. Paul, on his way to Jerusalem, returning from his third missionary journey, kept the Feast of Unleavened Bread at Philippi, Macedonia. Leaving Philippi, in five days he reached Troas. Here he stayed seven days, leaving on Monday. Reckoning back, it becomes probable, but not certain, that the Passover of that year was on Thursday. In that case, the year was probably either A.D. 56 or 57, the probability being in favor of 56.

(6) *Acts xxiv. 27*. After Paul had been detained as a prisoner for two years, Felix, the Roman Governor of Palestine, was succeeded by Festus. Felix was appointed in A.D. 52 by Claudius, having already been in charge of Samaria for some time. In *Acts xxiv. 10*, two years before Felix's removal, Paul addresses him as having been for 'many years' judge of the nation. The Apostle may have included in the 'many years' the time that Felix spent in Samaria, and the statement should not be pressed as necessitating as many as five or six years after A.D. 52 as the time when they were uttered. Josephus says that Felix, when recalled, had to answer serious charges before Nero, and would have been condemned, had not his wealthy brother Pallas interceded for him. Though Pallas was dismissed from office soon after Nero's accession (A.D. 54), he was for some years a wealthy and influential man. Eusebius's Chronicle places the appointment of Festus in the year September 56-September 57. The accuracy of this statement is not beyond doubt. Paul's words in *Acts xxiv. 10*, as well as the general representation of Felix's administration in Josephus, seem to require a date not earlier than A.D. 58 for the recall of Felix and the appointment of Festus. This date will harmonize with the conclusion reached under No. 5 above.

(7) *The Death of Paul*. All that can be said here is that the most ancient tradition of the Church represents that Paul closed his career by suffering martyrdom at Rome under Nero. As to the date, it is most probable that this took place in the cruel persecution by which Nero sought to divert from himself the suspicion of having burned Rome, i.e. in A.D. 64 or 65.

(8) *The Period Covered by Acts i-xii*. (in reference to the doings of the Jewish-Christian Church of Palestine). The only fixed date we have is the death of Herod Agrippa I. (*Acts xii. 19 sqq.*) in A.D. 44. From this we see that the period covered by these chapters is about fifteen years, since the Crucifixion took place A.D. 29. Within the period we have the probable date, A.D. 34, as that for the conversion of Paul. On the basis of the results thus reached we may construct the following table:

- A.D. 29. Pentecost, first preaching by the Apostles. *Acts ii.*
 29-34 (35). Christianity organized and becomes prominent in Jerusalem. *Acts ii-vi.*
 34 (35). Stephen martyred. Persecution extends Christianity outside Jerusalem. Paul converted at Damascus. *Acts vii-ix.*

34-37 (35-38). Paul in Arabia. His return to Damascus and escape thence. He visits Jerusalem and goes thence to Tarsus. *Gal. i. 17-21; II. Cor. xi. 32; Acts ix. 30.*

34 (35)-44. Rapid extension of Christianity through Palestine, Phœnicia, and Syria, as far as Antioch. *Acts ix-xi.*

38-40?. Paul and Barnabas in Antioch.

44. Execution of James, the brother of John. Peter escapes from Herod Agrippa I., who soon after dies at Cæsarea. *Acts xii.*

46?. Paul and Barnabas carry a contribution to Jerusalem. *Acts xi. 27-30.*

47 (Spring)-48 (Fall). First missionary journey of Paul. *Acts xiii-xiv.*

49 (Pentecost?). The Apostolic Council in Jerusalem. *Acts xv. (cf. Gal. ii. 1-10).*

49. Barnabas and Mark go to Cyprus. *Acts xv. 35-39.*

49. (Fall)-52 (Summer). The Second Missionary Journey. *Acts xv. 49-xviii. 22. I. and II. Thessalonians written from Corinth in 50 and 51.*

52 (Early Fall)-56 (Spring). Third Missionary Journey. *Acts xviii. 23-xxi. 17. I. Corinthians written from Ephesus, 53-54. II. Corinthians written from Macedonia late in spring of 55. Galatians written from somewhere on the journey to Corinth, in summer or fall of 55. Romans written from Corinth in 56.*

56-58. Paul held in Palestine, most of the time in Cæsarea. *Acts xxiii. 1.*

58 (Fall)-59 (Spring). Paul's voyage to Rome.

59-61. Two years' imprisonment in Rome. Epistles to Philippians, Colossians, Philemon, and Ephesians.

61-64. Missionary journey to Spain. Revisits the East. I. Timothy and Titus written.

64. Again imprisoned in Rome. II. Timothy written.

64 (65). Executed by order of Nero. According to tradition, Peter also was martyred at Rome about the same time.

70. The capture of Jerusalem by the Romans under Titus. The Palestinian Christians scattered.

65(?) - 90(?). The Apostle John in Asia Minor (Ephesus).

The table given above differs from the most commonly received chronology (Wieseler's), mainly in that it dates the chief events of Paul's life about two years earlier. Ramsay's dates are, in the main, about one year later than those given above, Harnack's two years earlier.

BIBLIOGRAPHY. Of the large body of literature bearing on New Testament Chronology, particular mention may be made of the following: Ideler, *Handbuch der mathematischen und technischen Chronologie* (Berlin, 1825); Wieseler, *Chronologische Synopse der vier Evangelien* (Hamburg, 1843; Eng. trans., 2d ed., London, 1878); id., *Chronologie des apostolischen Zeitalters* (Göttingen, 1848); id., *Beiträge zur richtigen Würdigung der Evangelien* (Gotha, 1869); Lewin, *Fasti Sacri* (London, 1865); Schürer, *Geschichte des jüdischen Volkes im*

Zeitalter Jesu Christi (Leipzig, 1886-90; Eng. trans., New York, 1891); Harnack, *Chronologie der altchristlichen Litteratur* (Leipzig, 1897); Ramsay, *Saint Paul the Traveler and the Roman Citizen* (New York, 1896); id., *Was Christ Born in Bethlehem?* (London, 1898).

NEW THEOLOGY, **THE**, or **NEW DIVINITY**. A term often applied in the last quarter of the last century to a movement represented by Andover Theological Seminary, and embodied in a small volume by its professors, called *Progressive Orthodoxy*, published in 1886. It became clear finally that the movement was larger and deeper than this, and the term is now generally applied to those forms of theological effort which attempt to incorporate fully in theology the approved results of modern thinking, especially such as are derived from the general theory of evolution. The new theology cannot be said to be a consistent system of thought, nor uniform among its various advocates and promoters. There are left and right wings. But with various differences of emphasis and of the completeness with which the separate results of the new methods are adopted, the new theology may be said to agree in the following points: the acceptance of evolution as the method of divine providence in the spiritual sphere as well as in the material; the employment of the methods of the higher criticism in the discussion of the origin and authority of both Testaments; the rejection of verbal inspiration and the substitution for it of greater, or sometimes exclusive, emphasis upon revelation (see **INSPIRATION**); a subjective view of the atonement; increased emphasis upon ethics in distinction from dogmatics, and upon sociological study and work; restatement of positions in eschatology, with a strong tendency to universalism. The tendency of the school is to minimize the supernatural (miraculous), and in the left wing to exclude it. Every important denomination of Christians has some share in this movement.

NEWTON, nū'ton. A city and the county-seat of Jasper County, Ill., 50 miles southwest of Terre Haute, Ind.; on the Embarras River, and on the Indiana and Illinois Southern and the Peoria, Decatur and Evansville railroads (Map: Illinois, D 5). The surrounding region is well adapted to farming and fruit-growing, and there are also coal deposits. The city manufactures flour, woolen goods, lumber products, brick, and tile. Population, in 1890, 1428; in 1900, 1630.

NEWTON. A city and the county-seat of Jasper County, Iowa, 36 miles east by north of Des Moines; on the Iowa Central and the Chicago, Rock Island and Pacific railroads (Map: Iowa, D 3). It is the seat of Newton Normal College, and has a Carnegie library (\$10,000), and a fine post-office building. The city is surrounded by a district engaged in farming and stock-raising, and manufactures agricultural machines, foundry and machine-shop products, brick and tile, flour, etc. The water-works are owned by the municipality. Population, in 1890, 2564; in 1900, 3682.

NEWTON. A city and the county-seat of Harvey County, Kan., 201 miles southwest of Kansas City; on the Missouri Pacific and the Atchison, Topeka and Santa Fe railroads (Map: Kansas, E 3). It has a public library with over

5000 volumes, and Bethel College (Mennonite). The city is a division point on the Santa Fe Railroad, and, as the centre of a fine farming and stock-raising section, has considerable trade. There are some manufactures, principally flour and grain drills. Newton was settled and incorporated about 1871. It is governed by a mayor, elected biennially, and a council. The water-works are owned and operated by the municipality. Population, in 1890, 5605; in 1900, 6208.

NEWTON. A city in Middlesex County, Mass., adjoining Boston; on the Charles River and on the Boston and Albany Railroad (Map: Massachusetts, E 3). Within the municipal limits are 15 villages, the city occupying an area of about 18 square miles. Newton has a site of great beauty, several hills contributing to its picturesqueness, and it is one of Boston's handsome suburbs. There are 160 acres of city parks, besides the Metropolitan Park reservation (118 acres), and the Metropolitan parkways, which extend along the Charles River. The city maintains a public library (61,400 volumes), and is the seat of the Newton Theological Institution (Baptist), opened in 1825, the Lasell Seminary for women, opened in 1851, and the Allen School for boys, opened in 1853. Among the more prominent buildings are the First Baptist Church and Eliot Church, and the high school and several grammar schools. The Eliot Memorial in honor of the 'Apostle to the Indians' stands near the site of Waban's Wigwam, where John Eliot began on October 28, 1646, to preach to the Indians, in the town called 'Nonantum.' A large cemetery is in the heart of the city. Though Newton is primarily a residential city, it is engaged to a considerable extent in manufacturing. Its industrial establishments include machine shops, fire-alarm supply works, silk mills, worsted mills, rubber works, manufactories of paper boxes, curtains, railway signals, cordage, shoes, etc. The manufacturing interests are promoted by the water power of Charles River. Under a charter, last revised in 1899 and 1902, the government is vested in a mayor, hereafter to be elected for two years, and a board of aldermen, in which each ward is represented by three members—one alderman elected annually by the ward, and two aldermen-at-large elected from the ward on a general ticket, one being chosen each year to serve two years. Some of the administrative officials are elected by the board of aldermen, and some are subject to confirmation by that body upon nomination of the mayor. The school committee is chosen by popular vote for terms of three years. Newton spends annually in maintenance and operation more than \$1,000,000, the principal items being: for interest on debt, \$265,000; for sinking funds, \$119,500; for schools, \$200,000; for drains, parks, sewers, and streets, \$170,000; for the police department, \$70,000; for municipal lighting, \$53,500; for the fire department and wires, \$58,000; for the charity department, \$25,000; for the health department, \$21,000. Newton is one of the wealthiest cities per capita in the United States; the assessed valuation of property, real and personal, in 1902 was about \$62,000,000, and the net debt January 1, 1903, \$4,331,283.94. The water-works are owned and operated by the municipality. Population, in 1890, 24,379; in

1900, 33,587. Settled in 1631 and originally a part of Cambridge (Newtowne), Newton was incorporated as a separate town in 1688, being called New Cambridge until 1692. It was chartered as a city in 1873. Consult Smith, *History of Newton, Massachusetts* (Boston, 1880).

NEWTON. A town and the county-seat of Sussex County, N. J., 60 miles west by north of New York City; on the Delaware, Lackawanna and Western Railroad (Map: New Jersey, C 1). It is known as a summer resort; has the Newton Collegiate Institute and the Dennis Library (subscription), with over 8000 volumes. The surrounding country is largely agricultural, though there is considerable mineral wealth, and the city manufactures shoes, silks, paper boxes, and roofing slate. The water-works are owned by the municipality. Population, in 1890, 3003; in 1900, 4376.

NEWTON, ALFRED (1829—). An English ornithologist and zoölogist. He was born at Geneva, Switzerland, of British parents, and graduated at Magdalene College, Cambridge, in 1853. As a traveling fellow of the college he visited Lapland, Iceland, the West Indies, North America, Spitzbergen, and other countries between the years 1854-64, and by bringing the subject to the notice of the British Association he was instrumental in getting passed the acts of Parliament for the protection of birds. He was made vice-president of the Royal and the Zoölogical Societies, president of the Cambridge Philosophical Society, and received gold medals from the Linnean and the Royal Society. His publications include: *The Zoölogy of Ancient Europe* (1862); *Zoölogy* (1874; 2d ed. 1894); *The Birds of Greenland* (1875); and *A Dictionary of Birds* (1893-96). He edited *The Ibis* for five years (1865-70), and contributed the article on Ornithology to the ninth edition of the *Encyclopædia Britannica*.

NEWTON, CHARLES THOMAS (1816-94). An English archaeologist. He was educated at Christ Church, Oxford. In 1840 he became assistant keeper of the department of antiquities in the British Museum, and in 1852 obtained the appointment of vice-consul at Mytilene, whence he was transferred in 1853 to Rhodes. His position was avowedly in the interest of the British Museum, and his time largely devoted to archaeological travels and excavation. In 1856 he began his great work at Budrun, the ancient Halicarnassus, where he discovered the site of the famous Mausoleum, and recovered many remains of the ancient sculptures. He next worked at Branchidæ and Cnidus, securing valuable results. He was rewarded by an appointment to the consulship at Rome in 1860, and in 1861 was made keeper of Greek and Roman antiquities in the British Museum, a position which he held until failing health led to his resignation in 1885. From 1880 to 1888 he was Yates professor of classical archaeology at the University College, London. In 1861 he married Ann Mary, daughter of the artist Joseph Severn, and herself an artist of high reputation. She died in 1869. Newton's great service lay in widening the narrow circle of classical studies in England, by drawing attention to the importance of art and archaeology in any estimate of Greek life. For the museum his long term proved of great importance, as he was able to secure large grants

and acquire five valuable collections of antiquities. He received the honorary degree of D.C.L. from Oxford in 1875, LL.D. from Cambridge, and Ph.D. from Strassburg in 1879. He published many short papers and discussions, some of which were collected in his *Essays on Art and Archæology* (London, 1880), including the best popular account of Greek inscriptions. Other important works were: *History of Discoveries at Halicarnassus, Cnidus, and Branchidæ* (London, 1862-63) and *Travels and Discoveries in the Levant* (ib., 1865).

NEWTON, GILBERT STUART (1794-1835). An English portrait and genre painter. He was born at Halifax, Nova Scotia, September 20, 1794, the son of Edward Newton, British collector of customs. Newton's parents had quitted Boston after the evacuation by British troops in 1776, but his mother returned to that city upon the death of his father in 1803. He studied painting with his uncle, Gilbert Stuart. In 1817 he traveled in Italy, and studied at Florence, later visiting Paris, where he was influenced by Watteau. He entered the schools of the Royal Academy, and in 1832 was made Academician. Among his chief works are: "The Deserted" (1821), Metropolitan Museum, New York; "The Lovers' Quarrel" (1826); "The Dull Lecture" (1825), Lenox Library, New York; "Don Quixote in His Study" (1828); "The Lute-Player," New York Historical Society; "Yorick and the Grisette" (1830) and "The Widow, or the Dutch Girl" (1829), National Gallery, London; "Portia and Bassanio" (1831), South Kensington Museum; and his last picture, "Abelard," exhibited at the Royal Academy in 1833. Among his portraits are those of Thomas Moore, Sir Walter Scott, and Washington Irving. Newton's pictures, although deficient in drawing, are good in coloring, refined and individual in conception. Suffering from mental derangement, in 1833 he was removed to an asylum at Chelsea, where he died of consumption, August 5, 1835.

NEWTON, HUBERT ANSON (1830-96). An American astronomer and mathematician, best known for his researches on meteors. He was born at Sherburne, N. Y., and graduated at Yale in 1850. In 1855 he was appointed professor of mathematics at Yale. His chief labor, the study of the laws of meteoroids and of comets and their interrelation, began with the attempt to contribute to the theory advanced by Professor Olmsted of Yale in 1833, that meteors were a part of a mass of bodies moving round the sun in a fixed orbit. Newton calculated five possible orbits and showed the mode of deciding between them, by a computation of the secular motion of the node. He supervised the work of the Connecticut Academy of Arts and Sciences in 1861 in regard to the August and November meteors; prepared a map of the heavens for its use; and identified comets with meteors and shooting stars. This led to his valuable statistical study of comets. On these subjects he became a world-wide authority, winning from the National Academy of Sciences the Smith gold medal for his researches on meteors. Many of these were published in the *Memoirs of the National Academy*, the *Journal of Science*, and the *American Journal of Science*.

NEWTON, SIR ISAAC (1642-1727). A famous English mathematician and natural philosopher,

SIR ISAAC NEWTON

FROM AN ENGRAVING BY ROBERT C. BELL, AFTER A PAINTING BY SIR GODFREY KNELLER

born at Woolsthorpe, in Lincolnshire. Newton received his early education at the grammar school of Grantham, in the neighborhood of his home, at Woolsthorpe. On June 5, 1661, he left home for Cambridge, where he was admitted as subsizar at Trinity College. On July 8th following he matriculated as sizar of the same college. He immediately applied himself to mathematical studies, and within a very few years not only made himself master of most of the works of value then existing, but had also begun to make some progress in original methods for extending the science. In the years 1665 and 1666 he made many important mathematical inventions and discoveries, including that of the binomial theorem, the method of tangents of Gregory and Clavius, the direct method of fluxions (integral calculus), and the action of gravity on the moon. According to a legend, which, however, is seriously considered by certain authorities, in the year 1666 the fall of an apple, as Newton sat in his garden at Woolsthorpe, suggested the most magnificent of his subsequent discoveries—the law of universal gravitation (q.v.). On his first attempt, however, to apply the law, to explain the lunar and planetary motions, he employed an estimate then in use of the radius of the earth, which based on the value of a degree of latitude then prevalent, was so erroneous as to produce a discrepancy between the value of the real force of gravity and that required by theory to explain the motions, and indicated only an approximate verification of his theory. He accordingly abandoned for a number of years the hypothesis for other studies, which consisted chiefly of investigations of the nature of light and the construction of telescopes (q.v.). In 1666 he had acquired a prism, and in 1668 completed his first reflecting telescope, with which he observed Jupiter's satellites. In a variety of ingenious and interesting experiments where a spectrum was produced by sunlight refracted through a prism in a darkened room, he was led to the conclusion that rays of light which differ in color differ also in refrangibility. This discovery enabled him to explain an imperfection of the telescope, which had not till then been accounted for. The indistinctness of the image formed by the object-glass was not necessarily due to any imperfection of its form, but to the fact of the different colored rays of light being brought to a focus at different distances. He concluded rightly that it was impossible for an object-glass consisting of a single lens to produce a distinct image. He went further, and too hastily concluding, from a single experiment, that the dispersive power of different substances was proportional to their refractive power, he pronounced it impossible to produce a perfect image by a combination of lenses. This conclusion—since proved erroneous by the invention of the achromatic telescope by Chester More Hall, about 1729, and afterwards, independently, by Dolland (q.v.) in 1751—turned Newton's attention to the construction of reflecting telescopes; and the form devised by him is the one which, at later periods, proved so useful in astronomical researches.

It was on January 11, 1672, that Newton was elected a member of the Royal Society, having become known to that body from his reflecting telescopes, and a month later his famous paper on a "New Theory About Light and Color" was

read before that body, in which he states that "Light consists of rays differently refrangible" and that "Colors are not qualifications of light derived from refractions or natural bodies, as is generally believed, but original and connate properties which in divers rays are divers." He also said that "White light is ever compounded and to its composition are requisite all the aforesaid primary colors mixed in proper proportion." In 1675 Newton communicated to the Royal Society a paper on light and color, which contained an explanation of the production of colors by thin plates or films, and in which were given the results of the first measurements of the colored rings now known as Newton's rings (q.v.). Newton formulated the emission theory of light from hypotheses previously advanced by Descartes, and a complete exposition of that theory was the result. All of Newton's investigations in light and color were collected into a work with the title of *Optica*, published in 1704. The development of the theory was accomplished by rigid dynamical reasoning, and the explanations of reflection, refraction, diffraction, and the colors of thin plates were made on the basis that light consisted of luminous corpuscles sent out from the light-giving body. This theory, while it did not survive the work of Young and Fresnel, nevertheless had more points in common with the undulatory theory than is generally supposed (*Optics*, book ii., part iii., prop. XII.). At what period Newton resumed his calculations about gravitation, employing the more correct measure of the earth obtained by Picard in 1670, does not clearly appear; but it was in the year 1684 that it became known to Halley that he was in possession of the whole theory and its demonstration. It was on the urgent solicitation of Halley that he was induced to commit to a systematic treatise these principles and their demonstrations. The principal results of his discoveries were set down in a treatise called *De Motu Corporum*, and were afterwards more completely unfolded in the great work entitled *Philosophiæ Naturalis Principia Mathematica*, which was finally published about midsummer, 1687.

Shortly before the *Principia* was given to the public, Newton, who since 1669 had occupied the Lucasian chair at Cambridge, was called to take an active part in defending the rights of the university against the illegal encroachments of James II. The conspicuous part which he had taken on that occasion procured him a seat in the Convention Parliament, in which he sat from January, 1689, to its dissolution in 1690. In 1696 he was appointed warden of the mint, and in 1699 was promoted to the office of master of the mint, an office which he held till the end of his life. He again took a seat in Parliament in the year 1701, as the representative of his university. Thus engaged in the public service, he had little time left for mere scientific studies—pursuits which he always held of secondary importance to the public duties in which he was engaged. In the interval of public duty, however, Newton showed that he still retained the scientific power by which his great discoveries had been made. He was president of the Royal Society from 1703 till his death, a period of twenty-four years, being each year reflected. In this position, and enjoying the confidence of Prince George of Denmark, he did much toward the advancement of science; and one of his most

important works during this time was the superintendence of the publication of Flamsteed's *Greenwich Observations*—a task, however, not accomplished without much controversy and some bitterness between himself and that astronomer. The controversy between Newton and Leibnitz, as to priority of discovery of the differential calculus, or the method of fluxions, was raised rather through the partisanship of jealous friends than through the anxiety of the philosophers themselves, who were, however, induced to enter into and carry on the dispute with some degree of bitterness and mutual recrimination. The details of these controversies, with all other information of the life of this philosopher, will be found admirably collected in the biography by Brewster, who wrote, not only with an intimate acquaintance with Newton's works, but in possession of all the materials collected in the hands of his family. Newton died on March 20, 1727, and his remains received a resting-place in Westminster Abbey, where a monument was erected to his memory in 1731. A magnificent full-length statue of the philosopher, executed by Roubilliac, was erected in 1755 in the antechapel of Trinity College, Cambridge. This work was assisted by a cast of the face taken after death, which is preserved in the University Library at Cambridge. In 1699 Newton was elected a foreign associate of the Academy of Sciences, and in 1705 he received the honor of knighthood from Queen Anne. Among the best editions of Newton's principal works are the quarto edition of the *Optics* (London, 1704), and the quarto edition of the *Principia*, published at Cambridge, England, in 1713. Consult: Brewster, *Memoirs of the Life, Writings, and Discoveries of Sir Isaac Newton* (London, 1855-60); Pemberton, *View of Sir Isaac Newton's Philosophy* (ib., 1728); Ball, *History of Mathematics* (ib., 1893); id., *Essay on Newton's Principia* (ib., 1893); and Glazebrook, in the *Dictionary of National Biography*, xl. (New York, 1894).

NEWTON, JOHN (1622-78). An English mathematician and astronomer, born at Oundle, Northamptonshire. He studied at Oxford and remained loyal to the King under Cromwell. Newton was something of an educational reformer, urged intelligent instruction in mathematics, and wrote text-books on arithmetic, geometry, astronomy, logic, and rhetoric. But his most important labors were for the facilitation of the decimal system and of logarithms. His *Institutio Mathematica*, with its logarithmic tables and descriptions of applications to astronomy, dialing, and navigation (1654), is one of the earliest books of its kind in English.

NEWTON, JOHN (1725-1807). A Church of England divine. He was born in London, July 24, 1725, son of a sea-captain. After a little time at a boarding-school in Essex, he went to sea with his father at the age of eleven. During the next six years he made other voyages with his father and adopted infidel opinions. He became midshipman on a man-of-war, but deserted, was caught, flogged, and degraded. In 1745 he set sail for India as a common sailor, and was landed penniless on the African coast near Sierra Leone. In 1747 an English captain, arriving at Sierra Leone with a request from his father to look out for him, rescued him from

a most degraded condition, and took him home. On the voyage during a storm he became converted, and thenceforth was a changed man. Soon afterwards he was appointed commander of an African slaver, and for four years continued in the slave trade, the cruelties of which afterwards he labored earnestly to expose. In 1754 a sudden attack of sickness led him to abandon a seafaring life, and from 1775 to 1780 he was tide-surveyor at Liverpool. At this time he studied Greek and Hebrew, and the best theological works in Latin, French, and English. In 1764 he was ordained and appointed curate of the parish of Olney, Buckinghamshire, where he remained sixteen years. He entered heartily into the religious work and views of Wesley and Whitefield. At Olney he published in 1764 *An Authentic Narrative of Some Remarkable and Interesting Particulars in the Life of the Rev. John Newton*. Here, too, he formed an intimate friendship with Cowper, and in connection with him produced the *Olney Hymns* (1779). Most of them were written by himself for the use of his congregation. In 1780 he became rector of the united parishes of Saint Mary Woolnoth and Saint Mary Woolchurch, Lombard Street, London, where he remained till his death, in London, December 21, 1807. His works, besides those already mentioned, were a *Review of Ecclesiastical History* (1770); *Omicron's Letters* (1774); *Cardiphonia, or the Utterances of the Heart* (1781); *Messiah: Fifty Discourses on the Scriptural Passages of the Oratorio of Handel* (1786); and numerous sermons, discourses, tracts, and letters. His collected works were edited with memoir by Cecil (London, 1808). Consult, also, the memoir by Bickersteth (ib., 1843).

NEWTON, JOHN (1823-95). An American military and civil engineer and soldier. He was born in Virginia and was educated at West Point, receiving a commission in the Corps of Engineers on his graduation in 1842. After serving as assistant professor of engineering at the United States Military Academy for three years, he was occupied with the construction of fortifications and river and harbor improvement on the Atlantic coast. During the Civil War, after receiving the rank of brigadier-general of volunteers, he was summoned to assist in constructing the defenses of Washington. He took part in the battles of Gaines's Mill, Glendale, South Mountain, and Antietam, and in command of a division he was present at Fredericksburg, at Salem, and at Gettysburg. In the invasion of Georgia he led a division of the Army of the Cumberland through all the engagements preceding the capture of Atlanta, and March 13, 1865, he was made brevet major in the United States Army. After the war he was occupied in strengthening the defenses of New York Harbor, in removing the obstacles to navigation at Hell Gate (q.v.) and other portions of the East River, in harbor improvements at Lake Champlain, and New York Harbor. June 30, 1879, he attained the rank of colonel in the corps of engineers; in 1884 was made brigadier-general and chief of engineers; retired in 1886. He was commissioner of public works, New York City, 1887-88, a position which he resigned to become president of the Panama Railroad Company in 1888.

NEWTON, RICHARD HEEER (1840—). A clergyman of the Protestant Episcopal Church.

He was born in Philadelphia. He studied at the University of Pennsylvania and Philadelphia Divinity School, and was ordained in 1862. From 1869 to 1902 he was rector of All Souls' Church in New York City, and in the latter year accepted the position of chaplain at Leland Stanford, Jr., University at Palo Alto, Cal. He belongs to the 'broad church' party and has won distinction for his advocacy of liberal ideas. He has published: *Studies of Jesus* (1881); *Right and Wrong Uses of the Bible* (1883); *The Book of the Beginnings* (1884); *Philistinism* (1885); *Social Studies* (1887); *Church and Creed* (1891); *Christian Science* (1898).

NEWTON-ABBOT. A market-town in Devonshire, England, on the Teign estuary at the mouth of the Lemon, 15 miles south of Exeter (Map: England, C 6). It has railway works, a shipping trade, and considerable commerce in agricultural produce and cattle. Its principal industry is the manufacture of ornamental pottery from china clay and potter's clay, found in the neighborhood. Lignite and tin ore are mined. It has some interesting old buildings, a town hall, and municipal markets. In the vicinity are important remains of a Roman encampment. Charles I. lodged at Newton-Abbot during his western campaign, and here William III. was first proclaimed King in 1688. Population, in 1891, 11,000; in 1901, 12,500.

NEWTON-IN-MAKERFIELD, māk'ēr-fēld, or **NEWTON-LE-WILLOWS.** A manufacturing town in Lancashire, England, 15 miles west of Manchester (Map: England, D 3). The chief industries are paper-making, printing, sugar refining, railway wagon manufacturing, and coal-mining. It has a town hall, mechanics' institute, and grammar school. There is a beautiful lake in the town called Newton Mere, which is covered, during the summer months, with the pleasure-boats of the residents. Horse-races are held here in June, and horse and cattle fairs in May and August annually. The barony belonged to Edward the Confessor. Population, in 1891, 12,861; in 1901, 16,699.

NEWTON'S RINGS. The colored rings seen when a thin film of air or other substance intervenes between the surfaces of two plates of glass. This phenomenon is named from its discoverer, Sir Isaac Newton, who in his work on *Optics* describes how he took a plano-convex lens designed for a fourteen-foot telescope and placed it with its plane side downward on top of a double convex lens constructed for a telescope of about fifty feet in length. On slowly pressing the upper lens against the lower, a number of concentric rings having the point of contact of the lenses as their centre appeared, increasing in size as the pressure was increased. This arrangement of a lens and plane surface is often employed in performing the experiment, and the thickness of the film and the wave lengths of the different kinds of lights can be ascertained. The effect is due to the interference (q.v.) of the waves of light reflected from the upper and lower surfaces of the thin film of air, which from nothing at the point of contact gradually increases in thickness with the distance from the centre. If light of one color, or, speaking more scientifically, of a single wave length, is used, the rings will be alternately bright and dark, the bright waves being produced by the

combination of the various waves caused by interference and overlapping. Therefore the colors of Newton's rings are not pure spectral colors, though they are extremely brilliant and varied. In the centre, where the glass surfaces are in contact, there is a dark spot, and as the air film begins to have an appreciable thickness the rings are formed. They were divided by Newton into a series of orders, seven in number, though usually not more than four or five are seen. The colors of the first order, from the central black circle outward, are gray, whitish, straw color, orange, brick-red, and dark purple, the last color corresponding to a thickness of the film of .000011 of an inch or .00028 of a millimeter. In the second order we have the purest colors, which run through a succession of violet, blue, peacock, yellow, orange, red, and violet, the thickness of the air film in the last instance amounting to .000022 of an inch or .00055 of a millimeter; in the third and fourth orders we also have a succession of colors; in the fifth we have pale green, pale rose, and rose; in the sixth, pale peacock, and pale rose and rose; and in the seventh, pale green and rose. When the thickness of the film reaches .001 millimeter the color appears as pale green, and is included in the fourth order, but from this point the colors begin to fade and disappear. By means of these rings we are enabled to measure the distance between two transparent surfaces which are in seeming contact. In case the light passes through the plates instead of being reflected, the colors are reversed, and we have the rings formed with the complementary colors. See LIGHT, sections *Interference* and *Diffraction*. Consult: Thompson, *Light Visible and Invisible*; Preston, *Theory of Light* (New York, 1894).

NEWTON THEOLOGICAL INSTITUTION. A divinity school at Newton Centre, Mass., founded in 1825, under the supervision of the Baptist churches of New England, but open to members of any Christian denomination. It has a three years' course leading to the degree of bachelor of divinity. In 1902 there were 8 instructors and 61 students. The buildings, eight in number, are valued with the grounds at \$400,000. The institution has a library of 24,000 volumes, an endowment of \$800,000, and property estimated at \$1,300,000.

NEWTOWN. Formerly a town in Queens County, N. Y., since 1898 included in the Borough of Queens, New York City (q.v.) (Map: New York City, G 6). Newtown was founded by New Englanders in 1652, and was known as Middleburgh until 1664, when it came under the jurisdiction of Connecticut, and was renamed Hastings. It received its present name and became part of New York in 1665. During the Revolution it was occupied for some time by British troops. Consult J. Riker, Jr., *The Annals of Newtown* (New York, 1852).

NEWTOWNARDS, nū'ton-ārdz'. A town in county Down, Ireland, 13 miles by rail from Belfast, on Lough Strangford (Map: Ireland, F 2). It has many interesting ruins, notably those of the Old Parish Church. For a hundred years the manufacture of linen goods has been the most important industry. Newtownards was chartered as a borough by James I. Population, in 1901, 9110.

NEW ULM. A city and the county-seat of Brown County, Minn., 26 miles west by north of Mankato; on the Minnesota River, and on the Chicago and Northwestern and the Minneapolis and Saint Louis railroads (Map: Minnesota, D 6). It has a handsome court house, Saint Alexander Hospital, a public library and high school and Turnverein libraries, Saint Michael's Academy, and Dr. Martin Luther College (Lutheran). New Ulm is the centre of a rich agricultural and stock-raising section, and carries on considerable trade. Its industrial establishments comprise grain elevators and flour mills, breweries, cigar factories, brick plants, machine shops, cooperage shops, and manufactories of pipe organs, woollens, pottery, and creamery products. Under a revised charter of 1891, the government is vested in a mayor, elected biennially, and a council. There are municipal water-works and electric-light plants. Settled in 1854, New Ulm was incorporated in 1876. It was in 1862 the scene of an Indian massacre. A memorial has been erected to the citizen soldiers killed by the Indians, and on Hermann Heights is a fine monument in honor of Hermann (Arminius). Population, in 1890, 3741; in 1900, 5403.

NEW WAY TO PAY OLD DEBTS. A. A play by Massinger, printed in 1632. It was written probably in 1625. Fletcher has been credited with a share in it, but his part, if any, was slight. It was the most popular of Massinger's plays, and was acted until recent times.

NEW WESTMINSTER. The former capital and one of the chief cities of the Province of British Columbia, Canada, on Fraser River, in the midst of the gold region, 15 miles above the mouth of the river, 75 miles northeast of Victoria (Map: British Columbia, E 5). The river at this point is about a mile wide and contains several inhabited islands. The terminus of the Great Northern Railway via Blaine is on the opposite bank. The city is the centre of considerable tracts of arable land, is delightfully located, has a fine climate, and a heavy rainfall. Its leading industry is salmon fishing, several establishments exporting the fish in cans and barrels. Other kinds of fish are caught for this trade. Fish oil is manufactured. New Westminster has also a large traffic in lumber and furs, a woolen mill, foundries, iron works, machine and carriage factories, etc. Anthracite and bituminous coal are exported. There are, in the city, Methodist and Roman Catholic colleges, the provincial asylum for the insane, the Dominion penitentiary, and public library; and New Westminster has municipal water-works, electric lights, an electric street railroad, and public parks. Population, in 1891, 6678; in 1901, 6499.

NEW YEAR'S DAY. The first day of the year. The custom of celebrating by some religious observance, generally accompanied by festive rejoicing, the first day of the year, appears to have prevailed among most of the ancient nations. The Jews, the Egyptians, the Chinese, the Romans, and the Mohammedans, although differing as to the time from which they reckoned the commencement of the year, all regarded it as a day of special interest. In Rome the year anciently began in March; and when Numa, according to the ancient legend, made the

year begin on January 1st, that day was held sacred to *Janus Bifrons*, who was thus supposed to turn at once back upon the old year and forward into the new. On the establishment of Christianity, the usage of a solemn inauguration of the new year was retained; but considerable variety prevailed, both as to the time and as to the manner of its celebration. Christmas Day, the Annunciation (March 25th), Easter Day, and March 1st have all, at different times or places, shared with January 1st the honor of opening the new year; nor was it till late in the sixteenth century that January 1st was in most countries accepted as the first day of the new year. The early fathers—Chrysostom, Ambrose, Augustine, Peter Chrysologus, and others—in reprobation of the immoral and superstitious observances of the pagan festival, prohibited in Christian use all festive celebration; and, on the contrary, directed that the Christian year should be opened with a day of prayer, fasting, and humiliation. The mandate, however, was but partially observed.

The social observances of the first day of the new year appear to have been in substance the same in all ages. From the earliest recorded celebration we find notice of feasting and the interchange of presents. Tradition referred the origin of New Year's gifts among the Romans to Tattius, King of the Sabines (B.C. 747). Branches cut from the wood consecrated to Strenia, the goddess of strength, were received by him on the first day of the new year as presents of good omen. He sanctioned the custom and called the gifts *strenæ* (cf. French *jour d'étrennes*). In later times in Rome similar practices attended the worship of Salus. Simple *strenæ*, consisting of branches of bay and of palm, sweetmeats made of honey, figs, or dates as a good omen that the year might bring only joy and happiness (Ovid, *Fasti*, i., 185-190), finally gave way to gifts of more elaborate character. The custom of presenting gifts to the Emperor became so general that the people went *en masse* to carry him presents and to wish him a happy new year. The writers of the Empire describe other observances—exchanging visits, masquerading, and feasting—which characterized the day. The festival held by the Druids at the opening of the year resembles the worship of Salus by the Romans. The priests cut the sacred plant and distributed the sprays. In many countries the night before New Year's, 'Saint Sylvester's Eve,' was celebrated with great festivity, which was prolonged till after twelve o'clock, when the new year was ushered in with congratulations, visits, and mutual wishes for a happy new year. This is an ancient Scottish custom, which also prevails in many parts of Germany, where the form of wish—"Prosst- (for the Lat. *prosit*) Neu-jahr"—"May the new year be happy"—attests the antiquity of the custom. In many places the practice of tolling bells at midnight, and thus 'ringing in the new year,' is still observed. Many religious communions are wont to celebrate it with a special service or watch night. In the Roman Catholic Church the *Te Deum* is often sung at the close of the old year in thanksgiving for the blessings granted during its course, and New Year's Day is a holy day of obligation, because on it falls the Feast of the Circumcision.

NEW YORK (popularly called the 'Empire State'). A North Atlantic State of the United

States. It lies between latitudes 40° 30' and 45° 1' north, longitudes 71° 51' and 79° 46' west, and is bounded on the northwest by Lake Ontario and the Saint Lawrence River, which separate it from the Canadian Province of Ontario; on the north by the Province of Quebec; and on the east by the States of Vermont, Massachusetts, and Connecticut, a part of the Vermont boundary being formed by Lake Champlain. On the south the Atlantic Ocean and its arms, Long Island Sound, New York Bay, and Staten Island Sound, surround Long Island and Staten Island, which belong to the State, while the mainland portion is bounded by a part of these waters and by the States of New Jersey and Pennsylvania. On the west the boundary is completed by the latter State, together with Lake Erie and the Niagara River. New York has roughly the shape of a triangle, with the base on the Great Lakes and the apex extending down to the ocean. Its extreme length from north to south is 312 miles, and from east to west 326 miles. It ranks twenty-sixth in size among the States, its area being 49,170 square miles, of which 47,620 square miles are land surface.

TOPOGRAPHY. The topographical features of New York are varied and complex, but a certain number of more or less well-marked physical divisions may be recognized. The great Appalachian belt first comes out upon the coast in this State. The Piedmont plain, which has such a distinctive development farther south, is here scarcely represented; and the coastal plain is represented only by Long Island, which is low and sandy, with an average elevation of about 70 feet and a maximum of 380 feet. The first division of the mainland, covering the southeastern corner of the State, consists of the Highlands, an extension of the Highlands of New Jersey. It is a rugged region rising in some of its peaks to a height of about 1500 feet, and is pierced by the Hudson in a magnificent gorge. It falls into gentle undulations toward Long Island Sound and New York Bay. Northwest and north of the Highlands follows an extension of the Kittatinny Valley of New Jersey. This is low compared with the neighboring elevations, but east of the Hudson the land rises into the Taconic Range, 2800 feet high, which runs along the eastern boundary into Massachusetts and Vermont, where its extension forms the Green Mountains. West of this Taconic region rises the extension of the Pennsylvanian part of the Appalachian system in the form of a vast plateau covering more than one-third of the State, and reaching from the Hudson to within two or three miles of Lake Erie. It is deeply eroded by river valleys lying in places over 1000 feet below the higher portions. Its eastern part rises in many peaks over 3000 feet in the wild and much dissected mountain region known as the Catskills, whose highest peak, Slide Mountain, has an altitude of 4205 feet. South of the Catskills are the Shawangunk Mountains. The average elevation of the western part of the great plateau is about 1200 feet, with some points reaching 2000 feet. Throughout its length on the north, east, and southeast, it is bounded by a limestone escarpment in some places very high and abrupt, and known in the east as the Helderberg Mountain. North of this escarpment is a low-lying region, forming in the west the lake shore plain and in the east the Mohawk Valley. The latter is bounded on the north by

an irregular and hilly country, which merges imperceptibly into the last great topographical region, the Adirondacks. The Adirondacks with their outlying hills cover the entire northern part of the State. Their central portion is heavily forested, and is a famous summer resort. Several of their peaks are over 4000 feet high, and Mount Marcy, the highest point in the State, has an altitude of 5344 feet.

HYDROGRAPHY. The rivers of the State flow in all directions, and supply five main systems—the Saint Lawrence, Hudson, Mississippi, Susquehanna, and Delaware. The Saint Lawrence drainage basin is the largest in the State, but includes mostly small streams flowing into Lakes Erie and Ontario, the Saint Lawrence River, and Lake Champlain. The largest of these streams are the Genesee, the Oswego, and the Black rivers, all emptying into Lake Ontario. The second drainage basin is that of the Hudson—the only large river flowing entirely within the State. It explains in large part the commercial supremacy of New York, since through its western branch-valley of the Mohawk, through which it has been practicable to construct a canal, it opens a continuous waterway into the heart of the Continent. Even before the Erie Canal was constructed the Hudson and Mohawk valleys constituted an important trade route between the Atlantic and the Great Lakes. The Delaware and Susquehanna rivers both rise in this State, draining its south-central portion. The latter is a large river before it crosses the boundary, but is not navigable. The Mississippi system is represented only by the Allegheny River in the extreme western part of the State. Many of the rivers flow through picturesque gorges, and are broken by falls and rapids, the most noted of which, besides Niagara, are those of the Genesee at Rochester.

New York is dotted with numerous lakes celebrated for beauty. Some of them are of considerable size, and nearly all are of elongated type, formed by the damming of river valleys by glacial materials. This type appears most conspicuously in the group known as the Finger Lakes in the western part of the State. They lie nearly parallel in a north and south direction. The largest are Lakes Seneca and Cayuga, each nearly 40 miles long and from 2 to 3 miles wide. Lake Chautauqua in the extreme west and the picturesque Lake George in the extreme east are of similar formation, as is also Oneida Lake in the central portion, though the last has a width of over 5 miles, with a length of 20 miles. The Adirondack region abounds in mountain lakes of romantic beauty.

CLIMATE. The climate of the State is of the continental rather than the insular type, though the extreme coastal regions of Long Island are somewhat tempered by the ocean. The range of temperature is nowhere as great as in the States of the Northwestern plains. The average maximum is about 100° and the minimum zero, or a few degrees below, but these figures vary much with the topography, the winters in the Adirondacks being very cold. The mean temperature for January is 30° on the coast, 26° in the northwest, and 15° in the Adirondacks. The corresponding figures for July are 72°, 70°, and 64°. The rainfall is abundant throughout the State. In the Adirondacks it is nearly 60 inches, and at New York City, 42 inches. In the rest of the State

it ranges between 35 and 45 inches, being least in the northwest.

GEOLOGY. There are two areas of Archæan rocks, which probably represent the portions of the State that rose above the pre-Cambrian ocean. These are the Adirondack region of the north and the Highlands of the extreme south. Both consist of very ancient crystalline and metamorphic rocks, granites, gneisses, etc., with intruded basic rocks forming the central or Mount Marcy group of the Adirondacks. The northern Archæan area is flanked on the north by outcrops of Potsdam sandstone of the Cambrian Age, and again on all sides by a narrow band of Trenton limestone, while a tongue of Lower Cambrian extends from the southern end of Lake Champlain toward the Hudson Valley. In the early Silurian Age a great upheaval connected the Adirondacks with the Highlands and raised above sea-level the regions bordering these on the west. That portion now appears as Lower Silurian slates and limestones, running in a great curve from Lake Ontario toward Lake George, and thence south and southward into the Kittatinny Valley of New Jersey. On this formation the Upper Silurian rests unconformably and crops out along the southern shore of Lake Ontario. The rest of the State, including the entire southwestern and south-central portion as far east as the Hudson Valley, remained submerged until the close of the Devonian Age, when, in the early Carboniferous Age, it was raised by the great Appalachian upheaval. This portion is now covered by rocks of the Devonian system, forming the great western plateau, which is terminated by the abrupt escarpment formed by the Helderberg limestone. The eastern portion of the plateau is more folded and upturned than the western, and is capped by harder sandstone, whence it remains at a higher level as the Catskill Mountains. The Upper Devonian may have been overlain by a light Carboniferous stratum; but if so, the latter has been entirely worn away, and the State contains no rocks later than the Upper Devonian, with the exception of a small area of Triassic and Cretaceous strata in the southeastern part. Glacial action has been very effective in shaping the present topography of New York, by the formation of lakes, the changing of river courses, the scooping out of some valleys and filling in of others, and the deposition of moraine materials, these materials covering the older rock-formations in an irregular sheet from a few inches to several hundred feet in thickness, and constituting the principal soil of the State.

MINERAL RESOURCES. The coal measures, which are so extensively developed south of the boundary, are not represented in this State. There are valuable clay deposits in the lowlands around the lakes and river valleys, formed by the deposits from the larger lakes which covered those regions in Pleistocene times. The granites of the Archæan regions, the limestones of the Trenton and Niagara formations in the northwest, and the Potsdam and Catskill sandstones, especially those layers of the Hamilton group known as the Hudson River bluestone, form valuable sources of building stone. The principal metallic ore is iron, which occurs in extensive beds of magnetite and hermatite in the crystalline rocks of the Adirondacks. Interbedded with the shales of the Upper Silurian strata south of

Lake Ontario are extensive deposits of rock salt from 15 to 150 feet thick, while other minerals are found in smaller quantities in various parts of the State.

MINING. New York has no coal mines, and is in this respect in marked contrast with the sister Commonwealth of Pennsylvania. The State ranks high in the stone-quarrying industry. All the more important varieties of stone, as well as industrial clays, are worked. The output of limestone in 1900 was valued at \$1,730,162, the largest for any year in the decade 1890-1900. The sandstone for the same year (nearly two-thirds being bluestone) was valued at \$1,467,496—also the largest value attained from 1890 to 1900. The annual production of granite and of marble each ranges in value from about \$200,000 to \$500,000. Slate is of less importance. New York produces over half of the total output of rock cement for the country, the value for 1900 being \$2,045,451. Portland cement is also made. The value of the clay products for 1900 was \$8,073,769—a little less than in 1890—of which over one-sixth represented pottery, and the remainder brick and tile. New York is the largest salt-producing State, the value of the product being over one-third that for the entire country. Prior to 1893 New York was exceeded by Michigan in the salt output, but it has regularly held first rank since that year. Since 1898 the annual value has been more than \$2,000,000. The yield of the different kinds of iron ore in 1900 was: red hematite, 44,467 long tons; brown hematite, 44,891; magnetite, 345,714; and carbonate, 6413 long tons, the value of the entire product being \$1,103,817. Petroleum and natural gas are obtained in the western part of the State. The value of the natural gas yield was greatest in 1890—\$552,000. The highest subsequent figure was that for 1900—\$363,367. Only one State, Wisconsin, exceeds New York in the value of its mineral waters, the total receipts being \$929,038, from 44 springs reporting in 1900.

FISHERIES. The fishery industries, like those of most of the Middle Atlantic coast States, have greatly declined in value of late. Its vessel fisheries, however, show an increase. In 1898 there were 9185 persons engaged in the industries, as against 12,246 in 1891. The value of the catch for the same year was \$3,545,189, showing a decline of nearly 30 per cent. since 1891, although the amount of the catch increased during the same period. Suffolk County, on Long Island, is the foremost county in the State in fisheries. The oyster represents more than one-half of the total value. Next come menhaden, bluefish, and clams. In the counties bordering on the Hudson the fisheries are of minor importance. The chief species here are shad and alewives. The lake fisheries of New York are also of some importance. The menhaden industry has been considerably consolidated in late years. Its product in 1898 was \$405,488. The value of the canned fish amounted in 1900 to \$197,869. See the bibliography under the article FISHERIES.

AGRICULTURE. For a long time New York was the first State in agricultural importance, and as late as 1890 was surpassed by Illinois alone in the value of farm products. In 1900, although these products had increased 51 per cent. in the decade ending with that year, the amount was

COPYRIGHT, 1891 AND 1908, BY DODD, MEAD & COMPANY

exceeded in three Western States. Each decade since 1870 has witnessed a decrease in the value of farm land and farm improvements, a fact generally explained by the rise of Western competition. The area of improved land reached its maximum in New York in 1880, and declined in each of the subsequent decades. In 1900 74.3 per cent. of the land area of the State was included in farms, and of this amount 68.9 per cent. was improved. The average size of farms decreased from 112.1 acres in 1850 to 99.9 acres in 1900. Tenant farming is growing in favor, and embraced in 1900 23.9 per cent. of all farms. Over one-half of the total crop acreage is devoted to hay and forage, and exceeds the corresponding area in any other State. The importance of the dairy industry gives a special value to hay. While the total product is sometimes exceeded in other States, it generally stands first as to total value. Oats is the most important cereal and is a favorite crop in the Saint Lawrence Valley. Wheat and corn are of about equal prominence. Both regained from 1890 to 1900 a part of the very large loss of area which characterized them in the preceding decade. Only one other State rivals New York in the production of rye and buckwheat.

After hay, the potato is the most valuable farm product. The State is unapproached in the area devoted to this vegetable, and in the value of its production. New York also takes first rank in garden farming. Long Island is almost wholly devoted to this industry, for which it has the special advantage of being near to the New York market. In the production of beans the State holds second rank. In the western counties north of the watershed and in Ulster County are large fruit orchards, the apple trees constituting 70 per cent. of the total number of fruit trees in the State. Grapes are grown abundantly in the southern part of the Hudson Valley and in the lake region. Tobacco is raised in the Chemung Valley and northeastward to the eastern end of Lake Erie. Hops are a prominent crop in some of the central counties, but recently there has been a significant decrease, owing to Western competition. A large income is annually obtained from the products of floriculture. Fertilizers are very commonly used throughout the State, an average of \$20 per farm being expended for them. The following table of acreages explains itself:

CROP	1900	1890
Hay.....	5,154,965	5,243,010
Oats.....	1,329,753	1,417,371
Corn.....	658,654	493,320
Wheat.....	557,736	467,561
Buckwheat.....	289,862	280,029
Rye.....	177,416	236,674
Barley.....	111,658	349,311
Potatoes.....	395,640	357,464
Beans.....	129,296	

STOCK-RAISING. Stock-raising is characterized by the great prominence of dairy cows. The number of cows has increased steadily, and the dairy industry has likewise grown. In 1900 the value of dairy products constituted 30.5 per cent. of the gross farm income. The receipts from the sales of milk in that year were \$36,248,833, and from sales of butter, \$9,868,446. From 1890 to 1900 there was a decided increase in the number of cattle and a marked decrease in the number of sheep. Poultry products are a very

prominent item. The following table of the holdings of stock is self-explanatory:

	1900	1890
Dairy cows.....	1,501,608	1,440,230
Other cattle.....	1,094,781	691,162
Horses.....	628,438	664,430
Mules and asses.....	3,651	4,636
Sheep.....	964,516	1,528,976
Swine.....	676,639	843,342

FORESTS AND FOREST PRODUCTS. Forests of white pine, spruce, and hemlock originally covered the Adirondacks, and, mingled with hard woods, were common throughout other parts of the State. New York has long played a prominent part in the lumber industry of the country, and in 1850 ranked first among the States in the value of timber products. As a result the merchantable timber has been generally removed except in the Adirondacks, and most of the pine has been cleared from that region. The State possesses here 1,163,414 acres. In 1900 there were in New York 705,914 acres in private reserves, and 1,356,816 acres were owned by individuals or companies for other purposes. Hemlock and spruce are cut in the largest quantities. From the table below it will be seen that while the value of the lumber and timber products, as also the planing mill products, etc., decreased somewhat during the decade, the value of paper and wood pulp increased 88.2 per cent. This gave the State first rank in this industry.

MANUFACTURES. The leading position of New York as a manufacturing State dates from about 1825, when the Erie Canal was finished. The largest absolute gain in the industry was made from 1880 to 1890. The percentage of the population engaged in the industry as wage-earners increased from 6.4 in 1850 to 11.7 in 1900. There was, however, a decrease in the last decade of that period. The total value of manufactures for the year 1900 was \$2,175,726,900. This figure was one-seventh greater than that for Pennsylvania—the only other State which approaches New York in this respect. The figure was in fact nearly one-sixth of that for the United States. This position is held by the State despite the comparative lack of iron manufacturing and textile industries. It is due to the great number of factories and shops producing the more highly finished products. The State is not without valuable resources of field, forest, and mine, and counts also among its advantages the sources of an abundant water-power, including the Niagara Falls. But its advanced position is the outgrowth rather of its superior situation with respect to both home and foreign markets. The construction of the Erie Canal westward through the Mohawk Valley—the only natural break in the Appalachian Mountain range—established early communication between the Hudson River and the Great Lakes, and brought to New York much of the commerce of the West. The water routes determined the location of nearly all the large towns, which in turn largely determined the location of railway routes. At the southern extremity of this system of water transportation was New York Harbor, with its superior natural facilities for shipping. New York City thus became the metropolis of the country, and extensive manufacturing industries sprang up in and about it. About three-fifths

of the total State output is accredited to New York City, but this output includes many industries of only local concern, such as the manufacture of gas and of bread and other food preparations, carpentering, plumbing, tinsmithing, and masonry work. In the different branches of the clothing and garment industry, New York City and other towns of the State produce more than a third of the output of the United States. The production of men's and women's factory-made clothing is largely confined to the metropolis. The work is generally performed in small workshops or tenement rooms. This system grows out of the necessity for specialization owing to the large number of patterns used, and is favored by the abundance of cheap labor available where there are such large numbers of foreigners unable to secure more profitable employment. This branch of industry is of comparatively recent development. Troy shares with New York in the extensive production of men's furnishing goods—shirts, neckwear, etc. Millinery and lace goods and silk and silk goods are New York City products, the last having suffered a large decline from 1890 to 1900 owing to the removal of establishments, in quest of cheaper rents and certain other advantages, to points outside the State. Yonkers is the centre of a large knitting industry, and Cohoes and Utica are noted for their carpet and rug manufactures. The manufacture of fur goods in New York City, and of boots and shoes at different points, is extensive. Tanning and the manufacture of leather are also very important.

While the iron and steel industry is of comparatively small and decreasing importance, the foundry and machine-shop industry is rapidly developing, and in 1900 gave the State second rank. The printing press and steam engine are the best known of these products. The industry is well represented at most of the large centres. New York is unrivaled in the manufacture of electrical apparatus and musical instruments. Especially prominent are the manufactures of refined sugar and molasses, roasted and ground coffee and spice, confectionery, patent medicine, tobacco, and liquors—most of which are produced almost wholly in New York City. Flour and grist-milling, slaughtering and meat-packing, and the factory production of cheese, butter, and condensed milk, are more generally distributed over the State. In the first-named industry the State ranks second. On the opening of the Erie Canal, Rochester, being favored with water power from the falls of the Genesee River, became the leading 'flour city' of the United States, and New York held first place until the comparatively recent development of the industry at Minneapolis. Between 1890 and 1900 both the flouring and slaughtering industries declined. The

factory production of cheese, butter, and condensed milk, on the contrary, increased during that period nearly 85 per cent., and the State continues to hold first rank in this line. The manufacture of chemicals, including paints and varnishes, has attained large proportions in New York City. The printing industry of New York is more than twice that of any other State, and the metropolis is the centre of the periodical press as well as of book publishing. New York has long ranked as one of the foremost States in the brewing industry. The preceding table is a summary for the leading industries.

COMMERCE AND TRANSPORTATION. In maritime commerce New York far outranks any other State in the Union. In the fiscal year ending June 30, 1901, 64 per cent. of the imports and 35.60 per cent. of the exports of the entire nation passed through the port of New York. Its traffic to and from other United States coast points is between two and three times the volume of its foreign trade. In addition it has a vast trade along the Hudson. Buffalo is the chief lake port of the State, and has an immense commerce with the West. With this commerce may be included that of Tonawanda. Oswego is the principal port on Lake Ontario. Other important shipping points are: Charlotte, Sodus Point, Fair Haven, and Cape Vincent on Lake Ontario, Ogdensburg on the Saint Lawrence River, Rouses Point, Plattsburg, and Whitehall on Lake Champlain, and Newburgh and Rondout on the Hudson River. The total traffic for the entire State can best be noted in connection with the means of inland transportation.

New York was the first State to enter actively on the work of canal construction. In addition to the Erie Canal, opened in 1825, the State has constructed the Champlain Canal, the Oswego Canal, and several other branch canals, and enlarged the Erie Canal to four times its original dimensions. The total expenditure on canal construction has been nearly \$100,000,000. In recent years, owing to railroad competition and the neglect of the State to improve the canals, the traffic on them has declined, most of the branch canals have been abandoned, and only on the Erie and Champlain routes is there any considerable tonnage. Proposed plans for the enlargement of the Erie Canal constitute a most important question for the State.

The first railroad in the State was the Mohawk and Hudson, opened in 1831 from Albany to Schenectady, a distance of seventeen miles. By 1842 there were lines extending from Albany to Buffalo. Within another decade the Erie road across the southern part of the State and the Hudson River road from New York to Albany had been completed. Since then roads have been built over every section of the State, and the

different lines have been united into great systems. There were, in 1900, 8095 miles of road and over 12,000 miles of track in the State. The total traffic in 1899 was 150,000,000 passengers, moved 3,500,000,000 passenger miles, and 170,000,000 tons of freight, moved 24,000,000,000 ton-miles—being one-fourth of the passenger traffic and one-fifth of the freight traffic of the entire country. The principal railroad systems crossing the State are the New York Central and Hudson River, the Erie, the Lackawanna, the New York, Chicago and Saint Louis (with the West Shore), the New York, Ontario and Western, and the Lehigh Valley. Other important systems enter at the east and west. There is a State board of railroad commissioners, having general supervision of railroads and their operation with reference to public safety and convenience. The board is empowered to investigate and report violations of the law.

BANKS. The paramount position of New York City in the American financial world places New York State in the lead among the States in the number and resources of its financial institutions. The first bank of the State was the Bank of North America, incorporated in 1782. In 1791 the second bank was chartered under the name of the Bank of New York. In 1804 an act was passed prohibiting banking and the issuing of currency in the State except under a special charter from the Legislature. Due to the high profits, banking charters were eagerly sought and became political favors. At the time of the declaration of war with Great Britain in 1812 there were twenty banks in the State, and twenty-four more were chartered between 1812 and 1829. As the bank charters were for a limited number of years, and most of them were to expire in 1831, the banks in 1828 made a combined effort for a general renewal of their charters. But a strong opposition developed to this plan. The careless distribution of charters to political friends had produced bad results, and the New York currency was becoming less secure. A reform of the banking system was therefore undertaken in 1829, and the plan of securing bank circulation by the formation of a safety fund was successfully carried through. The law required all banks with new or renewed charters to contribute one-half of one per cent. of their capital annually to a common safety fund, out of which losses from bank failures were to be covered. A board of three bank commissioners was created by the same bill, and quarterly examinations and annual reports pro-

vided for. In 1832 fifty-two banks were members of the safety fund, and twelve did not belong to it. The financial crisis of 1837 was heavily felt in New York, where the banks suspended specie payments, and bills of many concerns passed at a discount. The chartered banks became the object of popular dissatisfaction, which expressed itself in a demand for a free banking system. As a result of this agitation a free banking law was passed in 1838, which, in order to secure the bank currency, compelled the investment of the bank capital in New York State bonds or equally good securities and their deposit with the State. This was the plan afterwards adopted by the Federal Government in the national banking system. For some time both systems of banking worked side by side, notwithstanding a great deal of friction. For twelve years (1829-41) this safety fund was not drawn upon, as no chartered bank failed during that time. But the failure of six banks in 1841 so exhausted the fund that a law was passed in 1842 limiting the guarantee to circulation only, and not to all the liabilities of the failing banks. As the charters of the chartered safety fund banks expired, most of them reorganized under the free banking law. This was amended in 1840 by limiting the deposits to New York State bonds, as many of the other securities deposited had proved worthless. In the many bank failures during the crisis of 1841, this system of deposits proved its value, preventing serious losses on circulation.

In the severe financial crisis of 1857 this system was again put to a severe test, but notwithstanding a general suspension of specie payment for some time, the banks remained firm. At the time of the introduction of the national banking system the New York banking was not only the greatest, but also the most secure in the country. The new system was therefore not welcomed, and specially heavy taxes were imposed on the national banks. These taxes were, however, declared unconstitutional by the Federal courts. The State banks were forced to obtain national charters, and from 309 in 1863 the number of State banks was reduced to 45 in 1868. After that their number increased but slowly until 1880 (70), when a steady increase began. Since 1894 capital has preferred the new form of organization known as trust companies, which, while doing a general banking business, are yet different enough to have a more favorable system of taxation. Savings banks have existed in the State since 1819, and their number grew rapidly, especially after the Civil War, increasing from 71 in 1863 to 150 in 1873. Though since then their number has gradually diminished, the amount of deposits has increased immensely. See article on BANK, BANKING.

The condition of the banks in New York State in 1902 is shown as follows:

	National banks	State banks	Private banks	Trust companies	Savings banks
Number	352	193	14	70	127
Capital.....	\$126,068,000	\$25,515,000	\$223,000	\$53,225,000	\$.....
Surplus.....	80,643,000	17,326,000	73,000	70,887,000	115,540,000
Cash, etc.....	199,777,000	75,396,000	191,000	10,481,000	9,339,000
Deposits.....	785,921,000	253,412,000	2,611,000	881,001,000	1,061,689,000

vided for. In 1832 fifty-two banks were members of the safety fund, and twelve did not belong to it.

The financial crisis of 1837 was heavily felt in New York, where the banks suspended specie payments, and bills of many concerns passed at a discount. The chartered banks became the

The system of clearing houses originated in New York City. The total exchanges for the first year (1854) were more than five and a half billions, and in 1900 more than sixty billion dollars. Consolidation has latterly become a prominent feature of the banking business of New York, about thirty small banks having been bought out.

by larger institutions, and in many instances becoming local branches of the same. The largest financial transactions all over the country mostly emanate from New York, and, besides, New York City remains the main channel for all financial transactions between the Old and New Worlds. The New York clearing house is therefore the clearing house for the whole nation. The New York money market regulates the country's money markets, and is beginning to assert a dominant influence upon the European world. Many foreign loans have been floated in New York during the last few years, and many foreign securities listed on the New York exchange. The greatest industrial and railroad consolidations between 1890 and 1900, though chartered in New Jersey and Delaware, and uniting property located in various parts of the Union, are nevertheless all creatures of 'Wall Street'—as the New York financial world has come to be known.

FINANCE. At the close of the Revolutionary War the State, by the sale of public lands, formed a general fund, the revenues of which were to defray the expenses of government, and for some time this was actually accomplished. Another fund was established for school purposes. In 1814 the State even paid out of this fund the direct tax levied by the National Government. A State tax became necessary after that, but was discontinued in 1826. In 1817 the State entered upon the system of public improvements, mainly canal construction, and a public debt of more than \$7,000,000 was created for that purpose. At the same time a sinking fund was organized, and the tolls of the canals, as well as the salt duties, were assigned to it so as to prevent financial difficulties. After the construction of the main Erie Canal, other lateral canals were undertaken, which increased the public debt. In 1827 the State entered upon a new policy of lending its credit to private companies for public improvements, and \$5,228,700 was loaned to ten companies, chiefly railroads. Some of them failed, the most important one being the Erie Railroad (in 1842). Their indebtedness (\$3,665,000) became a burden upon the State fund. The total debt then amounted to more than \$20,000,000, and the State was threatened with insolvency. A new course was therefore adopted in 1842. All expenditures upon public works were stopped, outstanding debts funded, and a tax imposed to meet the expenses of government and the payment of interest. The new Constitution of 1846 provided for a special canal sinking fund and a general sinking fund, and prohibited the creation of a new indebtedness except for war purposes, and even then only after popular sanction by a referendum. This last provision has been preserved in the present Constitution. Under these strict regulations the bounty State debt of \$30,000,000 was created in 1865 to meet the expenses of the Civil War, and at that time the State debt reached its maximum of \$53,000,000. After that the debt was rapidly reduced by means of the sinking fund. In 1870 it was only \$32,400,000; in 1880, \$8,988,000. The year 1893 saw the total extinction of the debt.

But a public debt was again created toward the year 1900 for purposes of canal improvement. After 1842 the main source of the State income was a direct tax upon all assessable property. Between 1890 and 1900 other sources, such as licenses, fees from foreign corporations, etc.,

became more important, and at the end of the nineteenth century several energetic efforts were made to separate the sources of State and local taxation. New taxes were laid upon banks, trust companies, public franchises of corporations. Further efforts in the same direction were made in 1902. On January 1, 1903, the debt of the State amounted to \$10,000,000. The aggregate receipts of the ten funds for which separate accounts are kept were \$27,049,558, or, subtracting transfers from one fund to the other, \$24,042,462. The main sources of income were a State tax for general and for school purposes, 29 per cent.; inheritance tax, 14 per cent.; excise tax, 17½ per cent.; and corporation tax, 25½ per cent. The expenditures were \$26,609,055, or, excluding transfers, \$23,601,959, leaving a surplus of \$440,503. Balance in treasury (1903), \$6,992,599.

GOVERNMENT AND ADMINISTRATION. The last revision of the Constitution took place in 1894, and on being approved by the vote of the people of the State went into force on January 1, 1895. It provides for a census in 1905 and every tenth year thereafter. It permits of amendments if passed in two consecutive Legislatures by a majority of each House, and adopted by a vote of the people. It provides for the submission to the people of the question of a constitutional convention every twenty years, or oftener if ordered by the Legislature. A voter in New York must have been a citizen of the United States ninety days, a resident of the State one year, of the county four months, and of the town or precinct thirty days. The registration of voters is required, but such registration cannot be required for town and village elections except by express provision of law. The holding of party primaries in the cities is regulated by statute. The Legislature consists of a Senate of 50 members, chosen for two years, and an Assembly of 150 members, chosen annually. Of the latter, sixty are elected in New York City. The Assembly districts are single-member districts. Each county, except Fulton and Herkimer, has at least one representative. The more populous counties are formed into Assembly districts, but county lines are not crossed. The members of either House receive a salary of \$1500 and mileage. The capital of the State is Albany.

EXECUTIVE. The Governor is elected for two years. He has the right to veto legislative measures, including items in appropriation bills, but his veto may be over-ridden by two-thirds of the members of each branch of the Legislature. He has the power to pardon; he may remove certain State and local officers; and with the consent of the Senate he makes appointments to a number of positions. With the Governor there are elected for the same term a Lieutenant-Governor (who is president of the Senate), a Secretary of State, a Comptroller, a Treasurer, an Attorney-General, and a State Engineer and Surveyor. The most important appointive officers are the superintendent of public works (who has charge of the State canals), and in addition the superintendents of banking, of insurance, and of State prisons; also a commissioner of labor statistics, a factory inspector, an excise commissioner, and a commissioner of agriculture. There are boards or commissions, also appointed, for charities, health, lunacy,

railroads, tax equalization, quarantine, forestry, etc.

JUDICIAL. The highest court in the State is the Court of Appeals, composed of a Chief Justice and six associate justices, elected singly for terms of fourteen years. The Supreme Court is composed of seventy-six judges, each elected for fourteen years. They act in eight judicial districts. There are also county courts, surrogates' courts, and city courts.

LOCAL GOVERNMENT. The Legislature provides for the organization of cities and incorporated villages, and restricts their power of taxation assessment, borrowing money, contracting debts, etc., "so as to prevent abuses. . . ." It divides all cities into three classes, according to size, and provides that all special legislation shall be submitted for the approval of the cities concerned, although they may be passed later over the city's veto. In the counties, the board of supervisors, elected by towns and wards of cities, have control of public buildings and the care of the poor, and they audit the accounts of county officers. The cities are governed under special charters, varying in their provisions.

Since 1848 married women have had separate rights to real and personal property in New York State. They may carry on business, and may sue or be sued on their own account. A husband may convey directly to his wife, and a wife to her husband. Absolute divorce is granted only for adultery. Women may practice law. No youth under eighteen and no woman under twenty-one may be employed in a factory for more than 60 hours in one week, nor may any child under thirteen be so employed at all.

MILITIA. In 1900 there were 1,639,395 men of militia age. The militia in 1901 numbered 14,410.

POPULATION. The population of the State by decades has been as follows: 1790, 340,120; 1800, 589,051; 1810, 959,049; 1820, 1,372,111; 1830, 1,918,608; 1840, 2,428,921; 1850, 3,097,394; 1860, 3,880,735; 1870, 4,382,759; 1880, 5,082,871; 1890, 5,997,853; 1900, 7,268,012. From fifth rank in 1790 the State advanced to first place in 1820, and has ever since held this position. The largest absolute increase and the largest per cent. of increase after 1860 were witnessed from 1890 to 1900. In that decade the rate of increase was slightly greater than that for the United States, being 21.2 per cent., as against 20.7 per cent. The growth during that time, however, was wholly on the part of the urban population. In 1900 the 83 cities of the State with a population of over 4000 each contained together 71.2 per cent. of the total population, only two other States having a higher per cent. of urban population. The large urban population accounts for the high average density per mile—152.6. This figure is exceeded in only three States.

The location of New York City, as the gateway to the large foreign immigration to the United States, has resulted in giving the metropolis an unusually large foreign element. In 1900 the foreign-born in the State numbered 1,900,425—nearly twice as many as in any other State. The striking characteristic of the foreign element in New York as compared with the country in general is the prominence of the Irish, Jews, and Italians. The State contains nearly four times as many Irish as any other State except Massachusetts; nearly three times as many Italians;

and nearly as many Jews as all the rest of the country combined. Of the native white population, those born of foreign parents numbered 2,415,845 in 1900. There were 99,232 negroes, 7170 Chinese, and 5257 Indians. The female sex slightly outnumbers the male.

CITIES. The population of the 12 largest cities in 1900 was: New York, 3,437,202; Buffalo, 352,387; Rochester, 162,608; Syracuse, 108,374; Albany, 94,151; Troy, 60,651; Utica, 56,383; Yonkers, 47,931; Binghamton, 39,647; Schenectady, 31,682; Auburn, 30,345. The State sends 37 members to the National House of Representatives.

RELIGION. The large immigration into New York has resulted in a very rapid increase of the Catholic and the Jewish populations. Particularly in New York City have these two elements become prominent. Among the Protestant denominations the Methodists are the most numerous, followed by the Presbyterians, Baptists, Protestant Episcopalians, Lutherans, and Congregationalists. Protestantism in New York City is characterized by the prominence of the Protestant Episcopal Church, this Church being much stronger there than elsewhere in the Union.

EDUCATION. Several school teachers were brought to New Netherland by the Dutch West India Company, but under the English rule popular education was neglected by the Government. In the eighteenth century several private academies were established, and in 1754 King's College was founded, and was reorganized in 1784 as Columbia College. At the latter date the Regents of the University were constituted a supervisory authority over higher education. The first step toward public common schools was taken in 1789, when two lots of land were assigned to each township for gospel and school purposes. But it was not until 1812 that an active movement set in to establish a State system. In 1854 a State Department of Public Instruction was organized, and soon afterwards the plan of free common schools was adopted, and State taxes for schools were very largely increased. The various schools are under the immediate direction of district trustees, and of boards of education in the towns and cities. The State superintendent exercises a general supervision over the common schools. The Regents of the University, a board of nineteen members elected for life, with four State officers *ex-officio*, continue to supervise secondary education. This board incorporates all higher institutions, distributes the State grants to academies and high schools, and for this purpose conducts a system of secondary school examinations and certificates which embraces this phase of public education throughout the State.

School attendance is compulsory between the ages of eight and sixteen years. The illiterate population of the State is 5.5 per cent. of the total population of ten years of age and over. The proportion of illiterates is 1.2 per cent. for native white, 14 per cent. for foreign white (12.5 in 1880), and 12.8 per cent. for colored. According to the school census of 1901 the school age (five to eighteen) population of the State was 1,620,287, of whom 1,242,416 were enrolled in the public schools in the same year. The average attendance in 1901 was 873,157, as against 642,984 in 1890. There were 35,591 teachers employed in the public schools of the State in 1901, of whom

5147 were males. The percentage of male teachers has shown a constant decrease since 1880, when it amounted to 26 per cent. The total school revenue was \$38,469,277 in 1901, of which \$26,451,363 was derived from local taxes, \$3,500,000 from State taxes, \$272,477 from the permanent school fund, and \$8,245,437 from other sources. The expenditure per pupil of average attendance in 1901 was \$41.68—the highest expenditure of any State in the Union. Normal education is provided by 16 public normal schools which had 5426 students in 1901. The State maintained in 1901 383 high schools, with 63,549 students. There were besides 199 private high schools and academies, with an attendance of about 11,000.

The most important as well as the oldest university is Columbia, in New York City. There is no State university, but Cornell University, in Ithaca, awards certain State scholarships on examinations. The other important institutions are Union College, in Schenectady; New York University, New York City; Hamilton College, Clinton; universities at Syracuse, Rochester, and Buffalo; Colgate University, Hamilton; Hobart College, Geneva; the Catholic colleges of Manhattan, Saint Francis Xavier, and Saint John's, all in New York City; and the College of the City of New York. Vassar College, at Poughkeepsie, and Barnard College, now part of Columbia University, are two of the leading women's colleges in the country. Among the fifteen theological seminaries the most noted is the Union, in New York City. There are seven law schools, twelve medical schools, three dental, and four schools of pharmacy. In each of these professions there are systems of State examinations required of all who wish to practice in New York. The New York Society Library, founded in 1700, claims to be the first in the State. In 1838 the Legislature set aside part of the income from the United States deposit fund for the establishment of a district library system, and this State aid is now distributed by the Regents of the University.

CHARITABLE AND PENAL INSTITUTIONS. The State boards of charities, lunacy, and corrections are each appointed by the Governor and Senate. The board of charities exercises an advisory supervision over the State and local charitable institutions and private institutions to which public charges are committed. It visits and inspects over 500 institutions, containing more than 60,000 inmates. A law of 1902 provides for the appointment by the Governor and Senate of a fiscal supervisor of State charities; and another law of the same year provides that the Governor, the president of the State Board of Charities, and the State Comptroller act as a commission to approve plans, specifications, and contracts for the construction of State institutions. These include an industrial school at Rochester, an asylum for feeble-minded children at Syracuse, one for feeble-minded women at Newark, a custodial asylum at Rome, an asylum for orphan Indian children at Iroquois, houses of refuge at Hudson and Albion, reformatory for women at Bedford, Craig colony for epileptics at Sonyea, women's relief corps home at Oxford, soldiers' and sailors' home at Bath, school for the blind at Batavia, hospital for crippled and deformed children at Tarrytown, and a hospital for the treatment of incipient pulmonary tuberculosis at

Raybrook. There are a number of private institutions which receive State appropriations. A total of 15,780 persons were supported in the county almshouses during the year ending October 1, 1900, and also over 70,000 were supported at the city and town almshouses. In addition more than 209,000 persons received temporary relief during that period. The various institutions under the supervision of the board expended \$16,107,000 during the year ending September 30, 1900.

The board of lunacy has supervision over the State insane hospitals. These are located at Utica, Poughkeepsie, Middletown, Buffalo, Willard, Binghamton, Ogdensburg, Rochester, Wards Island, Kings Park, L. I., Flatbush, L. I., Gowanda, Matteawan, and Dannemora. In 1900 their inmates numbered 23,267. There are also 20 institutions and private houses authorized to receive the insane. These had in the same year 934 patients. The maintenance of the State insane hospitals for the year ending September 30, 1900, cost \$3,594,873, or \$164.79 per patient. The State penitentiaries are county institutions, of which there are six, located respectively in the counties of New York, Kings, Erie, Albany, Monroe, and Clinton. These receive short-term convicts committed for minor offenses. Counties not having penitentiaries of their own send this class of convicts by contract to the penitentiary of some other county. Convicts sentenced for terms exceeding one year are sent to the State prisons at Ossining (Sing Sing), Auburn, and Clinton, or to the reformatories at Elmira and Napanock, and to the one for women at Bedford. There are also houses of refuge for women at Hudson and Albion. The total prison population in 1902, including that of county jails, the New York City prisons, and workhouses, was 96,932, as against 149,677 in 1898. The more frequent application of the law of suspended sentence and the abolition of the fee system in the various counties are thought to have been largely responsible for this decrease. The Elmira Reformatory has acquired a widespread reputation because of its system of instruction and training. The prisoners committed to it have the advantage of an indeterminate sentence and a parole law. In New York, since 1888, death by electricity has been substituted for hanging as the penalty for murder.

HISTORY.

New York Bay was discovered by Verrazano in 1524, but though Portuguese, French, and Spanish navigators, in all probability, visited the harbor during the sixteenth century, no important explorations were made before 1609, when almost simultaneously Samuel de Champlain, the founder of Quebec, in August, and Henry Hudson, sailing in the *Half Moon* under the Dutch flag, in September, entered the limits of the present State. Champlain's action in lending the Huron Indians aid against the Iroquois imbued the Five Nations with an implacable hatred for the French, and to a great extent determined in advance the fate of their colonizing schemes in America. Hudson's account of New Netherland, as he named the region, and of the great river, called at first Mauritius and then North, and finally Hudson, which he had ascended to the highest navigable point, led Dutch merchants, eager for furs, to dispatch trading vessels to the new

country in 1610 and subsequent years. Just below Albany, Captain Christensen built Fort Nassau in 1613 (abandoned in 1617), and about the same time a number of traders built their posts on Manhattan Island. A trading company, organized in 1615, concluded two years later at Tawasanth, near Albany, a treaty with the Iroquois, who remained to the last friends of the Dutch. With the founding of the West India Company in 1621 a fairly active immigration began. A number of Walloons brought over by Captain May in 1623 were settled on Manhattan Island, on Long Island, and up the Hudson at Fort Orange (later Albany), founded in 1622. In 1626 Peter Minuit was made director-general of the company, and bought Manhattan Island from the Indians. (See NEW YORK CITY, section on *History*.) The greater part of the population of New Netherland, 200 in number in 1625, were agents of the company, whose object in the main was trade and not colonization; and as it guarded its monopoly jealously and offered few inducements to permanent settlers, progress for a few years was slow. Quickly, however, individual directors discovered the advantageous facility with which the Indians might be brought to part with their lands, and in 1629 the patroon system, a system of feudal tenure on an extensive scale, was established. Kilian Van Rensselaer purchased a large tract of land in the neighborhood of Albany, and Michael Pauw bought Staten Island and Pavonia. Ships from Holland stocked these great estates with colonists, tools, and animals. The acquisition of land continued under Wouter Van Twiller (q.v.), who came over in 1633, and under Kieft (q.v.), who succeeded Van Twiller in 1638. The abandonment of the company's trade monopoly was followed by a large influx of colonists, among whom were many English Puritans and French Huguenots. The population was cosmopolitan even in 1643, when, according to Father Jogues, 400 or 500 inhabitants spoke eighteen different languages and were divided into Calvinists, Lutherans, Catholics, Puritans, Baptists, and other more minute denominations. Wars with the Algonquin Indians, caused by the greed of Kieft, brought the colony near to destruction. The settlements around New Amsterdam were wiped out and the town itself was threatened. In the moment of highest danger Kieft was forced by popular demand to appoint a council of eight to assist him in carrying on the war. This was the beginning of representative government in New York. Peter Stuyvesant (1647-64) appointed a council of nine to advise him and acted in systematic opposition to it. Sincerely solicitous for the welfare of the colony, he reserved it for himself to determine in what that welfare consisted and how it was to be attained. Defying alike the popular will and the orders of the States-General in Holland, he ruled, arrested, confiscated, silenced public speech, and dictated the outline for the Sunday sermon. New Amsterdam received a burgher government in 1653, but Stuyvesant had the appointment of the magistrates. He upheld bravely the rights of the company against the Swedes on the Delaware, whom he dispossessed, and the English in Connecticut and Long Island, but the citizens grew weary of him and yielded in 1664 to an English fleet under Colonel Nicolls, which had come to enforce the Duke of York's title to the region.

New Netherland became New York, and was ruled by the Duke's Governors (a Legislature was refused), and the 'Duke's laws.' Taken by the Dutch in 1673, it was returned to England in the following year. At the time of the English occupation New Netherland had a population of about 8000, comprising many nationalities, with the Dutch predominant. Life in the colony had not that deep spiritual tinge which it bore in New England, but it was more gracious and more free. The churches were well supported, and the school system was excellent, but breweries and drinking-shops found their place in the order of things. In religion a broad toleration, in social life a hearty gayety and timely hospitality marked this cosmopolitan colony of well-fed traders and farmers.

The Dutch did not take kindly to the English rule in the beginning. The desire of the people for some share in the government remained unsatisfied. Complaints against the arbitrary imposition of taxes and customs culminated in a demand, expressed in the form of petitions, for a popular assembly, and this was finally granted in 1683, when a provincial assembly summoned by Governor Dongan passed the Charter of Liberties, granting freedom of religion to all Christians, and the suffrage to all freeholders. An important treaty with the Iroquois in 1684 confirmed the alliance between them and the English and made them definitely the enemies of the French, who retaliated with punitive expeditions into the country, in 1687 under Denonville, and later, repeatedly, under Frontenac. In 1686 New York and Albany obtained new charters, but in the following year the provincial assembly was dissolved, absolute rule was restored, and New York became a part of the Dominion of New England, under Governor Andros. The Revolution of 1688 in England found two parties in the colony, the richer classes who were loyal to James II., the popular majority in favor of William of Orange. Exaggerated reports of Catholic intrigues caused Jacob Leisler (q.v.) to seize the fort at New Amsterdam in the name of William and Mary. A committee of safety made him commander-in-chief, and the popular assembly in 1689 gave him autocratic power. He held the fort against a force of troops from England, but willingly laid down his authority when Governor Sloughter, the King's appointee, arrived. The clergy and the wealthy merchants hated Leisler as the champion of popular ideas, and brought about his death on a charge of treason in 1691.

The period from 1690 to the Revolution was marked by almost continuous disputes between the Governor and the Assembly on the questions of the Governor's salary, the collection and the disposal of the revenue, the control of the courts, and the establishment of an endowed Church. Of the Governors the larger number were impetuous peers sent to America to grow fat as best they might. They bargained with the Assembly for an increase in salary, participated in gigantic land frauds in common with minor officials and prominent citizens, and in one instance, the notable case of Governor Fletcher (1692-98), shared in the profits of piracy. There were, however, Governors of a far higher character, men like Bellomont (1698-1701), to whom the rehabilitation of Leisler's memory is due, Robert Hunter (1710-19), or William Burnet (1720-28), who was an ardent champion of the royal power, but nevertheless an honest man.

and zealous for the welfare of the province. But in spite of political turmoil the growth of the colony was rapid and uninterrupted. In 1720 the population consisted of 31,000 whites and 4000 negroes; in 1756 it comprised 83,000 whites and 13,000 negroes, and in 1771 168,000 whites and negroes. The first newspaper, the *Gazette*, a Government organ, was published in 1725, and the second, the *Weekly Journal*, an opposition sheet, appeared in 1733. For his criticism of the Governor's conduct the editor of the *Weekly Journal*, John Peter Zenger (q.v.), was brought to trial for libel in 1734, but, supported by the people and the Assembly, he won his case and vindicated the freedom of the press in New York. In 1746 the Assembly appropriated £250 toward the foundation of King's College. The people who fought for the freedom of the press and established King's College were the same who in 1741, thrown into a paroxysm of fear by the baseless rumors of a negro insurrection, murdered 31 negroes and drove out 71 others by due process of the law. In the early French and Indian wars New York suffered heavily, for, owing to the factious disputes between the Governor and the Assembly, the border was left without any troops and the frontier settlements were swept clean by the French and their Indian allies. In 1690 Schenectady was destroyed. Sir William Johnson kept the Iroquois friendly to the English, and the alliance with them was strengthened at the Albany Convention of 1754 (q.v.). By the Treaty of Fort Stanwix in 1768 a definite line of delimitation between the English and the Indian territory was traced.

As early as 1762 petitions and remonstrances against the oppressive commercial laws had been submitted to Parliament and the King. In 1764 the Assembly appointed a committee to correspond with the other provinces concerning the common cause, and in October, 1765, a colonial Congress assembled at New York. The imposition of the stamp duty was followed by the outbreak of disorder, in which the Sons of Liberty (q.v.) were prominent, and non-importation agreements were entered into by the people. Though the commercial interests of the colony suffered greatly, the Assembly refused to vote supplies for the troops, and on January 18, 1770, the Sons of Liberty and the British soldiers fought the battle of Golden Hill on John Street in the city of New York. There was peace till 1773, when the arrival of tea ships aroused the Sons of Liberty to renewed activity. By 1775 the Provincial Assembly had become devotedly Tory, and unrepresentative of popular opinion. Its last session occurred on April 3d. On April 20th a Provincial Congress, comprising representatives of seven counties outside of New York City, met at New York, and elected delegates to the Continental Congress. Upon the news of the battle of Lexington a committee of 100, in which the more conservative element among the revolutionists predominated, took possession of the Government and issued a call for a provincial convention, which assembled July 10, 1776, at White Plains, and subsequently removed to Kingston, where it adjourned April 20, 1777, after drawing up a constitution for the State of New York. For military events during the War of the Revolution, see UNITED STATES.

The Articles of Confederation were ratified in 1778. Two years later New York ceded its pub-

lic lands in the West to Congress, and in 1786 it terminated its dispute with Massachusetts by granting it the right of preëmption to about 6,000,000 acres of land in the western part of the State. Of this vast tract more than 3,500,000 acres came by purchase into the possession of Robert Morris (q.v.), who disposed of a large area, embracing a considerable part of that section of the State, to a number of citizens of Amsterdam, who in 1798 were authorized by the Legislature to hold land within the State. This tract came to be popularly known as the Holland Purchase. Land speculation was entered into on an extensive scale, and the region filled up rapidly with immigrants from New England. The dispute regarding the possession of Vermont, to which New York laid claim, was settled by the erection of an independent State, Vermont being admitted into the Union in 1791. The fear of too strong a central government and the desire to retain possession of its rich custom-house made New York ill-inclined toward the newly framed Federal Constitution. Two of its three delegates withdrew from the Federal convention, and only after ten States had adopted the Constitution did a State convention ratify it, by 30 votes to 27 (July 26, 1788). From the very outset party lines were sharply drawn in the State. The Federalists were led by Alexander Hamilton, John Jay, and General Schuyler. Among the leaders of the various factions of the Republicans were the two Clintons—George, and after him De Witt—the Livingstons, and Aaron Burr. Federalist from 1795 to 1800, the State became Republican after that year, and passed under the domination of De Witt Clinton, who remained in power till 1822 except for a brief period of eclipse between 1815 and 1817. Politics during this period were venal, and personal ambitions determined the attitude of factions. The followers of the ascendent faction were rewarded with the grant of bank charters and valuable franchises, and, favored by the provisions of the Constitution, which gave the power of appointment to office and removal to a council of appointment (in 1821 there were 15,000 offices, military and civil, at its disposal), the spoils system was developed to perfection and was introduced later by Van Buren into national politics. To De Witt Clinton is due the rise of the canal system which brought such prosperity to the State. The project of an Erie Canal had been discussed by Gouverneur Morris in 1777; it was revived by Clinton in 1810, and work on the Erie Canal was begun in 1817 and terminated in 1825. The success of the undertaking brought about Clinton's election to the Governorship in 1824 and 1826, though his political following had really been shattered.

Clinton was succeeded in power by the Albany Regency (q.v.), a group of men headed by Martin Van Buren, Silas Wright, William L. Marcy, and John A. Dix, who made machine politics an exact science. Personal rivalries and short-lived popular movements determined the general course of events. From 1836 to 1842 the anti-Masonic agitation (see ANTI-MASONS), assiduously fanned into life by Thurlow Weed, was powerful enough to decide the outcome of State elections. The anti-rent troubles originating in the grievances of the farmers against their landlords—the successors of the patroons and the great land companies—lasted from 1836 to 1846, when feudal tenure was abolished by the new

Constitution. (See **ANTI-RENTISM**.) The attitude of the Democrats toward such questions as anti-Masonry, State and national banks, and the canal system, was not uniform. Dissensions between the Conservatives (see **HUNKERS**) and the Radicals (see **BARNBURNERS**) enabled the Whigs to carry the State in 1838. After 1840, when the Liberty Party arose, the anti-slavery feeling was strong in the agricultural parts of the State, and in 1848 the Barnburner Democrats, led by Van Buren, broke away to aid in forming the Free-Soil Party. The Whigs and Know-Nothings gained and lost power in swift succession before the Civil War broke out. The mercantile and manufacturing classes in 1860 advocated peace at any price, but the mass of the people were Unionist. The reaction following upon the disasters of the first year and a half of the war put the Democrats into power. In July, 1863, occurred the draft riots in New York City. (See **DRAFT RIOTS IN NEW YORK**.) The war measures of President Lincoln were denounced violently by the State authorities, and the election of 1864 was bitterly fought, the outcome being decided in favor of the Republicans by the votes of the men at the front.

The economic development of New York has continued uninterrupted after the war, and has fully justified its title of the 'Empire State.' Its history, however, has been characterized by much of that corruption which has marked the post-bellum politics of many States. The period in general presents a dead level of partisan rule relieved by occasional spasmodic upheavals of civic virtue. The gubernatorial power, nevertheless, has been repeatedly in the hands of able men, several of whom attained national eminence. From 1863 to 1871 New York City was ruled by the notorious William M. Tweed (q.v.). In 1875, and again in 1899, frauds in connection with the management of the State canals, involving high officials and others, together known as the Canal Ring, were discovered. In the assignment of public contracts much dishonesty was displayed. The State Capitol at Albany and the county court house at New York are monuments of what patient industry may accomplish in the way of nursing a modest estimate into an enormous defalcation. Many attempts, however, were made to remedy political evils by legislation. Laws were passed to check lobbying, to insure honest party primaries, and to reform the civil service. The question of tax reform was an important subject of legislation after 1880, and brought the State into conflict with the powerful railway, gas, and insurance corporations upon the question whether their capital stock and the value of their franchises were subject to taxation or not. The rise of the Labor Party in 1886 was the cause of much important labor legislation. Laws limiting the hours of daily work and protecting women and children in factories and shops were passed in 1892 and subsequently. Much attention has been devoted to the preservation of the Adirondack forests. In 1867 the public schools of the State were made entirely free, and in 1875 primary education was made compulsory.

The Constitution of 1777 was revised in 1821; the councils of revision and appointment were abolished, and the Governor received the veto power. Many offices formerly filled by appointment were made elective, and, in general,

the new Constitution represented a great advance toward democracy. This tendency was continued in the Constitution of 1846, which put an end to feudal tenure in lands, abolished the court of chancery, established a court of appeals, and made all judges of the higher courts elective. By amendments adopted in 1869 (when a new Constitution framed in 1867 was rejected by the people), 1874, and 1882, further reforms in the judiciary were carried out, negro voters were freed from the property qualification hitherto imposed upon them, penalties for bribery and corruption in office were established, and the canals were freed from toll. Of the thirty-four amendments submitted to the people by the Constitutional Convention of 1894, the most important among those adopted were concerned with the reform of the judiciary, the shortening of the Governor's term to two years, and the reapportionment of the legislative districts of the State.

New York is an uncertain State both in national and State elections, and the influence exerted by its large electoral vote on the outcome of Presidential contests has given it the well-earned name of the 'pivotal State.' Notable cases were the elections of 1844, 1848, and 1884. In the Presidential election of 1844 James K. Polk, the Democratic candidate, received 170 votes in the electoral college as against 105 votes cast for Henry Clay, the Whig candidate. The 36 electoral votes of New York, which Polk carried by a small plurality, were sufficient to decide the election. In 1848 the dissensions in the Democratic Party in the State enabled Taylor to secure the Presidency. In 1884 Cleveland, the Democratic candidate, carried the State by a plurality of 1149 and secured the Presidency. New York voted for the Republican candidates from 1796 to 1808. In 1812 it cast its vote for De Witt Clinton, who had been nominated by the section of the Republican Party opposed to the domination of the Congressional caucus, and had been indorsed by the Federalists. It voted for Monroe in 1816 and 1820, divided its vote among Adams, Crawford, Clay, and Jackson in 1824 (26 out of 36 for Adams), and between Adams and Jackson in 1828 (20 out of 36 for Adams). It was Democratic in 1832, 1836, 1844, and 1852, and Whig in 1840 and 1848. From 1856 to 1864 it was Republican, and then entered on a course of vacillation. It voted for Seymour (Democrat) in 1868, Grant (Republican) in 1872, Tilden (Democrat) in 1876, Garfield (Republican) in 1880, Cleveland (Democrat) in 1884, Harrison (Republican) in 1888, and Cleveland (Democrat) in 1892. The State went decidedly Republican on the money question in 1896 and 1900. The following is a list of the Governors of New York as a colony and a State:

DIRECTORS-GENERAL OF NEW NETHERLAND

Cornells Jacobsen May	1624-25
William Verhulst	1625-26
Peter Minuit	1626-33
Wouter Van Twiller	1633-36
William Kieft	1636-47
Peter Stuyvesant	1647-54

ENGLISH COLONIAL GOVERNORS

Richard Nicolls	1664-66
Francis Lovelace	1666-73

DUTCH OCCUPATION

Anthony Colve	1673-74
---------------	---------

NEW YORK. The chief city of the State of New York, the commercial metropolis of the United States, the largest city of the Western Hemisphere, and after London the largest city in the world. It is situated at the mouth of the Hudson River, which enters the Atlantic Ocean through New York Bay, 205 miles in a direct line northeast of Washington, 715 miles east by south of Chicago, and 190 miles southwest of Boston; latitude of the City Hall, 40° 42' N., longitude 74° W.

The climate, on the whole, is very healthful and enjoyable, but is subject to great extremes. As the continental climate extends to the Atlantic coast of North America, the temperatures of New York City depend, to an important extent, upon the meteorological conditions of the interior regions. The humidity due to the proximity of the sea tends to increase the discomfort both of oppressively hot and severely cold days. The average annual temperature is about 54° Fahr. The mean temperature of the three winter months is about 34°; spring, 52°; summer, 75°; autumn, 57°. July is almost invariably a little warmer than the other summer months. The temperature of the hottest day ranges from 90° to 99°, and the mercury sometimes falls to zero or even below. The annual precipitation is from 36 to 42 inches, the amount of snow being from 20 to 30 inches. Cyclonic storms from the West Indies occasionally bring very high winds, accompanied with a heavy fall of rain or snow.

New York Harbor, one of the finest in the world, has an entrance about a mile wide, between Fort Hamilton, the southwest corner of the Borough of Brooklyn, and Fort Wadsworth, the point opposite on Staten Island. This entrance, known as the Narrows, leads into a fine bay bounded by New Jersey and Manhattan Island on the north, Long Island on the east, Staten Island on the southwest, and New Jersey on the west. It is about five miles wide and six miles long from north to south. The bronze statue, 'Liberty Enlightening the World,' by Bartholdi (see LIBERTY, STATUE OF), the largest statue of modern times, 151.41 feet in height, stands upon a pedestal 155 feet high on Bedloe's Island in the bay. The torch held aloft by the figure is lighted at night by electricity. Governor's Island, near the Battery, the southern point of Manhattan Island, containing 65 acres, is occupied by the United States Government for military purposes. Ellis Island, a mile and a half from the Battery, architecturally prominent, with a fine modern building, also belongs to the United States Government and is used as a landing place for immigrants. On Swinburne and Hoffman Islands, in the Lower Bay, are institutions of the Quarantine Station.

Previous to 1874 the city did not extend beyond Manhattan Island. At the beginning of that year parts of Westchester County were incorporated with it, and in 1895 more territory in Westchester County was annexed. In 1898 the city's

boundaries were enlarged to include Kings County and part of Queens County, on Long Island, the whole of Richmond County (Staten Island), and part of the towns of East Chester and Pelham, south of Westchester County. The city, which embraces an area of 309 square miles, consists of five boroughs. These, in order of area, rank as follows: Queens (124 square miles), Brooklyn (86 square miles), Richmond (57 square miles), the Bronx (40 square miles), and Manhattan (22 square miles). The Borough of Manhattan consists of Manhattan Island (q.v.) and several small islands adjacent. The Borough of Brooklyn is coextensive with Kings County. (See BROOKLYN.) All that section of the city northeast of the Harlem River, with a number of islands, constitutes the Borough of the Bronx. It is nearly bisected by the Bronx River, and is mainly residential, its northern portion having a

Manhattan Island (q.v.), which contains the chief offices of the city, its greatest banks, business houses, museums, tenements, and palaces, lies between the Hudson, East, and Harlem rivers, and is $13\frac{1}{2}$ miles long, with a greatest breadth of $2\frac{1}{4}$ miles at Fourteenth Street. The southern end of the island is laid out irregularly, the early settlers having built their houses wherever they saw fit, the streets being laid out afterwards. Above Canal Street there is greater regularity, while above Tenth Street the city is laid out, with a few exceptions, in blocks about 200 feet in length from north to south, and from about 400 to about 900 feet from east to west. The cross streets are 60 feet wide, as a rule, although there are a number 100 feet wide, placed at an average distance of half a mile apart, in order to facilitate heavy traffic. The avenues running north and south are generally 100 feet wide.

The great artery of New York is Broadway, which unfortunately is only 80 feet wide in the business section of the city, its width being nearly doubled in its northern half. On the east side of the city along the avenues D, C, B, A, First, Second, and Third, counting west from the East River, and in an adjoining area to the south, are the great tenement house districts. On the West Side, along the Hudson, and including the district between Seventh and Tenth Avenues, are manufacturing plants, lumber yards, gas houses, and also many cheap tenements. In the central part of the city, toward the southern end of the island, with Broadway as the main artery, are the largest banks and great commercial houses. Farther up is

WALL STREET ABOUT 1785.

distinctly suburban character, though much of the southern part is closely built up. The Borough of Queens includes that portion of Long Island within the municipal limits, to the north and east of Brooklyn. It comprises Long Island City, Flushing, Jamaica, Newtown, and part of Hempstead. A number of the islands in Jamaica Bay belong to the Borough of Queens. Long Island City is noted for its great industrial establishments. The remainder of the borough consists of many pretty suburban villages and not a few tracts of farm land. The Borough of Richmond is coextensive with Richmond County, the whole of Staten Island. It is largely a district of residences, although it contains a great number of establishments. The seaside resorts in the boroughs of Brooklyn, Queens, and Richmond are frequented in summer by thousands. New York extends over a distance of more than 30 miles from the Yonkers line on the northeast to the southwest extremity of Staten Island.

the retail shopping district, and above that are the homes of the well-to-do classes. Fifth Avenue, which but a few years ago was occupied solely by the homes of rich people, is becoming more and more a business thoroughfare as far as Fiftieth Street. Above Fiftieth Street, however, the character of the present structures—churches, fine club houses, and the spacious homes of the rich—will probably prevent great changes. In 1865, when Central Park was approaching completion, the districts on both sides of the park east and west were entirely unimproved. Along Fifth Avenue, from Sixtieth Street to One Hundredth Street, there were not a dozen houses, where to-day is a solidly built line of handsome dwellings. On the west side of the park the change has been still greater, but in addition to private dwellings there are hundreds of apartment houses. On Riverside Drive, the boulevard which skirts the Hudson River, there are both private residences and

MAP OF NEW YORK CITY (GREATER NEW YORK) and Vicinity.

The geographical features of this Map are produced from data furnished by the U. S. Geological Survey. The boundaries and the division of the City into Boroughs are according to the Charter of the City of New York, 1897.

apartment houses. Riverside Drive is one of the most beautiful avenues in the world. Uptown along the West Side there are miles of small, artistic private houses until the neighborhood of 110th Street is reached, where over large areas apartment houses are again the rule. The upper part of the island along the East Side is solidly built up with tenement houses. A rocky ridge, rising steeply from the Hudson, with an equally abrupt descent toward the east, extends through

a cañon than a street. Chief among the buildings here are the great banks, and the Sub-Treasury, a Doric building of granite, upon the site of the old City Hall, from the balcony of which Washington was inaugurated as first President of the United States. In Broad Street, which runs south from the Sub-Treasury, is the new Stock Exchange, costing \$2,000,000. Opposite the Stock Exchange is the Mills Building, erected twenty years ago at a cost of \$4,000,-

BROAD STREET IN 1796.

the upper part of Manhattan Island, rising finally into hills of nearly 250 feet elevation. These eminences, in part known as Washington Heights, offer charming sites for dwellings, and are in some places compactly built up, while extensive tracts are still covered with woods, presenting exquisite bits of scenery along the Hudson and Harlem rivers.

Blackwell's, Ward's, and Randall's islands, picturesquely situated in the East River, are used for city institutions for the care of the poor, sick, and disorderly. Contagious disease hospitals are maintained by the city on the small islands off Port Morris, in the Borough of the Bronx.

BUILDINGS. Viewed from the bay, the business part of the Borough of Manhattan presents a most extraordinary conglomeration of towering office buildings, varying from ten to twenty-five stories in height, huddled together in apparent confusion upon a strip of land less than a mile wide. Beginning at the Battery, the first building of importance is the Produce Exchange, a modern Renaissance structure of brick and terra cotta, with a fine tower 225 feet high. Opposite the Exchange, on Bowling Green, is the new Custom House, upon the site of the official residence built by the city for General Washington. From Bowling Green to Wall Street, Broadway is lined with immense business structures, each of them costing millions of dollars, occupied by the Standard Oil Company, the Manhattan Life Insurance Company, the Commercial Cable Company, the Union Trust Company, and other large corporations. The Consolidated Stock and Petroleum Exchange is at Broadway and Exchange Place. From Trinity Church, running east to the river, is Wall Street, a narrow thoroughfare so completely lined on both sides with buildings from twelve to twenty stories high, used by banks and financial institutions, as to resemble more

000. It was the first of the luxurious office buildings in the financial district. On the other side of Exchange Place is the Broad-Exchange, a twenty-story granite pile. Trinity Church, the most interesting of New York's churches, stands upon land granted by the English Government in 1697. The original plot embraced a tract of many acres running down to the Hudson River. The first church was completed in 1697, the present one in 1846.

It is a Gothic structure of brown stone. In the churchyard are many monuments in memory of well-known persons. On Broadway, from Trinity Church to the City Hall, are some of the most imposing of the insurance buildings. That of the Equitable Life Assurance Society occupies a whole block. Here also is the building of the American Surety Company, with a cornice 307 feet above the pavement and a foundation extending 72 feet below the street. On the opposite side of Broadway is the main office of the Western Union Telegraph Company. In Cedar Street, a few doors from Broadway, is the Clearing House, maintained by the associated banks of New York. It is a beautiful structure of white marble. In Liberty Street is the palatial home of the Chamber of Commerce. At the junction of Broadway and Park Row stands the Post Office, a large and imposing composite structure, of Doric and Renaissance, upon a triangular plot. Opposite the Post Office is Saint Paul's Chapel, where Washington's pew is shown. Across the way is the old Astor House, a granite hotel which fifty years ago was considered the most luxurious establishment of its kind in the country. Above the Post Office is the City Hall, in City Hall Park. Near by are the entrance to the Brooklyn Bridge, the great buildings of the *World*, *Tribune*, and *Times* on the east, and the lofty structures of the Postal Telegraph Building and Home Insurance Company on the west. To the south is the Park Row Building, one of the tallest in the country, twenty-five stories high, not counting the towers. The City Hall is the most beautiful of New York's earlier buildings. It was begun in 1803 and finished in 1812 at a cost of \$500,000. White marble was used for the front and sides, but brown stone for the back, as it was supposed that the city would not extend beyond it. Back of the City Hall is the

County Court House, a marble building in Corinthian style, and almost opposite, at the corner of Chambers and Centre Streets, is the new and palatial Hall of Records. The Criminal Courts Building, a superb structure on Centre Street, is connected with the Tombs Prison by a covered bridge. The Tombs, a nickname of the city prison, suggested by its original gloomy architecture in Egyptian style, rebuilt in 1898 and much enlarged, is now, architecturally, one of the finest of modern prisons.

Broadway, from Chambers Street to Tenth, is largely given up to wholesale trade, one of the most prominent features along the route, however, being the massive building of the New York Life Insurance Company. West of Broadway, below Canal Street, lies the great wholesale dry goods centre of the United States, and farther uptown are the wholesale dealers in straw goods, millinery, feathers, and ready-made clothing. Where Broadway changes its direction at Tenth Street, the character of business changes.

Here is Grace Church, one of the most attractive ecclesiastical edifices in New York. It is an ornate Gothic structure, built of white limestone. There are other buildings connected with the church, the whole forming a striking group. In this neighborhood are the Astor Library, long the most important library in the city, the Mercantile Library, and at Fourth Avenue and Eighth Street, Cooper Union (q.v.), a brownstone building erected in 1857. Union Square, once the limit of the retail business of the city, and until 1860 surrounded by private houses, is now wholly given up to business. At the lower end of Fifth Avenue, in Washington Square, stands the Washington Arch, erected by popular subscription at a cost of \$128,000, and completed in 1892. It is 70 feet high. On the east side of Washington Square is the large building of New York University, housing the schools of Law and Pedagogy and the Graduate School, and various business establishments. It occupies the site of the celebrated Gothic collegiate structure pulled down in 1894-95. In the district north by east of Union Square lies Gramercy Park, and, at Second Avenue, Stuyvesant Square, on which stands Saint George's Church, with its lofty spires. At Eleventh Street and Second Avenue is the old home of the New York Historical Society, built in 1857. The new building of the society, at Seventy-sixth Street and Central Park West, will cost \$1,000,000. The new Lying-In Hospital at Second Avenue and East Seventeenth Street is one of the handsomest structures of its class in the city. Bellevue Hospital, founded in 1826, occupies two blocks extending from Twenty-sixth to Twenty-eighth street on First Avenue to the East River; the City Morgue is situated in the grounds at the foot of Twenty-sixth Street. Broadway from Ninth Street to Thirty-fifth Street, Sixth Avenue, and Fourteenth and Twenty-third streets contain most of the great retail shops of the metropolis. When the *Herald* Building, copied after a Venetian palace, was built at Thirty-fifth Street and Broadway in 1894, there were but few large retail stores in the neighborhood. To-day the vicinity of Broadway and Thirty-fourth Street bids fair to become the centre of retail trade. One of the largest department stores in the country occupies the block on the west side of Broadway between

Thirty-fourth and Thirty-fifth streets. Along the line of Broadway, from Twenty-third to Fifty-ninth street, are situated a number of important hotels, apartment houses, and the leading theatres of the city. At the angle of Broadway and Fifth Avenue, upon a triangle, 87 by 190 feet, stands a twenty-story wedge-shaped building known as the 'Flatiron,' visible for miles, and presenting a striking architectural contrast with the Madison Square Garden. The graceful tower of the latter, copied from the Giralda of Seville, is surmounted by a gilded statue of Diana. On the east side of Madison Square is the handsome office building of the Metropolitan Life Insurance Company. Another beautiful and imposing marble building is the Court House at Twenty-fifth Street and Madison Avenue, used by the Appellate Division of the Supreme Court.

Saint Patrick's Cathedral (Roman Catholic) on Fifth Avenue, between Fifthieth and Fifty-first streets, ranks among the most imposing Gothic edifices in this country. It is built of white marble in the form of a Latin cross, and its two beautiful spires rise to a height of 332 feet. It cost \$2,000,000. The corner-stone was laid in 1858, and the church was dedicated on May 25, 1879. At Forty-second Street and Fourth Avenue is the Grand Central Station. Above Fifty-ninth Street, on Broadway, apartment hotels are the great feature of this thoroughfare. The first hotels of this character, in which the tenants furnish their own apartments, but take their meals in a common dining-room, appeared in 1888. To-day there are more than one hundred apartment hotels in Manhattan, each housing from 40 to 200 families, and many more are being built. One of the largest groups of apartment houses is that known as the Navarro, at Seventh Avenue and Fifty-ninth Street, built about sixteen years ago at a cost of \$5,000,000. Another noted building of this type is the Dakota, at West Seventy-second Street, facing Central Park. One of the largest of the new apartment hotels is the Ansonia, at Seventy-fourth Street and Broadway, which covers a plot of land 200 X 400 feet, and is 16 stories high.

At 116th Street are the buildings of Columbia University, including a magnificent library, costing about \$1,000,000. Near by are Saint Luke's Hospital and the beginnings of the great Protestant Episcopal Cathedral of Saint John the Divine. The building stands upon a rocky bluff overlooking the Harlem plains on the east. Various estimates of from thirty to fifty years as the time required to finish the building have been made, and the cost may be anywhere from ten to twenty million dollars. In vastness of dimensions and beauty of design it will take its place among the great cathedrals of the world. On Amsterdam Avenue, between 109th and 110th streets, the new building of the National Academy of Design is approaching completion, the well-known Venetian-Gothic building, formerly occupied by the Academy, at the corner of Twenty-third Street and Fourth Avenue, having been demolished in 1901. Facing Central Park on the west side of Seventy-seventh Street is the Museum of Natural History, one immense wing of which, the southern façade, is already complete. On the east side of the park, and within it, facing on Fifth Avenue at Eighty-second Street, is the Metropolitan Museum of Art. The Lenox Library occupies a massive limestone building fronting Cen-

NEW YORK
VIEW OF THE SOUTHERN END OF MANHATTAN ISLAND

tral Park, between Seventieth and Seventy-first streets. Farther up Fifth Avenue at One Hundredth Street is the new Mount Sinai Hospital, one of the largest and most perfectly appointed in the country. At 123d Street and Riverside Drive is the tomb of General Grant, a mausoleum in classic style, covering an area about 100 feet square and rising 160 feet from the ground. It stands upon a bluff overlooking the Hudson. The cornerstone was laid in 1892 and the building was dedicated on April 27, 1897. The bodies of General Grant and his wife lie in twin granite sarcophagi in the crypt under the dome. Farther north, in the Borough of the Bronx, are the handsome library and other buildings of New York University.

PARKS. The first proposal to make a public park for New York was about the beginning of the last century. In 1802 some citizens advocated the setting aside for this purpose of twenty acres around the Collect Pond, a sheet of water situated where the Tombs prison now stands, which was used in summer for boating and in winter for skating. The scheme was rejected, on the ground that the proposed park would be too far from the city. Washington Square, at the beginning of the century the Potter's Field, was redeemed about 1840, and a little later Union Square and Madison Square were cleared of squatters and laid out as parks. It was William Cullen Bryant who first proposed to make a large public park in the upper part of the city. In 1840 he suggested the appropriation of a strip of land known as the Goose Pasture at Sixtieth Street. His plan was to take a section running across the island from river to river. A strip of land was finally appropriated for a public park, but running north and south instead of east and west. Work was begun in 1857. Central Park is now one of the most beautiful pleasure-grounds in the world. It contains 840 acres. About 400 acres are wooded, this area including specimens of nearly every tree and shrub that can be made to grow here. There are nine miles of drives, with thirty miles of foot-paths and other roads; many bridges, archways, and tunnels; several lakes; a large reservoir a mile and a half in circuit; an imposing mall, lined with superb trees; and a large number of statues. Zoölogical and botanical gardens are also among its attractions. On fine days in summer from fifty to sixty thousand persons visit the park. Lawns are provided for free tennis courts, and there is a field for baseball and other games. One of the chief curiosities of Central Park is the Obelisk (see CLEOPATRA'S NEEDLES and OBELISK) presented to the city by the late Khedive of Egypt, Ismail Pasha, which was brought here in 1880.

In Central Park are an equestrian statue of Simon Bolivar, the gift of Venezuela; a bronze statue of Burns, presented by resident Scotchmen; a granite statue of Alexander Hamilton; a life-size bronze statue of Morse, erected in 1871 by the telegraphers of the country; a bronze statue of Sir Walter Scott by John Steele; a bronze statue of Shakespeare by J. Q. A. Ward, unveiled on May 23, 1872, commemorating the poet's birth over 300 years previous; a bronze statue called "The Pilgrim," by Ward, commemorating the landing of the Pilgrims in 1620; an heroic bronze statue of Daniel Webster, by Thomas Ball; and busts of Beethoven, Cervantes, Humboldt,

Schiller, and Thomas Moore. At the entrance to the park at Fifty-ninth Street and Eighth Avenue stands a marble monument to Columbus, a shaft surmounted by a statue, unveiled in 1892. At the Sixth Avenue and Fifty-ninth Street entrance is a bronze statue of Thorwaldsen, erected in 1894 by the Danes of New York. On the Plaza at Fifth Avenue and Fifty-ninth Street is an imposing equestrian statue of General Sherman by Augustus Saint Gaudens. Opposite the Lenox Library, at Seventieth Street and Fifth Avenue, is a memorial to Richard M. Hunt, the architect, consisting of a semi-circular bench with a bronze bust of Hunt, by French, and ornamental figures. The most notable statues in other parts of the city are the bronze figure of Peter Cooper, south of the Cooper Union, by Saint Gaudens; the bronze statue of John Ericsson, by J. Scott Hartley, at the Battery; the statue of Farragut, by Saint Gaudens, in Madison Square Park; the bronze statue of Garibaldi, in Washington Square, by Turini, presented to the city by the Italian residents; the colossal bronze statue of Horace Greeley, in Greeley Square, by Alexander Doyle; the bronze statue of Lafayette, by Bartholdi, in Union Square, presented by French residents in 1876; the bronze statue of Abraham Lincoln, in Union Square, modeled by H. K. Browne, and erected by popular subscription in 1867; the equestrian statue of Washington, in Union Square, also by Browne; and the colossal bronze figure of Washington, by J. Q. A. Ward, at the entrance of the Sub-Treasury in Wall Street.

The most important park of the city after Central Park is Brooklyn's pleasure-ground, Prospect Park. (For description, see BROOKLYN.) The third in interest is Bronx Park, which includes an area of 661 acres on both sides of the Bronx River. It has superb botanical and zoölogical gardens, opened to the public in 1899. Van Cortlandt Park, north of Kingsbridge, is even larger in extent (1132 acres), but is as yet largely undeveloped. The old Van Cortlandt mansion here, erected in 1784, now serves as an historical museum. There are golf links, grounds for baseball, tennis, and polo, and a lake frequented in winter by thousands of skaters. Pelham Bay Park, on the Sound, near Baychester, is the largest of the New York City parks, containing 1756 acres. It is diversified by lakes and islands, and has a shore line of nine miles. These three suburban parks, the Bronx, Van Cortlandt, and Pelham, are connected by a driveway, maintained by the Park Department. On Manhattan Island millions of dollars have been spent in reclaiming and beautifying the strip of land along the edge of the Hudson River from Seventy-second Street to 130th Street, known as Riverside Park, and since 1901 a handsome viaduct and driveway across Manhattan Valley connects the Park with the northern heights. Morningside Park, the bluff at Columbus Avenue, between 110th and 123d Streets, has also been laid out with excellent taste. The Harlem River Speedway, extending for two miles along the western bank of the river from 155th Street to 208th Street, was completed in 1898. Above Manhattan Island are Crotona and Claremont Parks, in the vicinity of Tremont, and Saint Mary's Park (28 acres) at 149th Street. There are many squares and small parks throughout the city. The playgrounds and recreation piers, of which

there are several, should be mentioned in connection with this phase of municipal activity. The Park Department has also under its care a well-stocked aquarium (q.v.) in the old Castle Garden at the Battery.

CHURCHES. There are over 800 churches in Manhattan and the Bronx, ranging in seating capacity from 200 to 2,000. The Dutch Reformed Church (32 societies) has the oldest church organization in New York. The finest of its churches is the Third Collegiate, at Fifth Avenue and Forty-eighth Street, which owes its ample endowment to fortunate real estate investments. Other handsome buildings of this denomination are the Bloomingdale Church, at Broadway and Sixty-eighth Street, and the Marble Church, at Fifth Avenue and Twenty-ninth Street. Next in antiquity is the Protestant Episcopal Church (94 parishes). Something has already been said of the parent church, Trinity, of the new cathedral of Saint John the Divine, and of Grace Church. This denomination possesses a number of notable buildings, several of which are chapels of Trinity, built and supported out of its endowment. Saint George's, the Transfiguration (in Twenty-ninth Street near Madison Avenue), Saint Thomas's, and Saint Bartholomew's are all fine examples of ecclesiastical architecture. The most noted Presbyterian church (71 churches) is that known as the Fifth Avenue, at Fifty-fifth Street. The Madison Square Church and the Brick Church, at Fifth Avenue and Thirty-seventh Street, are among the strongest organizations of the denomination. The John Street Methodist Episcopal Church (62 Methodist Episcopal churches) occupies the site of the first of this denomination in America, and is known as the cradle of American Methodism. The most noted Baptist church (49 churches) is that at Fifth Avenue and Forty-sixth Street. Among the Congregational churches is the Tabernacle. The old church which stood at Broadway and Thirty-fourth Street was sold, and a new one, built at Broadway and Fifty-sixth Street, was opened in 1905. All Souls', at Fourth Avenue and Thirty-fourth Street, is the oldest of the Unitarian churches, while the Divine Paternity, at Central Park West and Seventy-sixth Street, holds a similar position among the Universalist churches. There are 114 parishes of the Roman Catholic faith, the Cathedral of Saint Patrick, at Fifth Avenue and Fiftieth Street, being one of the finest church buildings of the city. The oldest of its churches is Saint Peter's, in Barclay Street, which stands upon the site of a chapel built in 1786. The first Jewish synagogue of the city (136 societies) was the Shearith Israel, founded about 1675, and now possessing a beautiful temple at Central Park West and Seventieth Street. The Temple Emanu-El, at Fifth Avenue and Forty-third Street, the Beth-El, at Fifth Avenue and Seventy-sixth Street, and the Temple Israel, in Harlem, are all fine buildings. Also noteworthy are the temples of the First Church of Christ (Scientist), Central Park West and Ninety-sixth Street, and of the Second Church, Central Park West and Sixty-eighth Street. The Young Men's Christian Association, which for 30 years had its headquarters at Fourth Avenue and Twenty-third Street, has now finished a new house on the same street, west of Seventh Avenue. The association has fifteen branch buildings. That at Madison Avenue and Forty-fifth Street, for

railroad employees, was erected by the late Cornelius Vanderbilt. The Young Women's Christian Association has a beautiful home at 7 East Fifteenth Street.

EDUCATIONAL INSTITUTIONS. The number of schools within the jurisdiction of the city, omitting the Nautical School, exceeds 500. Of corporate schools, orphan asylums, and industrial schools there are above 50, with an average attendance of some 18,000. The College of the City of New York (q.v.), at Lexington Avenue and Twenty-third Street, was established in 1847 under the name of the New York Free Academy. It will soon move to handsome buildings, estimated to cost \$4,000,000, at 138th Street and Convent Avenue. The Normal College, at Sixty-ninth Street and Park Avenue, has accommodations for 1600 students. There is also a State Normal School at Jamaica, in the Borough of Queens. An important work of the Department of Education is the lecture system, under which free evening lectures are given in a number of places from October to May. The Board of Education also provides free night schools. The most important of the private educational institutions is Columbia University (q.v.), on Morningside Heights. Barnard College (q.v.), for women, and the Teachers College, for both sexes, are affiliated with the university. The College of Physicians and Surgeons (the medical department of the university) occupies extensive buildings on Sixtieth Street, near Roosevelt Hospital. Barnard College and the Teachers College, with which is incorporated the Horace Mann School, also have suitable buildings of their own on Morningside Heights. New York University (q.v.) maintains professional departments in the Borough of Manhattan, and undergraduate and engineering schools at University Heights, in the Borough of the Bronx. Its main site, in the Bronx, on the heights overlooking the Harlem, is one of singular beauty. Here is the Hall of Fame (q.v.). The Union Theological Seminary, which has academic relations with New York and Columbia universities, is at Fourth Avenue and Sixty-ninth Street. It is one of the chief training schools for ministers of the Presbyterian Church. The Protestant Episcopal Church maintains its General Theological Seminary in a group of beautiful buildings, modeled after the Oxford college type, at Ninth Avenue and Twentieth Street. The new building of the Jewish Theological Seminary of America, in 123d Street, between Amsterdam Avenue and Broadway, was dedicated in 1903. Cooper Union occupies a prominent place among the educational institutions of the city. Its classes, with very few exceptions, are entirely free. The attendance is large. Saint John's College, at Fordham, in the Borough of the Bronx, the College of Saint Francis Xavier, and Manhattan College are important institutions under control of the Catholic Church. Cornell University (q.v.) maintains part of its medical department in New York City. Among independent professional institutions are the New York Law School; the New York Homeopathic Medical College and Hospital, the New York Medical College and Hospital for Women, and the Eclectic Medical College; the New York College of Dentistry and the New York Dental School; and the College of Pharmacy of the City of New York.

LIBRARIES AND MUSEUMS. For many years the Astor Library, founded under the will of John Jacob Astor, who died in 1848, leaving \$400,000 for the purpose, was the only free library of importance in the city. The Mercantile Library, which was founded in 1820, is a subscription library with more than 230,000 volumes. The Astor Library, in Lafayette Place, is entirely for reference, and is visited by about 125,000 readers every year. The Lenox Library (reference), at Fifth Avenue and Seventieth Street, the gift of the late James Lenox, was opened to visitors in 1877. In 1895 the Astor and Lenox libraries and the Tilden trust fund were consolidated as the New York Public Library (q.v.). The number of volumes is now over 785,000. The new building for the Public Library, a vast structure of white marble, 366 feet long and 246 feet wide, is upon the site of the old reservoir at Fifth Avenue, between Fortieth and Forty-second streets. Its estimated cost is about \$5,000,000. It has shelving capacity for 1,250,000 volumes. The first circulating library dates from 1880. There are now sixteen circulating libraries and reading rooms, which form a part of the general system, the New York Public Library, the New York Free Circulating Library, and other libraries having been consolidated in 1901. In the same year Andrew Carnegie offered the city \$5,200,000 for the purpose of building branch libraries on condition that the city furnish sites. Some sixty libraries will be built under this gift. The first one was opened in January, 1903. The library of Columbia University contains about 325,000 volumes, of which 10,000 are in the reference room open to the public. The Cooper Union Library contains about 32,000 volumes, the chief feature of which is a complete set of patent office reports. Among the private libraries of importance are those of the Historical Society, the Geographical Society, and the New York Society Library. The last, founded in 1754, has about 100,000 volumes. There are also special collections of books belonging to the American Society of Civil Engineers, the New York Academy of Medicine, with 46,000 volumes, the New York Law Institute, having about the same number, and the Bar Association.

The Metropolitan Museum of Art, the most important in this country, for which a superb series of buildings on the east side of Central Park is projected, and partly completed, is the outcome of a public meeting held in 1869. Gifts came in so rapidly from citizens that the Legislature authorized the building of a fire-proof structure in Central Park at a cost of \$500,000. This was formally opened in 1880. During the last twenty-five years a collection of art objects of every description, to the value of several million dollars, has been gathered, chiefly by gifts from public-spirited citizens. There are paintings, statuary, porcelains, ivories, tapestries, musical instruments, and Greek, Roman, and Egyptian antiquities. In 1902 a handsome entrance wing facing on Fifth Avenue was finished. The Rogers bequest of \$6,000,000 will enable the Museum to make great progress. The American Museum of Natural History, on Central Park West, contains vast collections of stuffed animals, birds, reptiles, fishes, shells, and fossils. The main lecture hall will seat 1000 persons. Museums of great interest are maintained

also by the Historical Society, Columbia University, and the Lenox Library, the last named having a fine picture gallery.

THEATRES, CLUBS, HOTELS. New York has about 40 theatres, in addition to almost as many more variety houses and concert halls. The largest is the Metropolitan Opera House, opened in 1883, which occupies the block bounded by Broadway, Seventh Avenue, Thirty-ninth and Fortieth streets. It seats 3200 persons. Among the largest and most luxurious of the theatres, most of which are on or near Broadway, are the Broadway, at Forty-first Street; the Casino, at Thirty-ninth Street; the Criterion, at Forty-fourth Street; Daly's, at Thirtieth Street; the Knickerbocker, at Thirty-eighth Street; the Empire, at Fortieth Street; the Herald Square, at Thirty-fifth Street; the Garrick, in Thirty-fifth Street; the Manhattan, at Thirty-third Street; Wallack's, at Thirtieth Street; the Savoy, in Thirty-fourth Street; the Victoria and Belasco's, at Forty-second Street; the New York, at Forty-fifth Street; and the Majestic, at Fifty-ninth Street. In other parts of the town should be mentioned the American Theatre, at Eighth Avenue and Forty-second Street; the Garden Theatre, at Madison Avenue and Twenty-seventh Street; and the Irving Place Theatre, a German high-class theatre, at Fifteenth Street and Irving Place. Among the newest theatres are the Lyceum, in Forty-fifth Street, and the Hudson, in Forty-fourth Street. The most important music hall of the city is that built by Andrew Carnegie at Fifty-seventh Street and Seventh Avenue, which is known by its founder's name. It was opened in May, 1891. It is one of the finest concert halls in the world, and cost more than \$1,000,000. The main hall seats 3000 people, and there are two smaller concert rooms. The most important concerts of the season, such as those of the Philharmonic Society, the Boston Orchestra, and the Oratorio Society, are given here. Mendelssohn Hall, a beautiful music room occupied by the Mendelssohn Glee Club, in West Fortieth Street, is used for many of the smaller concerts, recitals, etc. The total seating capacity of New York's places of amusement has been estimated at over 80,000. The Harlem section also has several fine theatres, among which are the Harlem Opera House, near Seventh Avenue on 125th Street, and the West End Theatre, on 125th Street west of Manhattan Avenue. The Star Theatre, at Lexington Avenue and 107th Street, is also a large house.

The clubs of New York number more than 200. The oldest and most conservative of the non-political clubs is the Union, at Fifth Avenue and Fifty-first Street, organized in 1836. The Union League Club, at Thirty-ninth Street and Fifth Avenue, is the largest political club. The most important club of artists and literary men is the Century Association, organized in 1847, which possesses a beautiful building in West Forty-third Street. Among other noted clubs may be mentioned the Army and Navy, City, Calumet, Colonial, Grolier, Knickerbocker, Lawyers', Lotus, Metropolitan, New York, Players', Progress, Reform, and University. The Players' Club, as its name implies, has a membership largely composed of theatrical people. Its beautiful home on Gramercy Park, costing \$250,000, was presented to the club by the distinguished tragedian Edwin

Booth. The University Club membership is restricted to graduates of colleges. Its club house, an imposing structure of granite, opened in May, 1899, at Fifth Avenue and Fifty-fourth Street, is one of the finest in the city. The New York Yacht Club also has a magnificent club house on West Forty-fourth Street.

New York has about 40 hotels that may be ranked as first-class, with as many more in the second class, and perhaps 100 of a lower grade. The largest and best-known is the Waldorf-Astoria. It is built upon the site of the family mansions in which lived for many years John Jacob Astor and William Astor, his brother. This structure covers the block between Thirty-third and Thirty-fourth streets, bordering Fifth Avenue, and having a depth of 500 feet. It is 16 stories in height, and contains over 1000 rooms for guests, a large ballroom, and a number of smaller apartments used for public dinners, concerts, etc. The Buckingham, at Fifth Avenue and Fiftieth Street; the Holland House, at Fifth Avenue and Thirtieth Street; the Murray Hill, at Park Avenue and Forty-first Street; the Manhattan, at Madison Avenue and Forty-second Street; the Netherland and the Savoy, at Fifth Avenue and Fifty-ninth Street, are large and luxurious hotelries, which accommodate from 800 to 2000 guests. Farther downtown, a number of the Broadway hotels, such as the Fifth Avenue, at Twenty-third Street, the Hoffman House, at Twenty-fifth Street, and the Imperial, at Thirty-second Street, are equally popular. Several immense hotels, among which may be mentioned the Plaza, at Fifty-ninth Street and Fifth Avenue, and the Majestic, at Seventy-second Street and Central Park West, are known as family hotels of the best type. The most luxurious restaurants in the city are Delmonico's, at Forty-fourth Street and Fifth Avenue, and Sherry's, almost opposite. In the business district the Café Savarin, in the Equitable Building, is well known.

CHARITIES. The great number of immigrants landing at the port of New York, the poorest of whom remain in the city, tends to increase the dependent class. The administration of public charities is under a separate department governed by a commissioner, who appoints two deputies and other subordinate officers. New York City differs from other large American cities in that it grants large subsidies to private charitable institutions, the amount spent in this way exceeding that apportioned to public charities. In 1901 the city maintained three almshouses, with 3846 inmates, and 11 hospitals, two of which are asylums for idiots, with 53,991 patients. Nearly all of the city institutions and some of the State and private institutions are located on Randall's, Ward's, and Blackwell's islands, in the East River. Sailors' Snug Harbor, a home for aged seamen, is on Staten Island. This institution derives an income of \$250,000 from valuable Broadway real estate, with which it is endowed. The orphan asylums of New York are under private control. Private charity is active and thoroughly organized; and much has been done to correlate the different agencies by the Charity Organization Society of New York City. The society has a number of sub-committees in charge of the different districts into which the city is divided. The Brooklyn Bureau of Charities performs a similar function in that borough.

Among the more important organizations which give attention to charitable work are the United Hebrew Charities, Children's Aid Society, Saint Vincent de Paul Society, and the Association for Improving the Condition of the Poor. The conditions in the crowded sections of the city have been greatly improved by the work of Social Settlements and similar institutions, of which there are a large number, some denominational, others non-sectarian. Manhattan alone has some 25, the best known of which are University Settlement and the Educational Alliance.

INTERCOMMUNICATION. The problem of passenger transportation within the limits of New York City and its residential areas offers peculiar difficulties. The wholesale business is at the lower end of Manhattan Island, and the shopping districts in the middle, while the dwelling districts are at the upper end, and across the waterways in the surrounding regions. The crowding and discomfort on the various car and ferry lines during the 'rush' hours surpass anything of the kind known in any other city of the world. There are car lines on almost all the thoroughfares leading north from the business district, the limit of surface transportation in this direction having been practically reached. The first elevated railroad was opened on Ninth Avenue in 1870, from the Battery to Fifty-ninth Street. The Sixth Avenue line, opened in 1878, extended from the Battery to the Harlem River, the upper half being on the line of Ninth and Eighth avenues. Similar lines were built on Third and Second avenues to the Harlem River, and later the Third Avenue line was carried across the Harlem River into the northern suburban districts. The elevated roads, on which it was found practicable to run trains by steam at a high rate of speed and at very short intervals, with a minimum of danger, soon proved utterly inadequate for the traffic. In 1886 the first cable line in Manhattan was established on 125th Street. In 1898 the underground electric trolley system was introduced and rapidly supplanted the cable all over Manhattan. The overhead trolley system still prevails in other portions of Greater New York. In 1902 the elevated roads began to run their trains by electricity. A contract was awarded in January, 1900, by a commission created for the purpose, for an underground rapid transit railway system running from one end of Manhattan to the other, with a branch, starting at 104th Street, to the Bronx. Work upon the subway was begun in February of that year. The time fixed by the contract for the completion of the system was four years and a half, and the original price was \$36,500,000. The contractors were conceded the right to operate the road for fifty years. Thirty-five stations are provided for on the main line and 13 on the Bronx branch. An extension of the subway to Brooklyn was decided on in May, 1901. The cars are operated and lighted wholly by electricity. Express trains run on two central tracks.

There is a very extensive ferry system between Manhattan and the surrounding region. Besides the ferries to Brooklyn (q.v.), lines connect with Jersey City, Hoboken, Weehawken, Fort Lee, Staten Island, and other points. During the winter months the ferry traffic is somewhat impeded by occasional fogs and floating ice. The construction of the Brooklyn Bridge (see BRIDGE) in 1883 greatly facilitated communication with

oklyn; but in recent years the bridge has wholly inadequate. A second bridge was in 1896, extending from Delancey Street, Manhattan, to Broadway, Brooklyn; three other ones are projected: from Grand Street, Manhattan, to Williamsburg, Brooklyn; from Corlies Hook, Manhattan, to the Navy Yard, Brooklyn; and from Fifty-ninth Street, Manhattan, to Island City, by way of Blackwell's Island. Furthermore, two tunnels to connect Manhattan and Brooklyn have been planned, one by private road companies (also connecting with the Jersey Shore), and the other by the city upon the extension of the subway. The Harlem River is spanned by a number of costly bridges, Washington Bridge being perhaps the best structure of its kind in the country, and the Croton Bridge, which carries the old Croton Aqueduct at an elevation of over 100 feet, being unequalled among American stone bridges.

NEWSPAPERS. There are forty-eight daily newspapers published in New York City, with ninety-weekly papers, and seventy-two monthly publications, not including trade organs and religious journals. The oldest of the daily newspapers are the *Commercial Advertiser*, founded in 1797, and the *Evening Post*, founded in 1801, of which William Cullen Bryant was for nearly fifty years the editor. The *Sun*, founded in 1833; the *Herald*, founded in 1835 by James Gordon Bennett; the *Times*, founded in 1841 by Horace Greeley; the *World*, founded in 1850 by Henry J. Raymond; the *Journal*, the *Press*, the *News*, and the *Staats-Zeitung* are the most important of the morning newspapers. The *Evening Post*, the *Commercial Advertiser*, the *Mail Express*, the *Telegram*, the *Evening Sun*, the *World*, and the *Evening Journal* are the afternoon publications. See **NEWSPAPER**.

COMMERCE AND INDUSTRY. New York did not rise to commercial preëminence until the beginning of the nineteenth century. Its rise is due to its central position on the Atlantic seaboard, and especially to its excellent harbor, which lies at the entrance of a fine natural waterway, the Hudson River (the Mohawk Valley, leading to the highly fertile North-Central portion of the United States). The opening of the Erie Canal in 1825 was the most important event in the business history of the city. New York was already far in advance of its rivals before the building of railroads began, a fact which tended to make it a great point in their construction. It is difficult to overemphasize the importance of New York as an entrepôt of trade. It is without a rival as a centre of the wholesale dry goods and grocery business. Not only does it market the manufactures and the greater part of its imports, but the trade in many varieties of domestic goods, produced outside of the city, centres here.

PORT. The harbor proper consists of the lower and upper bays, the former covering about twelve miles of anchorage, and the latter 14 miles. Between the two is Staten Island. The principal passage from one to the other is by the east channel called the Narrows, at one point is only a mile in width. Small boats may pass also on the west side of the Narrows. The harbor is approached from the ocean from two directions, the principal one being from the northeast. The Sandy Hook Bar stretches across this entrance, about 20 miles from the

lower end of Manhattan, the deepest channel having been originally 16 feet at mean low water. In 1884 the National Government provided for dredging this channel to a width of 1000 feet and a depth of 30 feet. In 1899 a provision was made for the dredging of another entrance channel farther to the east, 2000 feet wide and 40 feet deep, requiring an excavation about 7 miles in length. Work upon this channel is still in progress. The other entrance into the harbor is from Long Island Sound. From the Sound, the passage leads through Hell Gate, at Ward's Island, into the East River, which is about half a mile in width. The tide flows very swiftly through the river, especially the ebb-tide. Extensive improvements were begun on this course about 1868 and are still going on. The channel has been made amply deep and safe for coastwise traffic. In 1901 the battleship *Massachusetts*, drawing 27 feet of water, successfully passed through it. The great strength of the ebb-tide current serves to keep the port open in winter, and, in a measure, to prevent the deposit of sediment. The North River (Hudson), which is about one mile in width, does not carry as much sediment as most rivers. Some dredging, however, has been necessary.

The Sandy Hook entrance to the southeast is guarded by elaborate fortifications on Sandy Hook. (See **FORT HANCOCK**.) The passage through the Narrows is protected by Fort Hamilton on the east (Long Island) shore and by Forts Tompkins and Wadsworth on the west (Staten Island) shore. Besides the works at the east entrance of Long Island Sound, the approach from that direction is defended by fortifications on the closely approaching points, Throggs Neck and Willets Point, within the limits of the city, and on Davids Island, a few miles to the north. Governor's Island, just south of Manhattan, is also fortified.

Almost the entire water front of Manhattan, about 22 miles, is deep enough to admit of heavy shipping, and the total frontage within the limits of the greater city is several times this. The docks already constructed occupy but a small part of the available space. Docks and piers naturally were built first on the lower end of Manhattan, the line gradually being extended northward on both sides of the island. The line is almost unbroken on the west side for a distance of about four miles, and many piers are still farther north. On the east docks are less numerous. In Brooklyn the docks extend along that portion of the shore opposite the lower end of Manhattan and farther south in Gowanus Bay. A part of the water front of Manhattan was acquired by the city from the Crown of England and subsequently State laws added to the portion belonging to the city. The greater part of the entire frontage, including in 1901 170 whole and 12 half piers out of a total of 224, is controlled by the city. The Brooklyn water front is owned mainly by private persons.

TRANSPORTATION. New York City has profited immensely from the advantages of internal transportation afforded by the Hudson River and the Erie Canal. In recent years the canal traffic has decreased. The canal is still of great importance, however, owing to its competition with the railway lines. All the railroads which approach New York from west of the Hudson River have their terminals in New Jersey. These lines are

the Pennsylvania, the West Shore, the Erie, the New York, Ontario and Western, the Lackawanna, the Philadelphia and Reading, the Lehigh Valley, the Central Railroad of New Jersey, and the Baltimore and Ohio. The Pennsylvania Company has projected a tunnel from the New Jersey shore under North and East Rivers to Long Island, with a great station in Manhattan. The lines which approach from the north, the New York Central and Hudson River, and the New York, New Haven and Hartford, have a union passenger station, the Grand Central Station, under the control of the New York Central. The Long Island Railroad maintains terminals in Long Island City and Brooklyn. The daily traffic on all these lines to the suburbs is enormous.

TRADE. The port of New York includes all the municipalities on New York Harbor and the Hudson River. In 1901 64 per cent. of the total imports and 35.60 per cent. of the total exports, or 45.73 per cent. of the total foreign trade of the United States, passed through New York, its commerce being five times that of the next largest American port. The imports for that year were valued at \$527,259,906 and the exports at \$529,592,978. While the trade is rapidly increasing, there has been in recent years a relative decrease, the port in 1882 having had nearly 57 per cent. of the total trade of the country. New York has practically a monopoly in the trade between the European countries and the Great Lake and Northwest region. On the other hand, its location places it at a disadvantage with the more southern Atlantic Coast ports in the trade with the Lower Mississippi and the Ohio Valley regions. Some of the leading imports of the country, such as rubber and elastic goods, silk goods and furs, are received almost wholly through New York. It also imports the bulk of manufactured goods generally, including manufactures of cotton, linen, and jute goods, jewelry and precious stones, chemicals, coffee, cocoa, and tobacco. It leads in imports of sugar. The relative rank of the city is much lower in respect to the principal exports of the country. It exports less than one-half of the animal products, less than one-fourth of the breadstuffs, corn, wheat, flour, etc., the shipments of the latter class having decreased in recent years, and only about one-tenth of the cotton. It exports a large part of the copper and most of the machinery. In 1901 878 sail and 2945 steam vessels engaged in the foreign trade cleared the port of New York. Their aggregate tonnage was 8,118,427. The volume of the coastwise trade greatly transcends that of the foreign trade. The transfer of freight at the port of New York is done almost wholly through the use of barges, lighters, etc., as there are no railroad tracks along the docks.

MANUFACTURES. The value of the manufactured products of New York is considerably more than 50 per cent. greater than that of any other American city. Manhattan and Bronx alone rank first, Brooklyn alone ranks fourth. Of fifteen industries selected by the census of 1900 for comparison between the great manufacturing centres, New York City held first rank in eight. The total capital invested in manufactures in that year was \$921,876,000, and the value of products aggregated \$1,371,358,000. The industrial prominence of the city is not due to large iron and steel, textile or meat-packing interests—the industries which have been re-

sponsible for the growth of many American cities—but rather to a large group of manufactures peculiar to city life and mainly of local interest. The city's most important industry is the manufacture of clothing. In the census year 1900 the value of women's clothing (factory product) was \$102,711,604, and of men's clothing, \$103,220,201, besides a great amount of custom work and repairing, and dressmaking. The aggregate output of all industries in but two other cities exceeded the value of the clothing product of New York. The abundance of cheap, unskilled labor, in consequence of the large immigrant population, partially explains the growth of this industry. Much of the work is done in tenement houses and small workshops, and comparatively little in large factories. Sugar and molasses refining ranks second in value of the product, which in 1900 was \$88,598,113. In the printing and publishing business, the value of which in 1900 was \$78,736,069, New York ranks far above other American cities. Among other industries are the manufacture of foundry and machine-shop products, malt liquors, tobacco, cigars and cigarettes; the roasting and grinding of coffee and spices; the manufacture of millinery and lace goods, men's furnishing goods, fur goods, shirts, furniture, musical instruments, paints, and electrical apparatus and supplies. New York has hardly a rival in the variety of its highly finished manufactured articles. The sugar and molasses refining industry is confined mainly to Brooklyn. There are also in Brooklyn extensive foundries and machine shops, and establishments for the roasting and grinding of coffee and spices.

GOVERNMENT. The first charter of Greater New York went into effect January 1, 1898. But it was found defective in several important respects, and in 1901 the Legislature made radical changes. Under the amended charter, the Mayor is elected for two years. Much power and responsibility is given him, especially in the appointment and removal of administrative officers. The heads of 14 of the 15 administrative departments—law; police; fire; water supply, gas, and electricity; street-cleaning; bridges; parks; docks and ferries; health; public charities; corrections; education; taxes and assessments; and tenement houses—are appointed by the Mayor, as are also certain other officers, including three civil service commissioners. He may remove any of these officers except members of the board of education, aqueduct commissioners, trustees of the College of the City of New York, trustees of Bellevue and allied hospitals, and judicial officers. Legislation is in the hands of a single body, the board of aldermen, consisting of 73 members elected for two years, the president of the board being elected by the whole city. The aldermanic districts generally coincide with the districts into which the city is divided for the election of members of the State Legislature. The Mayor's veto is final when placed upon grants of franchise, but in other matters it may be overridden. Many interests are provided for through local government, the five boroughs being divided into 25 local improvement districts. In each borough a president is elected, in whom important powers are vested. The borough presidents control such matters as the grading and paving of streets, sewers, public baths, etc., and the presidents of Queens and Richmond have control also of street-clean-

NEW YORK
THE TOMB OF GEN. U. S. GRANT (UPPER)
THE LIBRARY OF COLUMBIA UNIVERSITY (LOWER)

ing. Each borough has a bureau of buildings, the superintendent of which is appointed by the borough president, and is subject to removal by him. In the smaller districts there are local boards of improvement, consisting of the president of the borough as chairman and those members of the board of aldermen who represent the districts within the area subject to improvement. The resolutions of the local board upon certain subjects must be submitted to the Mayor. Most of the offices in the departments are filled in accordance with civil service requirements.

POLICE, FIRE, AND HEALTH DEPARTMENTS. The police commissioner appoints all members of the force from the eligible lists furnished by the civil service commission, and has power of dismissal. He is assisted by three deputies. The department includes also 15 inspectors and one captain to each 50 patrolmen. The total force in February, 1903, of men and officers was 7679. For patrol service the city is divided into 80 precincts, each having its own building with quarters for the men, cells for prisoners, and lodgings for homeless persons. Each precinct is in command of a captain under whom are several sergeants.

On January 1, 1902, the fire department of New York City had an active force of 2602 men. There were 137 engine companies, including 5 fire boats, and 44 hook and ladder companies. The companies constitute battalions, each under the command of a chief of battalion. The chief of department is at the head of the entire force.

The health department is administered by a board of health, consisting of a commissioner appointed by the Mayor, the commissioner of police, and the health officer of the port. The sanitary superintendent is chief executive officer of the board. A corps of medical inspectors is employed for the detection and prevention of disease, the inspection of tenement houses, and the enforcement of the sanitary code. There are also a vaccinating corps, a corps for disinfection, and one for the inspection of milk, meat, and other food products.

WATER SUPPLY. Manhattan and the Bronx have an excellent water supply, derived from the Croton River (q.v.), supplemented by the Bronx River. The Croton River, which is nearly 40 miles north of the City Hall, includes in its basin a number of small natural lakes and three artificial reservoirs, the largest of the latter being Croton Lake, in the main stream of the river. From this lake the aqueducts lead. There are a small receiving and a large retaining reservoir in Central Park, and a 'high service' reservoir at High Bridge. Another large reservoir is under construction on the site of Jerome Park, and plans have been made for a large distributing reservoir at 135th Street and Tenth Avenue. The storage system has a total capacity of more than 40,000,000 gallons. A new dam, the central masonry portion of which is 600 feet long and 260 feet high, is being constructed across the Croton River. This dam will add 21 square miles to the drainage area and increase enormously the storage capacity. There are also three smaller dams in course of construction. The supply reaches the city through two aqueducts, an old one with a capacity of 75,000,000 gallons a day and a new one with a capacity of 318,000,000 gallons a day. The average consumption of water in 1902 was more

than 250,000,000 gallons a day. The Brooklyn water supply is obtained from small local streams, ponds, and wells. There is a large reservoir in the eastern part of the Borough of Brooklyn and a small one near the entrance to Prospect Park. The daily consumption in this borough is about 100,000,000 gallons.

FINANCE. The budget of New York is considerably more than three times that of any other American city, and greater than that of any other city in the world. The actual income for 1901 was \$118,740,596, including \$1,285,821 received from the State for schools. Of this amount, \$76,886,091 was collected from property taxes; \$5,557,593 from liquor licenses; \$5,048,788 from special assessments; \$8,050,900 from water rates; and \$2,571,584 from docks and wharves. The total expenditures for the same year were \$102,946,573 for maintenance and operation, and \$53,451,000 for construction and capital outlay other than loans repaid. The principal items of expenditure for maintenance and operation were: schools, \$19,731,629; interest on debt, \$13,693,155; police department, \$10,199,206; fire department, \$4,739,993; hospitals, asylums, almshouses, and other charities, \$4,754,380; water-works, \$3,000,990. The principal items for construction were: streets, \$8,109,494; schools, \$5,471,460; ferries and bridges, \$4,458,739; water-works, \$3,450,870; docks and wharves, \$3,322,938. There is a bonded debt of \$426,174,823 and a floating debt of \$6,306,472. Against this indebtedness there is a sinking fund of \$121,340,920. The city's legal borrowing limit (exclusive of the water debt) is 10 per cent. of the assessed valuation. The basis of assessment is legally 100 per cent. of the value of both real and personal property. The valuable franchises which have been granted to private companies return an entirely disproportionate income to the city treasury.

The expenses of Greater New York are much larger than were the combined expenses of the various component municipalities before consolidation. The increase in the first year after consolidation amounted to \$15,000,000. This is due largely to the creation of more salaried offices and to increases in salaries. The salaries paid are the highest prevailing in any city of the world. There is a board of estimate and apportionment, consisting of the Mayor, Comptroller (elected by popular vote), president of the board of aldermen, and the five borough presidents (the presidents of Manhattan and Brooklyn having two votes each), which annually submits the budget to the board of aldermen. The board of aldermen cannot insert new items, increase the amount specified, or vary the stipulated terms and conditions; but there are certain items which it may reduce. The financial department is in charge of the Comptroller, and is divided into five bureaus. All officers in the department except two, one of whom is the city chamberlain, or treasurer, are appointed by the Comptroller.

POPULATION. Greater New York has about twice the population of any other American city, and is exceeded only by London among the cities of the world. This has come about almost wholly in the nineteenth century, during which time the city grew at a rate never equaled. In the colonial period New York ranked below Boston and Philadelphia. In 1790 there was a

population of 33,131; in 1800, 60,515; 1810, 96,373; 1820, 123,706; 1830, 202,589; 1840, 312,710; 1850, 515,477; 1860, 805,658; 1870, 942,292; 1880, 1,206,299; 1890, 1,515,301; and in 1900 (after the creation of a Greater New York), 3,437,202, including 1,850,093 in the Borough of Manhattan, 200,507 in the Borough of the Bronx, 1,166,582 in the Borough of Brooklyn, 152,999 in the Borough of Queens, and 67,021 in the Borough of Richmond. The suburbs on the New Jersey shore of the Hudson (Jersey City, Hoboken, etc.) contain about 300,000 inhabitants. Beyond these immediate suburbs we come to a section of New Jersey embracing Elizabeth, the Oranges, Montclair, Morristown, Plainfield, and many other places which are mainly suburbs of New York, in addition to the two great manufacturing centres of Newark and Paterson, also the homes of great numbers of New York business men. These places have a total population of about half a million. On the northeast the cluster of towns largely inhabited by persons doing business in New York extends beyond the boundary line of Connecticut. Among these may be mentioned New Rochelle, Rye, Portchester, Greenwich, and Stamford. The total population embraced within a radius of 25 miles from the New York City Hall is not far from five millions. As the city grew, the population of New York naturally tended to centre about the lower end of Manhattan, the business district. Inconveniences, too, incident to transportation across the river have aided in confining the population within the narrow limits of Manhattan Island, where the density of population is greater than in any other city whatsoever. The distribution of the population in Brooklyn is more normal. In 1900, 66.70 per cent. of the population of Manhattan and the Bronx lived in dwellings containing twenty-one or more persons, while in Brooklyn the corresponding percentage was only 25.70 per cent. In Chicago it was 16.63. The density per acre in the Borough of Manhattan was 129.2. The region of greatest density is the lower East Side, where in the Eighth Assembly District, covering 98 acres of area, there was in 1900 a population of 735.9 to the acre. In the densely populated section, tenement houses having an average height of five or six stories, inadequately lighted and ventilated, and otherwise lacking in sanitary facilities, are the rule. Several large model tenement houses have recently been built, notably those of the City and Suburban Homes Company. The housing problem, therefore, is one of the most difficult with which the city has to deal, and presents phases almost unknown in other large centres of population. A radical tenement house law, which went into effect in 1902, is effecting a great improvement. The problem of congestion is closely related to that arising from the presence in the city of large classes of mostly poor foreigners. The various foreign elements tend to form distinct colonies. In the Eighth District, above mentioned, 67.2 per cent. of the population in 1900 were foreign born, and the greater part of the remainder were children of foreign-born parents. In 1900 the foreign born numbered 1,270,080, or 37 per cent. of the total population of the city. In Manhattan alone, 41.5 per cent. of the total population was foreign born. New York has been always a strikingly cosmopolitan city. During the middle

of the nineteenth century there was a very heavy German and Irish immigration to the city, but before the end of the century the immigration of these nationalities had greatly declined, and there had begun a heavy immigration from the south and east of Europe. According to the census of 1900, the principal foreign countries represented in the immigration to New York City in order of prominence were Germany, Ireland, Italy, Russia, Bohemia, Hungary and Austria, Poland, England, Scotland, and Wales. Few of the many Scandinavian immigrants to the United States have settled in New York. The large immigration from Austria-Hungary, Russia, and Poland consists almost wholly of Jews. Nearly one-fourth of the population of Manhattan are Jews. A large proportion of New York immigrants represent a class of unskilled laborers. The German immigrants, however, have always contained a large class of skilled artisans, who have participated in the more advanced industrial life of the city, and have contributed greatly to its social and artistic life. A much larger percentage of the Irish have been unskilled laborers. The Italians have come mainly from the poorer districts of southern Italy, and almost all are laborers. Most of the coarser labor of the metropolis is done by them. The Jewish immigrants, like the Italians, are extremely poor and mostly unskilled. The majority are employed in the manufacture of clothing; many, however, are small merchants. Both of these elements keep to themselves. It is in the parts of the city occupied by them that the density of population is greatest. The negro population in 1900 numbered 60,666, of whom nearly two-thirds were born outside of New York State. Of the total population of the city, 1,705,705 were males and 1,731,497 females.

HISTORY. Probably the first European to visit the vicinity of New York was Giovanni Verrazano, who came in 1524; in 1525 the Spanish navigator Gomez sailed into the harbor; and by 1600 the French seem to have begun an extensive trade with the Indians along the Hudson. In September, 1609, Henry Hudson (q.v.) explored the harbor and the river; in 1613 four trading houses were built on Manhattan Island—"Manhatanis" (meaning 'those who dwell upon an island') being the name applied to the aboriginal Delaware inhabitants; and in 1614 Adriaen Block, preparatory to exploring the New England coast, built here his little vessel the *Onrust*, or *Restless*, probably the second ship to be built in America. In 1614 the States General of Holland chartered the United New Netherland Company of Amsterdam, and in 1621 this was succeeded by the West India Company, chartered with power to make treaties, maintain courts, and employ soldiers. In 1623 permanent colonists, sent out by the Dutch West India Company, arrived under Cornelis May as Director-General or Governor. In 1624 May was superseded by Verhulst, who in turn was replaced in 1626 by Peter Minuit. Minuit in this year bought the island from the Indians for goods valued at 60 guilders, or \$24.00 (about \$120.00 in present values), and built near the present Bowling Green a small fort, Fort Amsterdam—the settlement itself, then having a population of 200, being called New Amsterdam. In 1628 a church was organized and the first clergyman, Rev. Jonas Michaelius, arrived at New Amsterdam.

Wouter Van Twiller was Governor of the colony from 1633 to 1638, William Kieft from 1638 to 1647, and Peter Stuyvesant from 1647 to 1664. In 1643 the Dutch, without provocation, massacred 120 Algonquin Indians, who had come to them for protection, and a bloody Indian war ensued, lasting for two years, and almost depopulating the settlement. In 1653 New Amsterdam, with a population of about 800, was incorporated as a city, and in the same year a wall 2340 feet long was built along the site of the present Wall Street as a protection against the English and the Indians.

In March, 1664, Charles II. granted New Netherland to his brother James, Duke of York, and on September 8th Col. Richard Nicolls with an English force took possession of the city and renamed it New York. Nicolls was Governor until 1668, when he was succeeded by Francis Lovelace. On August 9, 1673, the Dutch regained possession, and the province became New Netherland as before, the city becoming New Orange, and Anthony Colve replacing Lovelace as Governor. On November 10, 1674, the Dutch again gave way to the English, Edmund Andros becoming Governor; in 1686 the first city charter, known as the Dongan Charter, from Thomas Dongan, Governor in 1681-88, was issued (though it was never confirmed by James II.); and in 1689, Andros being overthrown, Leisler usurped control and held it until early in 1691, when he was executed for treason. See LEISLER, JACOB.

In 1690 the first intercolonial Congress (called to consider an attack on Canada) was held in New York—Massachusetts, Plymouth, Connecticut, Maryland, and New York being represented—and in the same year the only Mayor elected by the people until after 1832 was chosen. Slavery had been introduced in 1625; in 1712 a negro insurrection was put down with much cruelty, twenty-one negroes being executed (some by burning, others by hanging, and one by breaking on the wheel); and in 1741 the discovery of a supposed plot, 'The Great Negro Plot,' caused a panic, during which four whites were executed, and 154 negroes were arrested, of whom 13 were burned at the stake, 18 were hanged, and 71 were transported. In 1693 William Bradford set up the first printing press in New York; in 1703 the first free school was opened; and in 1725 the first newspaper, the *New York Gazette*, was founded. A city library was organized in 1729, and a classical academy was opened in 1732. In 1731 a new charter, known as the 'Montgomerie Charter,' was granted to the city. In 1732 a monthly stage was established between New York and Boston, the trip taking two weeks each way, and in 1766 a Philadelphia stage, taking 'three days through only,' began running.

John Peter Zenger, who had founded the *New York Weekly Journal* in 1733, was arrested and prosecuted for libel by the authorities in 1734, but he was acquitted in the following year after a famous trial—his acquittal being regarded as the greatest vindication in the colonial period of the freedom of the press. See ZENGER, JOHN PETER.

In 1765 the Stamp Act Congress (See STAMP ACT) met in New York, and on January 18, 1770, nearly seven weeks before the Boston Massacre, British soldiers killed one citizen and wounded three in a riot caused by the destruction by the soldiers of a liberty pole set up by the 'Sons of Liberty.' This riot, called the 'Battle of

Golden Hill,' is ranked by some writers as "the first conflict of the War of the American Revolution." In 1774, during the excitement over the tea tax, a ship loaded with tea was sent back to England, and the cargo of another was thrown overboard. When news of the battle of Lexington reached New York, a 'Committee of Safety' assumed control of the city, and Governor Tryon took refuge on a British man-of-war. In the early summer of 1776 a large part of the American troops were quartered in New York. On July 8th, in the presence of Washington, the Declaration of Independence was for the first time publicly read to them, and on the 9th the equestrian statue of George III., erected on Bowling Green in 1770, was torn down. On September 14, 1776, a short time after the battle of Long Island (q.v.), the city was evacuated by the Americans and was occupied on the following day by the British, who held it until November 25, 1783—'Evacuation Day.' On September 15, 1776, a large portion of the city was destroyed by fire. During the British occupation the city was the refuge of Loyalists, who came from all quarters to take advantage of British protection, many of the more wealthy and influential residents joining their ranks. From 1785 to 1790 Congress met in New York in the old City Hall, at the corner of Wall and Nassau streets, and here Washington was inaugurated, April 30, 1789.

In 1785 a manumission society was formed and the Bank of New York was organized. In 1789 the Tammany Society (q.v.) or Columbian Order was organized. During an epidemic of yellow fever, from October, 1794, to July, 1795, more than 600 persons, and during another in 1798 more than 2000 persons, died. In 1790 the population numbered 33,131, and the city limits were extended to the lower line of the present City Hall Park. In 1805 the population was 78,770, and since then, especially after the War of 1812, when immigration greatly increased, the growth has been very rapid. In 1807 Fulton's steamboat, the *Clermont*, began running regularly between New York and Albany. In 1812 a steam ferry to Long Island was opened, and a line of Sound steamers was established in 1818, while in 1819 the *Savannah*, built in New York, successfully crossed the Atlantic. The Erie Canal, begun in 1817, was completed in 1825—the first boat, *Seneca Chief*, reaching New York on November 4th—and gave an extraordinary impetus to the growth of the city. In 1832 an epidemic of cholera caused the death of 4000 persons, and another two years later caused the death of nearly 1000. In 1835, December 16-19, occurred the most disastrous fire in the history of the city, the entire east side below Wall Street, including about 650 stores, the Merchants' Exchange, and the South Dutch Church, being destroyed, with a loss of almost \$10,000,000. The financial panic of 1837 caused many failures, and the great destitution and suffering in the city led to the Bread Riots of that year. From 1820 to 1870 riots were frequent, one of the most serious being the Astor Place Riot (q.v.) of May 10, 1849, in which 141 soldiers were wounded, while 34 rioters were killed and many more were wounded. In the same year more than 5000 persons died of the cholera. Another riot occurred in 1857, growing out of a conflict between two police organizations,

when the Seventh Regiment of militia was called out to preserve the peace. The Croton aqueduct was completed in 1842; and on July 14, 1853, the Crystal Palace Industrial Exhibition was opened on what is now Bryant Square. Another severe financial panic occurred in 1857, followed by suspension of banks and business failures.

On the approach of the Civil War many in the city seemed to favor the South, and in January, 1861, the Mayor, Fernando Wood (q.v.), proclaimed secession to be 'a fixed fact,' and proposed that an independent commonwealth, to be called 'Tri-Insula,' be formed out of Manhattan, Long, and Staten Islands. The city, however, loyally supported the Union during the war, sending to the front 116,382 soldiers at a cost of about \$14,500,000. In July, 1863, occurred the Draft Riots (q.v.), lasting three days, during which business was suspended, property worth more than \$1,500,000 was destroyed, and more than 1000 lives were lost. The city suffered for several years from frauds, perpetrated by the 'Tweed Ring,' which controlled municipal affairs, but in 1871 the 'Ring' was convicted of having robbed the city of more than \$20,000,000, and was effectually broken up. (See *TWEED, WILLIAM M.*) In 1869 a financial panic, caused by the effort to 'corner' gold, culminated on 'Black Friday' (September 24th), gold then being at 162½. The financial panic of 1873 caused the greatest suffering in New York City, although its growth continued unabated. On May 24, 1883, the Brooklyn Bridge was formally opened, and in 1886 the Bartholdi Statue of Liberty was unveiled. New York has been the scene of many imposing processions and celebrations: On the occasion of Lafayette's visit in 1824; the celebration of the opening of the Erie Canal in 1825; the funeral processions of Lincoln, April 25, 1865, and of General Grant, August 8, 1885; the laying of the Atlantic cable, 1858; the opening of the Brooklyn Bridge; the centennial celebration of Washington's inauguration as President of the United States, in 1889 (from April 29th to May 1st); the Columbian celebrations of October, 1892, and April, 1893; the reception to the Santiago fleet in 1898; and the Dewey reception in 1899.

NEW YORK, COLLEGE OF THE CITY OF. A public institution of learning in New York City,

established by the Board of Education of the city in 1848, and originally known as the Free Academy. Collegiate powers were granted to it in 1858, and in 1866 it assumed its present name. The members of the Board of Education were ex-officio trustees of the college until in 1900 a separate board of trustees was created, composed of nine members appointed by the Mayor, with the president of the college and the president of the Board of Education as ex-officio members. In 1882 the requirement of one year's previous attendance at the public schools of the city was repealed, and the college was thrown open to all young men of the city. In 1900 the length of the course was increased from five years to seven, comprising three years' attendance in the preparatory department and four years of collegiate work. There are five courses of study, leading to the degrees of B.A. or B.S. The M.A. and M.S. degrees are conferred after two years of additional study. Instruction and the use of text-books and apparatus are free to students. The college was one of the first institutions to establish a separate chair of English and to make manual training a part of the curriculum. In 1902 the process of securing a new site for the college, then situated at Lexington Avenue and Twenty-third Street, was completed. The new home of the college is located in the block bounded by 138th and 140th streets, Saint Nicholas Terrace, and Convent Avenue. Ground was broken on March 10, 1903, and the erection of new buildings, estimated to cost \$4,000,000, was begun. In 1903 the collegiate department had an attendance of 817, and the preparatory department 997. The instructors numbered 110. The buildings and grounds on the old site were valued at \$846,500, and the new grounds at \$800,000, the total value of the college property being \$1,646,500, and its income \$299,362. The library contained 34,911 volumes and 2000 pamphlets. During the first half century of the history of the institution there were but two presidents, Horace Webster (1848-69) and Gen. Alexander S. Webb (1869-1901), both graduates of West Point, and the discipline and curriculum have been greatly influenced by that institution. In 1903 John Huston Finley, professor of politics at Princeton University, became president.

NEW YORK ACADEMY OF SCIENCES, THE. An association incorporated in 1818 as *The Lyceum of Natural History in the City of New York*, which was exchanged in 1876 for the present name. In 1902 the Academy was empowered by legislative enactment to obtain funds and erect a building for scientific uses, and to exercise such other powers as appertain to the scope of such institutions. Membership in the Academy consists of four classes: active members, fellows, corresponding members, and honorary members. Fellows are chosen from the active members in virtue of their scientific attainments. The number of corresponding members is limited to two hundred, and honorary members to fifty. The following sections of the Academy are in active operation: astronomy, physics, and chemistry; biology; geology and mineralogy; anthropology and psychology. The Academy publishes *Annals and Memoirs*.

NEW YORK BAT. See **RED BAT**.

NEW YORK HISTORICAL SOCIETY. A society formed for the collection and preservation of materials relating to the national, civic, or ecclesiastical history of the United States in general, and the State of New York in particular. The idea of such a society was first agitated in Massachusetts in 1789 by John Pintard, but it was not until November 20, 1804, that the New York Historical Society was organized by a number of leading citizens, among them De Witt Clinton, Anthony Bleecker, and Peter G. Stuyvesant. The history of the society since that time has been one of earnest effort in the formation of a library and museum, a gallery of paintings, a department of antiquities, and other features in which it has been eminently successful. The library has a choice and valuable collection of books, lithographs, maps, manuscripts, engravings, etc., besides a collection of works on heraldry. The picture gallery contains 889 paintings, of which about 200 are portraits, and 600 pieces of sculpture, mostly portrait busts and medallions. The collection includes the New York Gallery of Fine Arts, the works of the American Art Union, the Bryan Gallery of Old Masters, the Durr Collection, and the original water colors prepared by Audubon for his work on natural history. In the department of antiquities there is the Abbott collection of Egyptian antiquities, considered one of the greatest in the world. The society spent the first five years of its existence (1804-09) in old Federal Hall, on Wall Street. It occupied rooms in the Government House from 1809 to 1816; in the New York Institution from 1816 to 1832; in Remson's Building, Broadway, from 1832 to 1837; in the Stuyvesant Institute from 1837 to 1841; and in the New York University from 1841 to 1857. Since 1857 it has been installed in the building at 170 Second Avenue.

NEW YORK PUBLIC LIBRARY. The New York Public Library, Astor, Lenox, and Tilden foundations, was formed by the consolidation on May 23, 1895, of the Astor Library, the Lenox Library, and the Tilden Trust.

The Astor Library, incorporated January 18, 1849, was founded by John Jacob Astor, who bequeathed \$400,000 to establish a free public library; gifts from other members of the Astor family trebled its buildings, added largely to its book collections, and increased its endowment to \$941,000 in 1895. Opened February 1, 1854, with about 80,000 volumes, in 1895 it had 267,147 volumes.

The Lenox Library, incorporated January 20, 1870, received from James Lenox his library, art collection, its site and building, and an endowment amounting to \$505,500 in 1895. It was not a general reference library, but an institution for the exhibition and scholarly use of book rarities. In 1895 it contained 86,000 volumes.

The Tilden Trust was incorporated March 26, 1887. To it (before incorporation) Samuel Jones Tilden had bequeathed his private library, 20,000 volumes, and the bulk of his estate, over \$5,000,000, to establish a free public library. The will was contested and the trust provisions declared invalid. By a compromise agreement the executors secured for the trust about \$2,000,000, part of the share of one of the heirs.

The new corporation had an endowment of about \$3,446,500, owned the Astor and Lenox li-

brary sites, and possessed 353,147 volumes and pamphlets. Through an address to the Mayor legislative permission was secured May 19, 1897, for an issue of bonds by the city to construct a building on the reservoir site at Forty-second Street and Fifth Avenue, and to contract with the library for its occupancy. Plans were adopted November 10, 1897, and the corner stone was laid November 10, 1902.

On December 11, 1900, the New York Free Circulating Library offered to consolidate; the offer was accepted and on February 25, 1901, reorganization was completed. The following libraries also came into the system: Saint Agnes Free Library on August 1, 1901; Washington Heights Free Library on December 1, 1901; the New York Free Circulating Library for the Blind on February 21, 1903; and the Aguilar Free Library on February 28, 1903. By these accessions the circulation department consisted on March 1, 1903, of 18 branch libraries, owning 320,816 volumes.

On March 12, 1901, Andrew Carnegie offered to give about \$5,200,000 to erect branch libraries in New York City, if the city would furnish sites and maintain the branch libraries when built. An act passed April 26, 1901, permitted the city to accept such a gift, and in a contract executed July 17, 1901, between the city and the library acting as Carnegie's agent, the city agreed to provide 42 (later increased to 65) sites in Manhattan, Bronx, and Richmond, on which the library agreed to erect buildings with funds provided by Carnegie, the city agreeing to pay annually for their maintenance one-tenth of the sum expended by Carnegie. The first building so erected, on East Seventy-ninth Street, for the Yorkville branch, was opened December 13, 1902; the second, for the Chatham Square branch, was opened in the summer of 1903; four more will be ready by the end of the year.

In the new institution the 500 periodicals received in 1895 have increased to 4500 in 1903; the annual receipts of 12,483 volumes and 2599 pamphlets in 1895 increased to 65,381 volumes and 87,868 pamphlets in 1902; the 94,331 readers consulting 260,694 volumes in 1895 increased to 165,434 readers consulting 410,671 volumes; and the total of 353,147 pieces available to readers in 1895 amounted to 1,131,961 on March 1, 1903.

NEW YORK UNIVERSITY. An institution of higher learning in New York City. It had its inception at a meeting of citizens of high business and professional standing in the rooms of the New York Historical Society, January 4, 1830, when a committee of nine was elected to proceed in the establishment of a new university on a liberal and comprehensive foundation. The committee secured a long list of subscribers to the undertaking and finally merged its existence into that of the first University Council elected by the subscribers, October 16, 1830, and chartered April 18, 1831. The original university building was erected in 1835 on Washington Square. The University College was opened in 1832; the Law School in 1835; the Medical School in 1841; the School of Applied Science (formerly Civil Engineering) in 1862; the Graduate School in 1886; the School of Pedagogy in 1890; the Veterinary College (incorporated with the university) in 1898; and the School of Commerce in 1900. The greatest era of development in the

history of the university was the period between 1890 and 1900. In 1891 the grounds on University Heights overlooking the Harlem River were acquired, and in 1894 the College of Arts and Pure Science and the School of Applied Science were removed to the new site, the schools of Law and Pedagogy and a part of the Graduate School remaining in a new structure on Washington Square. The various schools hitherto loosely connected were now reorganized into one university system. The university in 1902 comprised six faculties besides the School of Commerce, the Woman's Law Class, and the Summer School, having in all 212 professors and instructors, and 2101 students. (1) University College confers the degrees of B.A. and B.S. (2) The University Law School (coeducational) confers the degrees of LL.B., LL.M., and J.D. (3) The Medical College, together with the Veterinary College, confers the degrees of M.D., D.S., and D.V.S. (4) The School of Applied Science confers the degrees of C.E. and M.E. (5) The Graduate School confers the degrees of M.A., M.S., Ph.M., and Ph.D. (6) The School of Pedagogy confers the degrees of Pd.M. and Pd.D. The School of Commerce, Accounts, and Finance confers the degree of B.C.S. (bachelor of commercial science). The Summer School had in 1902 12 instructors and 113 students. The library of the university contained in 1902 over 55,000 volumes, including the Oswald Ottendorfer Collection. The campus covers about 22 acres, and its chief architectural feature is the library building, completed in 1900, at a cost of \$750,000. An open colonnade known as the Hall of Fame (q.v.) extends partly around the library, overlooking the Harlem. The total value of the buildings and grounds in 1902 was \$2,945,342; the endowment was \$2,080,179; the gross income \$467,839, and the total value of the college property \$5,025,522. The government of the university is vested in a Senate consisting of the chancellor, the deans of the several schools, and six professors elected, one from each school, together with advisory members. The chancellors of the university have been James Matthews, Theodore Frelinghuysen, Isaac Ferris, Howard Crosby, John Hall, Henry M. MacCracken.

NEW YORK WEASEL. See WEASEL.

NEW ZEALAND, *ze'land*. A British colony in the South Pacific Ocean, situated between latitudes 34° 25' and 47° 17' S., and between longitudes 166° 26' and 178° 36' E., a little more than 1000 miles southeast of the Australian continent. New Zealand proper consists of two large islands, North Island and South or Middle Island, separated by Cook Strait, from 16 to 100 miles wide, and of a smaller island, Stewart Island, lying 25 miles south of South Island, from which it is separated by Foveaux Strait. Several of the outlying groups, known as the Auckland, Chatham, Cook, Kermadec islands, and other small islets, are also attached to the colony. The area of North Island is 44,468 square miles, of South Island 58,525, and of Stewart Island 665 square miles. The total area of the colony is estimated at 104,471 square miles, being nearly equal to that of Italy, to which peninsula the shape of New Zealand bears a striking resemblance.

TOPOGRAPHY. The surface of North Island is in the main gently undulating, with low hills and table-lands densely forested. There are, however, several volcanic peaks in this island, from 4000

to over 9000 feet high. Of these Tarawera and Tongariro, on the mainland, and Whakari, in the Bay of Plenty, are active volcanoes, while the highest extinct cones are Ruapehu (9715 feet) and Mount Egmont or Taranaki. The latter is a solitary peak standing at the west entrance to Cook Strait. It is 8270 feet high, and its summit is covered with perpetual snow. South Island differs in a marked degree from North Island. It has no volcanoes, but along its whole western coast runs a lofty and rugged mountain range known as the Southern Alps, which rivals the European Alps in its wild mountain scenery. It has a height of from 8000 to over 12,000 feet, Mount Cook, the highest point, being 12,349 feet above the sea. It is deeply cleft, with numerous ravines and precipices, while on the western slope there are great glaciers, in some places reaching within a few hundred feet of the sea. The range is generally covered with forests to the snow line. On the eastern flank of the Alps is a plateau bounded by a lower range running through the centre of the island, from which the land descends in terraced, grassy plains to the eastern coast.

The coast-line of New Zealand measures about 3000 miles, two-thirds of which forms the coast of North Island, which is much indented with bays, two of them almost separating the north-western peninsula from the mainland. Really good harbors, however, are few, as most of the bays are obstructed by bars. The best harbors are those of Auckland and Wellington. The rivers are small and unimportant, the largest being the Waikato, in North Island. The lakes by contrast are interesting. Those in North Island are of volcanic origin. The largest is Lake Taupo, with a diameter of 22 miles and an enormous depth. The region surrounding it is full of hot springs and geysers, among which rose the famous pink and white terraces of siliceous deposits which were destroyed by an eruption in 1886. In South Island, along the eastern slope of the Alps, extends a series of elongated mountain lakes supposed to be, like the deep fiords of the southwest coast, of glacial origin. The largest is Wakatipu, which is said to rival Lake Lucerne in beauty. Though its surface is 1060 feet above sea-level, its bottom is in some places 500 feet below.

CLIMATE. The climate is varied, but in general equable, with no intense heat or cold. The mean temperature for January is 68° in the north and 58° in the south; for June it is 51° in the north and 40° in the south. Frost is almost unknown in North Island. The rainfall varies from 28 inches in the east to over 100 inches on the west coast. The coast districts are very windy, which fact contributes toward rendering the climate healthful.

FLORA. The flora is poor in species, but two-thirds of the indigenous forms are entirely peculiar to the islands, and 26 of its genera are represented nowhere else. The forests as well as the vegetation generally are characterized by a dull monotonous green, there being very few plants with conspicuous flowers. Though the flora is related to that of Australia, as well as to South America and the Antarctic islands, some of the most common Australian genera, such as Eucalyptus and Acacia, are absent. The ferns, mosses, and hepaticas are especially abundant and characteristic, large tracts of

COPYRIGHT, 1903, BY DODD, NEAD & COMPANY.

open land on the lower hills and plateaus being covered with ferns, among which the palm-like tree-ferns, reaching a height of 30 to 40 feet, are prominent. The Nikau palm (*Rhoplostylis sapida*) is found in North Island, this being the extreme southern limit of true palms. One of the most common forest trees is the magnificent kauri pine (*Dammara australis*). It yields fine timber and a valuable gum, and has been recklessly cut by settlers. The output of this gum in 1900 was 11,116 tons, valued at £607,919.

FAUNA. The fauna is, like the flora, characterized by a great paucity of species. There is probably not a single indigenous mammal, the dogs and rats found by the European discoverers having been almost certainly introduced by the natives. There are few reptiles, and no snakes, but several peculiar lizards. Insects are also few, as are the fresh-water fishes; and birds form almost the only group of animals that is well represented. There are about 150 species of birds, most of which are aquatic, and nearly all are peculiar to the islands. They include many beautiful forms, pigeons and parrots being especially numerous. The kiwi, a wingless and tailless bird of the size of a hen, is the sole survivor of a large group of similar birds, including the gigantic moa, which formerly inhabited New Zealand. A considerable number of European forms, both plants and animals, have been introduced, wild pigs being very common.

GEOLOGY AND MINERALS. North Island is essentially volcanic in structure and origin, while South Island consists largely of ancient metamorphic and sedimentary rocks, slates, granites, and Silurian sand and limestones, with small areas of Mesozoic and Tertiary strata. Coal is found under a considerable area in South Island, and to some extent in North Island. Gold exists chiefly under the glacial drift and in the sands along the seashore. Silver, copper, tin, antimony, manganese, and chrome-iron are also found.

MINING. Up to the end of the year 1900 the total mineral product amounted to £75,997,890, of which £57,406,100 was gold. The most productive gold districts are Otago, which yielded over £22,000,000, Westland, nearly £18,000,000, Auckland, and Nelson. As compared with other Australasian States, New Zealand ranks second in the total gold and third in the total mineral output. The most productive period of gold-mining was from 1862 to 1873, in which period nearly one-half of the whole yield was secured. There was some revival in the industry from 1890 to 1900. The gold exported in 1901 amounted to £1,753,784. The mining of gold by the dredging method has developed extensively in the Clutha River bed and other streams of that district. Most of the gold from South Island was secured either from this method or from hydraulic sluicing. Gold from the Auckland district was secured from quartz only, as was also much of the Westland product. The cyanide process is being adopted, thus resulting in a greatly increased per cent. of the ore saved. The next most important mineral mined is coal, the total production of which through 1900 was valued at £7,688,393. The output has increased steadily from 299,923 tons in 1880 to 1,093,999 in 1900. In 1900 the yield of kauri-gum (resin) was 11,116 tons, valued at £607,919. The total yield to the end of 1900 amounted to £10,

329,831. Small quantities of silver and silver-lead, and a few other minerals also, are mined.

AGRICULTURE. Agriculture together with grazing is the leading occupation. The climatic conditions are more favorable for general agriculture than in any of the States of the Australian Commonwealth. The rainfall is more adequate, and the per acre yield of all crops much greater. The largest farm district is on the east coast of South Island. In 1902 there were in the colony 62,786 agricultural holdings, with a total of 34,911,573 acres occupied (over one-half the total area), of which 26,982,486 acres are under private ownership, the balance being held by the Government. About two-thirds of the total area is supposed to be adaptable to agriculture or grazing. The total area under crops increased from 68,506 acres in 1861 to 1,044,777 in 1891, and to 1,578,958 in 1900-01. Nearly one-half of the acreage is under green crops, mainly turnips and rape. The principal other crops in the last-mentioned year were oats, 449,534 acres; wheat, 208,465; barley, 30,831; hay, 68,023; potatoes, 28,524; and maize, 14,232 acres. English grasses grow much better in New Zealand than in Australia, and the acreage sown in grass—10,244,739 in 1890—was 14 times more than that of the Australian Commonwealth. The per acre yield of the artificial grasses is many times that of the natural grasses in Australia. In 1900 there were in addition to the sown pasture land 21,857,909 acres of improved land in the occupied holdings that were available for stock feeding.

STOCK-RAISING. Probably no other country of similar area equals New Zealand in the extent of its sheep-grazing interests. The number of sheep increased steadily from 2,761,583 in 1861 to 20,230,829 in 1894, and has since remained at a little below this figure. Recent years have shown a rapid increase in the number and a decrease in the size of flocks. Another change has been the tendency to raise sheep for meat rather than for wool exclusively. Both cattle and horses are steadily increasing in number, the former numbering in 1900 1,256,680 and the latter 266,245. In the same year there were 250,975 swine. In recent years dairying has rapidly developed and there is an extensive production of butter and cheese. The industry is carried on by the factory method through the co-operation of small farmers.

MANUFACTURING. The number of hands employed in the manufacturing industry increased from 22,095 in 1885 to 25,633 in 1890, and 27,389 in 1895. The value of the products increased still more rapidly, being £9,549,360 in the last-named year. The largest item in this amount was frozen and preserved meats, followed by the tanning and wool-scouring products, and the products of saw-mills, grain-mills, clothing and boot factories, butter and cheese factories, iron and brass works.

TRANSPORTATION AND COMMERCE. In 1902 there were 2235 miles of railway in operation, the total cost of construction being £18,170,722. The province owns and operates nearly the entire railway system. In 1901-02 the net earnings amounted to £622,349. In 1901-02 there were 7,356,136 passengers carried, or more than twice the number carried in 1891-92. There are tramway systems in all the principal towns. The extensive insular coast line and many harbors afford excellent facilities for water transportation from one

part of the country to another. Considering the smallness of the population, the foreign commerce is large. In 1900, 616 vessels entered New Zealand ports, with a tonnage of 854,632. Of these 372 were from the Commonwealth States, 83 from the United Kingdom direct, and 161 from other countries. The total tonnage has more than doubled since 1881. The value of imports increased from £6,260,523 in 1890 to £10,646,096 in 1900, and the value of exports increased during the same period from £9,811,720 to £13,246,161. Almost the whole of the imports is for home consumption and the domestic exports are of domestic origin. Nearly three-quarters of the total exports are contributed by the agricultural and pastoral industries, wool being the largest item, followed by frozen meat, butter and cheese, and grain. The export of frozen meat began in 1882 and increased steadily until 1900, when it was estimated at £2,123,881, almost the whole of which went to England. Gold and kauri-gum are also important exports. About three-fifths of the imports are from the United Kingdom, and over three-fourths of the exports are to that country. In the trade of the colony the Australian States rank second and the United States third. The imports from the United States are much in excess of the exports to the United States. Auckland, Wellington, Bluff Harbor, Littleton, and Dunedin are the largest ports.

BANKS. Owing to the active participation of the colonial Government in the economic life of the community, the field of private banking is a comparatively limited one. In 1890 there were five commercial banks, and in 1900 the same number. The deposits have increased from £343,316 in 1867 to £15,570,610 in 1900. Of the five banks two are New Zealand institutions proper and the other three are branches of the Australian banks. The Bank of New Zealand is the most important institution and is semi-governmental in its nature. Four out of the six directors are (according to the act of 1898) appointed by the Government, which is both a heavy shareholder and depositor. Of the total deposits this bank has almost 50 per cent. The whole amount of loans made by all five banks in 1900 was £12,084,744, of which 30 per cent. were made by the Bank of New Zealand. These five banks are also banks of issue. Their notes are not legal tenders, but can be made so for a limited time by a proclamation of the Governor. In 1866 there were six private savings banks. These still existed in 1900, with 31,475 depositors and £855,792 deposits; but the law of 1867, which established the postal savings system, prohibited the organization of other private savings banks.

Forty-six banks were established under the postal system in 1867, and in 1900 there were 445. The number of accounts increased from 2156 in 1867 to 197,408 in 1900, and the sum of deposits from £71,197 to £5,809,552. Nearly every family has an account. The public trustee does the work usually done in the United States by the private trust companies. Also, the land registration offices compete with the private banks in holding real estate mortgages. The high development of the coöperative spirit in New Zealand has also made the building societies and friendly societies successful. The governmental insurance system attracts a considerable amount of the people's savings.

GOVERNMENT. The Parliament is composed of

two bodies, the Legislative Council and the House of Representatives. The former consists (1902) of 44 and the latter of 80 members. They hold office for seven years except such as were elected prior to September, 1891, who hold for life, as all members did before that date. There are 80 members in the other House. They are elected for three years. All registered adults of either sex who have resided in the colony one year and three months in the electoral district can vote. There are four native Maoris in the Lower House, elected by the adult (male and female) native population. The administrative function is in the hands of a Governor, appointed by the Crown, and the Ministry of eight members. The Governor has the power of veto over bills or can submit bills for consideration. He summons, prorogues, and dissolves Parliament. For purposes of local government the country is divided into counties and boroughs, road districts and town districts.

FINANCE. The participation of the Government in industrial activities resulted in large annual receipts and expenditures and in a heavy debt. The receipts from taxation increased from £1,755,414 in 1880-81 to £3,042,890 in 1900-01, and receipts from other sources increased during the same period from £1,529,628 to £2,864,026. In the fiscal year ending in 1901 the receipts from the customs amounted to £2,180,862, being the most important single source of revenue. In the same year the receipts from the railroads were £1,720,641; from stamps, including post and telegraph, £903,935; from land tax, £294,584; and from the income tax, £173,809. The total expenditure increased meanwhile from £4,019,850 to £5,479,704, and the public debt from £28,185,711 to £49,591,245. There was a sinking fund in 1901 of £1,033,494. The largest items of expenditure are the public debt charges, £1,745,616, and railways, £1,144,832. Other important items are education, £481,087; post and telegraph, £416,364; and the constabulary and defense, £347,448. The rate of increase of the debt of the colony has not been nearly so rapid as that of its wealth.

DEFENSE. All the principal ports are strongly defended by means of batteries, torpedo-boats, and submarine mines. All males between seventeen and forty years and unmarried men between seventeen and forty-five are liable to military service. In 1901 there was a volunteer force of 17,000 men.

STATE ACTIVITIES. New Zealand has become well known because of the various ways in which the functions of the State have been extended. The tendency in this direction was well developed prior to 1890, but became especially marked about that time. The movement has been the outgrowth largely of the influence exerted by organized labor upon legislation. The power of this element has been exercised through the existing political parties, and not through the agency of any politico-socialistic organizations such as have generally sought to advance radical movements in other countries. The experiment, for instance, has been made of preventing strikes and lockouts and adjusting questions at issue between labor and capital by compulsory conciliation and arbitration. Provisions are made by which either employers or trade unions may bring the dispute before a board of conciliation, and if a satisfactory agreement is not reached the question can be carried to the central court of arbitration. The decision made

by this court is final and is enforced, the award against an association, however, being subject to a maximum limit of £500. In practice the plan has accomplished the purpose intended, strikes and lockouts having been wholly prevented. A number of other measures affecting labor have been carried into effect, such as factory inspection, prevention of child labor, specification of hours of labor, and the occurrence of holidays. A system of old-age pension provides that all persons of good character who are over sixty-five years of age and have been twenty-five years in the colony may be pensioned if their income falls below specified limits.

Another phase of State activity receiving much attention has been the public land policy. The attempt is being made to secure and retain the public ownership of the land, and freehold is gradually giving way to perpetual lease. The policy of compulsory purchase has resulted in the breaking up of many large holdings held largely for speculative purposes, and has secured a genuine settlement upon such lands. Ordinarily purchases are affected by friendly negotiations, and compulsion is not often necessary. Prior to March, 1902, £2,117,352 had been paid for 107 estates. In order to make a settlement and improvement of the land possible by persons of small means, the Government advances loans to the settlers. The interest charged is 5 per cent. Over £3,000,000 has been lent in this way. Lands that are leased are leased for 999 years subject to certain conditions of residence and improvements. The annual rental is fixed at 4 per cent. on the cash price or 'prairie value' of the land, and there is at no time a right to purchase the freehold. District land boards have charge of the transfer of lands. The State has assumed the ownership of a number of utilities, including railroads, telegraphs, and telephones, and engages in the life insurance and the banking business. The results have been generally satisfactory to the advocates of the system. The colony has also taken an advanced position in regard to taxation. The colonial property tax consists solely of a progressive land tax. The system exempts small farmers entirely. Local communities have the privilege also of restricting tax levies to their land values. There is a progressive income tax. New Zealand has created the office of public trustee, whose incumbent has care of intestate estates, certain private trust estates, etc. Any property-owner has the right of appointing him executor. A local option law provides that licensed liquor houses may be abolished by a vote of three to two in any district, and that the number of them must be reduced if demanded by a majority of the electors. The question is voted upon every three years.

POPULATION. The population of New Zealand (exclusive of Maoris) increased from 79,711 in 1860 to 626,050 in 1890, and to 772,719 in 1901, the density of population being 7.39 to the square mile. The males numbered 405,992, females 366,727. Since 1841 the per cent. of increase has exceeded that of Australia for every decade except 1881-91. In the decade 1891-1900 the excess of arrivals over departures was 27,211. The population of North Island slightly outnumbers that of South Island. The population is quite homogeneous, being almost wholly from the United Kingdom. There are,

however, not a few Germans and Scandinavians. The immigration of colored races has been checked by restrictive governmental measures. The Chinese have decreased in number and were only 2792 in 1901. The Maoris have decreased from 70,000 (estimated) in 1840 to 46,518 in 1901, including 5762 half-castes, but the decrease seems to have been checked. The natives are allowed, within limitations, to manage and dispose of their land (about 5,000,000 acres), and they have a measure of local self-government. They welcome the advantages of education for their children and engage to some extent in agriculture. The population of the largest cities in 1901 was as follows: Auckland, 34,213, with suburbs, 67,226; Wellington, the capital, 43,638, with suburbs, 49,344; Christchurch, 17,538, with suburbs, 57,041; Dunedin, 24,879, with suburbs, 52,390.

RELIGION. The principal churches are the Church of England, predominating in Canterbury; the Presbyterian, which dominates in Otago and Southland; the Wesleyan and the Roman Catholic.

EDUCATION. The public system of education is in charge of a Government department, with a minister at its head. School attendance is compulsory between the ages of seven and thirteen. The schools are secular and the primary grades are free, small fees being charged for secondary courses. In 1900 there were 132,897 pupils enrolled at the State schools. Of them, 107,912 were in average attendance. There were in the same year 15,550 pupils enrolled in private schools, mainly Roman Catholic. The Government maintains 85 village schools, which had an attendance of 3109. Besides a number of art schools, there are mining, agricultural, and engineering institutions. In 1900-01 the Government expended £481,087 on education. The New Zealand University is an examining body, which has five affiliated colleges located respectively at Dunedin, Christchurch, Auckland, Wellington, and Canterbury. Each of these has the advantage of land grants, the income from which is annually supplemented by colonial grants.

HISTORY. New Zealand was discovered by Tasman in December, 1642. In October, 1769, Captain Cook landed at Poverty Bay, and in 1773 and 1777 explored the shores of the islands. The period before European colonization was characterized by fierce wars among the native tribes, marked by extensive conquests on the part of the celebrated chieftain Hongi (1820-28). In 1814 Rev. Samuel Marsden established a mission in the Bay of Islands. Other missionaries rapidly followed, and the natives were speedily converted to the outward forms of Christianity. A British resident was appointed at the Bay of Islands in 1833, and in the following year British troops were employed against the natives. In September, 1839, an expedition, under the auspices of the New Zealand Company, arrived at Port Nicholson, the first body of immigrants reaching that place in January of the following year. In February a number of native chiefs, in the Treaty of Waitangi, placed themselves under the authority of the British Government, and in May the sovereignty of Great Britain over the islands was proclaimed. Colonization was rapid and the alienation of the Maori lands proceeded steadily. In 1850 the New Zealand Company surrendered all of its interests in the colony to

the British Government, and in 1853 a constitutional act was promulgated for the colony, the first representative assembly being opened in 1855. From 1860 to 1866 there were formidable native uprisings, and spasmodic outbreaks did not cease until about 1870. Since that date the relations with the native population have been almost uniformly peaceful, and the Maoris have made rapid strides in civilization, attaining even a share in the government. In 1870 an act was passed establishing the New Zealand University. About this time, too, occurs the first beginnings of the policy of State participation in economic affairs, with the commencement of railway construction under public supervision in 1871, and the establishment of a Public Trust Office in 1872. An educational act providing for the free and compulsory instruction of all children was passed in 1876. In 1879 a measure was enacted looking toward the establishment of manhood suffrage, although the one-man one-vote principle was not in complete operation until 1890. In September, 1893, the franchise was extended to women.

The movement toward State socialism came prominently to the front in 1890, in which year the labor element exercised an important influence on the elections to the General Assembly. Since that year the progress in that direction has been rapid. Numerous labor laws have been passed, looking toward the amelioration of the condition of the working classes, while land legislation has been carried on with a view of bringing the soil into the possession of small owners. Thus, in accordance with an act of 1892, large areas of Government land have been leased in perpetuity to small tenants, the right of purchase being denied. In the same year the Government was authorized to acquire land for the purpose of settlement, and in 1894 this power of the Government was made compulsory. In the same year an act was passed authorizing Government loans to farmers on mortgage; in 1895 a Family Homes Protection Act prohibited homesteads from being mortgaged or sold for debt. As early as 1891 the property tax had been repealed, and a graduated tax on incomes and unimproved land values substituted, the income tax not being levied on incomes derived from land. Labor legislation culminated in the Industrial Conciliation and Arbitration Act of August 31, 1894, by which disputes between employers and employees were subjected to the decision of State tribunals. In 1898 an Old Age Pensions Bill was passed. In 1900 a form of workmen's accident insurance was adopted. New Zealand rendered loyal support to the British Empire in the South African War, its mounted contingents constituting a very useful part of the British forces.

NEW ZEALAND FLAX. See FLAX, NEW ZEALAND.

NEW ZEALAND SUBREGION. In the Scater-Wallace system of zoögeography, a subregion of the Australian Province, including New Zealand and all the surrounding islands south of New Caledonia. Its faunal characteristics are delineated in the article NEW ZEALAND, paragraph *Fauna*. Other views have been held in regard to the faunal relations of this isolated archipelago. Huxley made it a primary subdivision of his hemispherical region 'Notogæa' (q.v.). Recent zoölogists have been inclined to consider its features so distinct as to elevate it to primary rank and make it a full 'region,' co-ordinate with the Australian and other 'provinces.' See DISTRIBUTION OF ANIMALS.

NEXT FRIEND. An adult person, other than a guardian *ad litem*, who represents in an action another person who, by reason of infancy or other disability, is not legally competent to maintain the suit in his own behalf. The practice of permitting an incompetent person to sue by his next friend originated in England, where it was first authorized by the 'Statute of Westminster' passed in the reign of Edward I. Previous to that time an action in favor of an infant or other incompetent person could only be conducted by his regularly appointed guardian. The Norman-French term *prochein ami*, of which 'next friend' is the English equivalent, was employed in the above statute, and continues in use in many jurisdictions to-day. There is very little difference between the functions of a guardian *ad litem* and a person who sues as next friend, except that the latter usually represents a plaintiff, and in some jurisdictions the former is only appointed to represent a defendant.

A next friend is not a party to an action, but acts solely in a representative and advisory capacity. It follows, therefore, that most of the rules governing parties, as that the admissions of a party bind him, etc., do not apply to a next friend. He is, however, subject to such rules as relate to the conduct of the case. A next friend is considered as an officer of the court where he is appointed to protect the interests of an incompetent defendant. In some States where an infant is otherwise represented by a guardian, he may sue by a next friend to compel an accounting by the guardian where there is reason to believe that the latter is guilty of a breach of trust. In a few jurisdictions married women and persons of unsound mind may sue by a next friend. Usually, however, lunatics and

those who are mentally incompetent are represented by committees or guardians. An action commenced by a next friend cannot be discontinued or settled without the consent of the court. A next friend only represents the incompetent during the litigation, which, however, is not considered as ended until an appeal is determined or the right to appeal has expired. See COMMITTEE; GUARDIAN; INFANT; LUNATIC; MARRIED WOMEN; PARTIES; and authorities where referred to under these titles.

NEY, ná, MICHEL, Duke of Elchingen and Prince of the Moskva (1769-1815). One of Napoleon's most celebrated marshals. He was born January 10, 1769, at Saarlouis, the son of a poor cooper. He had but little education and worked as clerk to a notary and as foreman in a mine until 1788, when he joined a hussar regiment at Metz. He made the campaign of 1792 with the Army of the North and rose to be lieutenant. In April, 1794, he became captain in the Army of the Sambre and Meuse, and distinguished himself by his energy and his cool intrepidity. He was wounded at the siege of Mainz, fought bravely in 1795 at Altenkirchen, and for his services in storming the citadel of Würzburg and forcing the passage of the Rednitz was made in 1796 brigadier-general. His capture of Mannheim (March 28, 1799) gained him the rank of general of division, and after being severely wounded at Winterthur in May, he was placed in September in temporary command over the Army of the Rhine, and carried on a skillful game of strategy against the Archduke Charles of Austria, whom he prevented from uniting with Suvaroff against Masséna. He fought subsequently under Lecourbe and Moreau at Engen, Mooskirch, and Hohenlinden. Ney's republican principles could not withstand the blandishments of Napoleon, who persuaded him to marry, in 1802, Mlle. Auguié, a friend of Hortense Beauharnais, made him inspector-general of cavalry, and sent him on a diplomatic mission to Switzerland, where he brought about the Act of Mediation of February, 1803. In the same year he received command of the Sixth Corps of the Grand Army raised for the invasion of England, but soon to be turned against Austria. In 1804 he was made a marshal of the Empire. In the following year he defeated the Austrians at Glinzburg (October 9th) and by his successful assault on the intrenchments of Elchingen brought about the capitulation of Ulm and gained for himself the ducal title (conferred in 1808). He fought at Jena in 1806, reduced the cities of Erfurt, Magdeburg, and Thorn, and by his timely arrival on the battlefield of Eylau (q.v.) prevented a possible defeat for the French. On June 14, 1807, Ney took the village of Friedland from the Russians after a bloody combat, and thus decided the outcome of the battle. He now became the idol of the army, while Napoleon bestowed on him the title of *Brave des braves*. In 1808 he was sent with the Sixth Corps to Spain. He overran Galicia, maintained an energetic warfare against the Spanish guerrillas, and added to his reputation for audacity and skill. In 1810 he was placed under the command of Masséna, to whom was intrusted the invasion of Portugal. Ney resented what he conceived a slight toward himself, and, though he fought with splendid courage on the retreat from Torres Vedras as commander of the rear guard (one of the greatest

incidents in his career), he was guilty of gross insubordination, and in March, 1811, returned to France in semi-disgrace. His talents, however, made him invaluable, and in the Russian campaign (1812) he held command of the Third Corps. He distinguished himself at Smolensk and commanded the centre at Borodino (q.v.), where his efforts achieved the victory, his services being rewarded with the title of Prince of the Moskva. He commanded the rear guard on the retreat from Moscow, and by vigorous discipline and devoted heroism saved the remnants of the Grand Army from utter disorganization, notably at the disastrous passage of the Berezina. In the campaign of 1813 he won a victory over the Allies at Weissenfels (May 1, 1813), fought at Lützen and Bautzen in May, but was defeated by Bülow at Dennewitz (September 6th). He held the left of the French line in the battles around Leipzig and was with Napoleon in the defensive campaign of 1814 in France. After the taking of Paris by the Allies he insisted on Napoleon's abdication and hastened to offer his services to the Bourbons. He was made a peer of France, and a member of the council of war, and was placed in charge of the sixth military division. On news of Napoleon's return from Elba he was ordered to Besançon to resist the Emperor's advance, but on the night of March 13th he went over to Napoleon, summoning his troops to follow him, and on the 17th he joined the Emperor at Auxerre, moved to this act, no doubt, by the magic influence of his old commander, but influenced too by the humiliations to which he had been subjected by the returned nobles of the old régime. At the head of the First and Second Corps of the new army raised by Napoleon, he fought on June 16th at Quatrebras (q.v.), and led the last charge of the Old Guard at Waterloo. After the battle he returned to Paris and advocated the recall of the Bourbons. Proscribed on July 24th, he remained in hiding in the country till August 5th, when he was discovered and brought to Paris and arraigned (December 5th) before a court-martial containing many of his old companions in arms. The court declared Ney out of its jurisdiction as a peer of France, and handed him over to the Chamber of Peers, which on December 6, 1815, by 139 votes against 17 found him guilty of treason and condemned him to death. He was shot the following day in the gardens of the Luxembourg. Consult: Dumoulin, *Histoire complète du procès du maréchal Ney* (Paris, 1815); Rouval, *Vie du maréchal Ney* (ib., 1833); Welschinger, *Le maréchal Ney, 1815* (ib., 1893).

NEZHIN, nyé'zhén, or **NEJIN**. A town in the Government of Tchernigov, Little Russia, situated on the Oster, about 80 miles northeast of Kiev. It has a philological institute, a gymnasium, and a Greek school. It is noted for the tobacco cultivated in its vicinity. Vegetables and fruit are also important products. The trade, formerly of great extent, has decreased since the rise of Taganrog and Rostov-on-the-Don. It was under Chmielnicki, in the seventeenth century, that Greek merchants settled at Nezhin, where they received special privileges. Population, in 1897, 32,100, including a number of Greeks.

NEZ PERCÉ, ná par'sá'. The leading tribe of Shahaptian stock (q.v.). They call them-

selves *Shaptin*, whence the stock name, but they were known as *Chopunnish* to some of the neighboring tribes, and were called *Nez-percé*, 'Pierced Nose,' by the French, in allusion to their former custom of wearing nose pendants. They formerly claimed a large territory in eastern Washington and Oregon and central Idaho, bounded on the east by the main divide of the Bitter Root Mountains and including the lower Grande Ronde and Salmon rivers, with a large part of the Snake and all of the Clearwater River districts.

Lewis and Clark traversed their country in 1805. In 1832 they sent a delegation to Saint Louis to ask for Christian missionaries and teachers. In response to their request a Protestant mission was established among them at Lapwai, Idaho, in 1837. Soon afterwards they entered into governmental relations, and they made their first treaty with the United States in 1855. By this they ceded the greater portion of their territory and were confirmed in the possession of a reservation including Wallowa Valley in Oregon. On the discovery of gold in the country, however, the miners rushed in, and in consequence a new treaty was forced upon the Indians by which they agreed to surrender all but a reservation at Lapwai in Idaho. Joseph, who occupied Wallowa Valley with his band, refused to recognize the treaty or remove to Lapwai. This refusal led to the Nez Percé War in 1877, in which, under Joseph's leadership, several severe defeats were inflicted upon successive detachments of regular troops. Joseph finally almost accomplished a masterly retreat toward Canada through Idaho and Montana, which was frustrated only by the arrival of Colonel (General) Miles, when the Indians were within 50 miles of the British line. Joseph surrendered on assurance of being allowed to return to his own country, but the promise was not kept. He and his band were deported to the Indian Territory, where in seven years they were reduced by disease from about 450 to 280. Their condition compelled attention, and in 1884 they were returned to the north, not however, to their old country, but to the Colville reservation in northern Washington, where they now reside. From an estimated total population of 2800 in 1863 the tribe has decreased to less than 1700, of whom about 1570 are on the (allotted) Lapwai agency, in northwestern Idaho, the rest under Joseph being at Colville, Wash. The general report of conditions in either band is not encouraging. Consult Mooney, "Ghost Dance Religion," in *Fourteenth Annual Report of the Bureau of Ethnology* (Washington, 1896). See Plate of AMERICAN INDIANS, under INDIANS, AMERICAN.

NGAMI, n'gá'mé, LAKE. A lake in South-Central Africa, situated in Western Rhodesia, north of the Kalahari Desert (Map: Africa, G 7). It is one of the last remnants of the great inland sea which formerly seems to have occupied the vast lacustrine basin of which the Kalahari is a part. A gradual desiccation is still going on in this region, and Lake Ngami has diminished considerably since it was discovered by Livingstone in 1849. It is now little more than a marsh in the dry season, while during floods it may reach the dimensions of 10 by 30 miles. It receives the waters of the Kubanga, and discharges periodically eastward into the Makarikari Salt Basin.

NGAN-HWEI, n'gán'hwá'è (Chin., peace, plenty). One of the eastern provinces of China, bounded on the north by the Province of Kiang-su, on the east by Kiang-su and Che-kiang, on the south by Kiang-si, and on the west by Hu-peh and Ho-nan (Map: China, E 5). Its area is estimated at from 53,000 to 55,000 square miles. It is divided into three parts, the hilly region in the south around Hwei-chow and Ning-kwoh with the Tsien-tang River, the central plain of the Yang-tse, and the northern part, drained by the River Hwai. The southern districts are famed for climate, fertility, and productions. The staples are fruits, cotton, hemp, silk, and iron. The numerous streams are used for navigation and for irrigation, their control showing great engineering ability. The province contains some of the most productive and beautiful parts of the Empire and is under a high state of cultivation. It suffered greatly in the Tai-ping rebellion, losing nearly half its population. Its present population is estimated at over 20,000,000. Capital, Ngan-king-fu (q.v.).

NGAN-KING-FU, n'gán'king'fóó'. The capital of the Province of Ngan-hwei (q.v.), China, situated on the Yang-tse river, about 175 miles east of Hankow (Map: China, E 5). It still shows traces of its occupation during the Tai-ping Rebellion. It was opened to foreign trade in 1897. Its population is estimated at 40,000.

NGORNU, n'gór'nóó, or **ANGORNU**, áng-ór'-nóó. A town of Bornu, Central Africa, on the southwest bank of Lake Chad, 15 miles southeast of Kuka. Owing to its low position, the town is occasionally flooded by the rising waters of the lake. Ngornu is an important commercial place and through its fairs an extensive trade is carried on in cotton, amber, and metals. Its population is estimated at from 20,000 to 50,000.

NIAGARA, BATTLE OF. See LUNDY'S LAKE, BATTLE OF.

NIAGARA FALLS. See NIAGARA RIVER AND FALLS.

NIAGARA FALLS. A city in Niagara County, N. Y., 22 miles north by west of Buffalo; on the Niagara River, and on the Erie, the Michigan Central, the Lehigh Valley, the New York Central and Hudson River, the West Shore, the Grand Trunk, and the Wabash railroads (Map: New York, B 2). It is the seat of Niagara University (Roman Catholic), opened in 1856, and De Veaux College (Protestant Episcopal), and has a public library, for which a \$50,000 building was given by Andrew Carnegie. The New York State Reservation here, which includes Prospect Park, is 107 acres in extent; and there are three notable bridges connecting with Canada, one cantilever and two steel arch bridges. (See BRIDGE.) The vicinity possesses much of historic interest. Niagara Falls has long been noted as the foremost scenic resort of America. It is developing also into an important manufacturing centre, its growth being due to the utilization of the extraordinary power of the Niagara River and Falls (q.v.). Among the industrial establishments are flour and paper mills, planing mills, a foundry and machine-shop, a plant for the production of wheat biscuit, aluminum, carbide, and carborundum works, and electro-chemical works. Niagara Falls was chartered as a city in 1892, the former villages of Niagara Falls

and Suspension Bridge being consolidated. The government, under the original charter, is vested in a mayor, elected biennially, and a common council, and in administrative officers who are appointed by the mayor. The water-works are owned and operated by the municipality. Population, in 1900, 19,457.

NIAGARA FALLS, formerly CLIFTON, or SUSPENSION BRIDGE. A town of Welland County, Ontario, Can., on the west bank of Niagara River, below the falls, 20 miles northwest of Buffalo. It is opposite Niagara Falls City, U. S., with which it is connected by three bridges and electric railways, and is the junction of the main lines of railways entering that city with the Grand Trunk Line of Canada. Its chief features are Wesley Park and Queen Victoria Niagara Falls Park, which covers an area of 154 acres, extends along the river for two and a half miles, and commands the finest views of the falls. Extensive works similar to those on the United States side are in course of construction to utilize the water power. Population, in 1901, 4244.

NIAGARA-ON-THE-LAKE. A town in Lincoln County, Ontario, Can., on Lake Ontario, at the mouth of the River Niagara, 36 miles distant by water from Toronto (Map: Ontario, D 4). Burned down in December, 1813, by the American General McClure on his retreat, it was rebuilt, and is known as a summer and pleasure resort with good bathing, boating, and fishing. Population, in 1901, 1258.

NIAGARA RIVER AND FALLS (Iroquois *Jorakare*, thundering water). The Niagara River flows from Lake Erie to Lake Ontario, and is the outlet for the whole drainage of lakes Superior, Huron, Michigan, Saint Clair, and Erie. The surface of Erie, where the river begins, is 326 feet higher than the level of Ontario, where it ends. The water is clear and pure. The river is 33 miles long, its general direction is from south to north, and it forms the boundary between New York State and the Canadian Province of Ontario. The volume of water which enters Niagara is 280,000 cubic feet a second. In its upper course it is very wide (below Grand Island from 2½ to 3 miles); just above Niagara Falls it is less than a mile in width, and below the falls it rushes headlong through a deep and narrow gorge to the cliff at Lewiston, where it emerges on the plain of Lake Ontario, and is again a broad and peaceful river.

As it emerges from Lake Erie and enters the plain, it is crossed by a low ridge of rock, in passing which the river is swift and troubled for about two miles. Then it is smooth again, flows slowly over the plateau, has an average depth of 25 feet, and its surface is interspersed with many small islands. For nearly three-fourths of its length it cannot be said to have a valley, for it flows upon the surface of the plateau, and its fall from the lake to the rapids above the cataract is only 20 feet. Then a sudden and complete change in its aspect occurs. It is dropped by the short rapids beginning a little above Goat Island 52 feet, which is the prelude to the fall over the majestic cataract, where it plunges 160 feet down into the plain, a total descent of 212 feet from the head of the rapids. At the foot of the American Falls there is no great depth of water, massive and broken rock in the bed having prevented the deep excavation

that would otherwise occur; but the enormous mass of water, 20 feet deep at the centre and about nine-tenths of the whole volume, which thunders over the Canadian or Horseshoe Falls, has excavated a basin extending from shore to shore for 1½ miles below the falls that is fully as deep as the height of the falls. The effect of this deep basin or reservoir is to retard and smooth the waters so far that rowboats cross the river and the little steamer *Maid of the Mist* is able to approach the cataract. The basin is succeeded by the narrow gorge which continues to Lewiston, its width rarely equaling one-fourth of a mile, and its depth to the bottom of the river varying from 200 to 500 feet. Its walls are so steep that they can be climbed only at a few places, and they reveal the geologic structure of the plateau—the bedded rocks of limestone, shale, and sandstone lying almost horizontally. The fall of the river in the gorge, seven miles long, is about 100 feet. The confined waters pour tumultuously along at an estimated speed of 30 miles an hour, and the terrific onrush and battle of the waters make a spectacle that is equal to that of the falls themselves. About midway in the gorge the channel makes an abrupt, short turn to the left, and here the onslaught of the torrent has worn out a vast circular basin forming the celebrated Whirlpool. From the Whirlpool the channel is broader and less steep. The plateau ends abruptly at Lewiston, and its edge, where it steeply descends to the littoral plain of Ontario, is marked by a long escarpment parallel with the shores of the lake, known to geologists as the Niagara Escarpment, which rises to about 260 feet above the level of Ontario. The last seven miles of the journey is over the littoral plain with a fall of only about three feet.

The position of Niagara Falls marks the present extension of the work of the river in cutting this great gorge. It is not known by what channel or channels Lake Erie may have discharged its waters in pre-glacial times; but geologists have proved that the Niagara River began its existence during the final retreat of the great ice sheet; in other words, most students of glacial geology agree that the history of the river covers only a small part of the period since the beginning of the age of ice.

The great work of the river has been in excavating the gorge from Lewiston back to the present position of the cataract. The falls first poured over the edge of the escarpment at Lewiston and began to dig their way back through hard limestone and sandstone, interbedded with a coherent though softer shale, and for a part of the distance the material was incoherent drift. The process of excavation may be observed at the falls. The rocks lie in layers and the upper covering of loose drift yields readily to the wash of the waters. Under the drift is hard limestone, called the Niagara limestone, 80 feet in thickness; beneath the limestone lies the softer Niagara shale, with a thickness of 50 feet; then for 35 feet is the Clinton group, an alternation of limestone, shale, and sandstone, the whole resting upon a bed several hundred feet in thickness of soft sandy shale, which is not known to be interrupted except by a single hard layer of sandstone from 10 to 20 feet thick. These shales and sandstone are called the Medina formation. The hard top layer of limestone

projects like a shelf over the edge of the falls so that the water leaps from it and strikes the surface of the pool below. Now and then large blocks of the upper limestone break away and fall into the pool, due doubtless to the erosion of the softer shale beneath, the limestone thus being deprived of its support. Just how the shale is eroded, and how the harder rock beneath it is affected, is in doubt. It is observed in the Cave of the Winds, where visitors may pass behind one of the thinner segments of the falls, that spray and water are constantly dashing against the shale and probably wear it away. The shale is also calcareous, and this element in it being soluble, it is likely that solution has a part in the work of destruction. As the water contains no sediment, the Niagara River cannot use this agency, as most rivers do, to scour out its bed; but the broken pieces of rock that fall into the river below the cataract are undoubtedly potent in digging out and deepening the channel. Government engineers have discovered depths of 200 feet a half mile below the falls, and Gilbert and other geologists assume that the falls are scouring the river bed as deeply now as they did when they were situated farther down the stream. This is occurring in front of the Horseshoe Falls, but not at the American Falls, where the volume of water is comparatively small. The broken rock here piles up as a talus at the foot of the fall, and upon it the force of the descending water is spent.

The edge of the American Falls is retreating much less rapidly than that of the Horseshoe Falls. The average annual recession on the American side has been only about a half foot for the past fifty years; but the Horseshoe Falls have receded in fifty-two years from 150 to 230 feet along the western half of its edge, and 270 feet at the apex of its curve, making a recession of from four to six feet a year. If this rate of recession were constant, the proof would be conclusive that the gorge, from the Niagara escarpment to the falls of to-day, had been excavated in about 7000 years. But the thickness of the resistant bed at the crest of the falls is far from uniform; and there is evidence that at one period after the retreat of the ice the upper lakes found outlets through other rivers, and only Lake Erie was drained by the Niagara, whose small volume of water then must have been greatly inferior to that of to-day in its ability to excavate the gorge. The assured fact is that the gorge is gradually being cut back toward Lake Erie.

About a half mile above the brink of the falls, Goat Island divides the river into two unequal streams, the one on the American side being comparatively shallow and narrow, and discharging over the American Falls, while most of the river swings around to the left of Goat Island and discharges over the Horseshoe or Canadian Falls. The resemblance of the outline of these falls to a horseshoe has been destroyed by the more rapid recession of the central part of the cataract edge. The American Falls are 1060 feet wide, and the water is very shallow as it plunges over the edge, falling 167 feet. The Horseshoe Falls have a total width of 3010 feet, measured along the curve, or 1230 across the chord, a maximum estimated depth of 20 feet, and a vertical height of 158 feet. As the water is derived from the immense reservoirs of the

lakes, there is little variation in the quantity, the differences in volume depending not so much upon precipitation as upon the strong winds which slightly retard or accelerate the movement of the surface waters of Lake Erie to the mouth of the river. The normal flow pouring over the cataract is about 500,000 tons a minute.

The falls, being one of the great scenic attractions of the world, are visited every year by many thousands of tourists. From the time when Father Hennepin discovered them in 1678, and wildly estimated that they were over 500 feet in height, they have never been adequately described. A realizing sense of the grandeur of this prodigious green flood pouring into an abyss where it is half lost in the masses of ascending mist can be obtained only by personal observation. Sightseeing has been greatly facilitated, and visitors protected from imposition since 1885, by the conversion of the land on both sides of the falls into public parks. The New York State Reservation contains 107 acres, and the Queen Victoria Niagara Falls Park on the Canadian side 154 acres. Since these banks became Government properties, the mean industrial structures that marred them have been torn down, and the wonderful spectacle may now be enjoyed at leisure from shady avenues, artificial platforms, and other advantageous points of view. Trains on the Canadian side wait for a few minutes to give the passengers a glimpse of the vast sheet of water curving over the Horseshoe Falls. An electric trolley line has been built through the gorge along the brink of the river on the American side and connects by the Queens-town bridge with the electric line skirting the Canadian heights along the gorge and extending past the Horseshoe Falls to Chippawa; a railroad also skirts the United States edge of the gorge, so that visitors may see its entire length and take in the terrific features of the rapids and the whirlpool. Many visitors enter the Cave of the Winds, approach the falls on the steamer *Maid of the Mist*, or enjoy the superb general view from the middle of the upper arch bridge or the high terrace below the Horseshoe Falls on the Canadian side. Several days are required even for a cursory examination of all the attractions of the place. The bridge thrown across the river a little below the falls was long regarded as a wonder of engineering. This suspension bridge for pedestrians and carriages, built of steel about 250 yards below the American Falls, had a span of 821 feet. It has been replaced by an arch bridge. The cantilever, 910 feet long, spanning the gorge some distance above the Whirlpool, was the first bridge of the kind to be built in America; the railroad steel arch bridge, 300 feet below the cantilever, has a carriageway below the track.

It is only in recent years that important attempts have been made to utilize the energy of Niagara Falls for industrial purposes. The largest plant is that of a power company which generates electricity by leading water through a canal from above the falls to a wheel pit in which are turbines, the water discharging through a tunnel into the river below the falls. Many industries at the falls are using the electricity, and Buffalo, 22 miles distant, takes it for its city railroads and other power purposes. Over three-fourths of the power generated, however, is consumed in the neighborhood of the falls.

**NIAGARA FALLS
FROM THE AMERICAN SIDE**

BIBLIOGRAPHY. Holley, *History of the Falls of Niagara* (New York, 1882); Harrison, *The Condition of Niagara Falls* (ib., 1882); Gilbert, "The History of the Niagara River," in *Smithsonian Report for 1890* (Washington); id., *Niagara Falls and Their History* (New York, 1895); *The Niagara Book*, by several authors (Buffalo, 1893); Grabau, *Guide to the Geology and Paleontology of Niagara* (New York, 1901); also Kibbe's account of the various surveys and maps of the falls in the *Seventh Annual Report of the commissioners of the New York State Reservation at Niagara* (Albany, 1891).

NIAGARA SERIES. The lowest division of the Upper Silurian (or Silurian) system of rocks. It is made up of a series of sandstones, limestones, and shales, which are grouped together under the Medina, Clinton, and Niagara stages. The rocks of the Niagara series are found in central and eastern New York, and extend southward through Ohio, Pennsylvania, Virginia, eastern Kentucky, and Tennessee, and westward through Illinois, Missouri, and Iowa. They are also known westward in Illinois, Wisconsin, and Indiana. Many of the beds are very persistent. The Oneida conglomerate at the base forms the bold scenery of the Shawangunk Mountains, in New York; the Clinton division carries a bed of red hematite iron ore which is found from New York to Birmingham, Ala., where it forms the basis of a large steel industry. The limestone and shale of the Niagara epoch are seen at Niagara Falls, where it is the undermining of the limestone, due to the wearing away of the shale, which has caused the falls. Fossils are found in great abundance in most of the rocks. See SILURIAN SYSTEM; CLINTON STAGE.

NIAM NIAM, nâ-âm' nê-âm', or ZANDEH. A numerous people of Negro-Hamite blood on the Nile-Congo-Chad water-shed north of the Welle River, Southeastern Sudan, between 4° and 7° north latitude and 25° and 29° east longitude. They are negroes, brachycephalic, muscular, of medium height, and brown color. They are noted for their cannibalism. Their houses are conical, with clay walls and thatched roofs; the kitchen hut and sleeping hut for boys form part of the dwelling group. They are hunters and agriculturists, excel in textile work and handicraft in clay, wood, and iron, and play on a five-stringed harp. They fight with throwing knives, swords, assegais, clubs, and shields. Numbering over two millions, they are divided into small sovereignties, partly independent, partly under the Congo Free State. Consult: Stanford, *Africa* (London, 1895); Deniker, *Races of Man* (London, 1900).

NIANTIC, or NEHANTIC. A small Algonquian tribe, formerly occupying the southwestern coast of Rhode Island, adjoining the Narraganset (q.v.), who claimed dominion over them. Their principal village was at Fort Neck, on the Great Pond in Charlestown. By refusing to join the hostiles in King Philip's War of 1675-76, they were able to preserve their territory and tribal organization, and at the close of the war the Narraganset who submitted to the English were settled with the Niantic, and the whole body thenceforth took the name of Narraganset. A detached body, supposed to have been cut off from the main tribe by an invasion

of the Pequot, resided on Niantic Bay, in Connecticut. They were subject to the Pequot, and with them were nearly destroyed in the war of 1637, the few survivors gradually wasting away by emigration and disease until none were left in the original territory. The present Narraganset of Rhode Island are chiefly of Niantic descent, so far as their Indian blood is concerned.

NIAS, nê'âs'. An island in the Indian Ocean, belonging to the Netherlands, and situated 65 miles from the west coast of Sumatra (Map: Australasia, B 2). It is 65 miles long, 20 miles wide, and has an area of about 1800 square miles. It is mountainous and surrounded by coral reefs, and the soil is very fertile, the chief products being rice, sugar, and pepper, the latter amounting to over 100,000 pounds annually. The inhabitants, whose number is estimated at 200,000, are a Malay people closely akin to the Battaks. They are somewhat lighter in color of skin than many of the Malayan tribes, and are sometimes classed as Indonesians. In head-form they tend toward dolichocephaly. The island has suffered much from intertribal wars, and the slave trade continued here with unusual persistency. Consult: Modigliano, *Un viaggio a Nias* (Milan, 1890); Sundermann, "Kleine niassische Chrestomathie," in *Bijdragen voor de taal- land- en volkenkunde van Nederlandsch Indie*, ser. v., vol. vii. ('sGravenhage, 1892); id., *Kurzgefasste niassische Grammatik* (Müra, 1892); id., *Deutsch-niassisches Wörterbuch* (ib., 1892).

NIATA, nyk'tâ, or **NATA**, nê'tâ. A breed of deformed cattle, long existent in Argentina, but now very rare. These animals greatly interested Darwin as an example of a variation, believed to have originated early in the eighteenth century among the Patagonian Indians, and to have remained constant for a long period. They have very short, broad foreheads, upturned noses, lips withdrawn, showing the teeth, and a ludicrous facial resemblance to pug dogs. They are remarkable for 'breeding true,' and the amount of influence exerted on the hybrid offspring when crossed with other cattle. Consult Darwin, *A Naturalist's Voyage* (London, 3d ed., 1860; New York reprint, 1899). Compare PREPOTENCY.

NIBELUNGEN, RING DES. See RING OF THE NIBELUNGEN.

NIBELUNGENLIED, nê-be-lung'en-lêt' (Ger., Song of the Nibelungs). A great German epic, composed by an unknown poet on the basis of earlier German songs, traditions, and possibly Latin poems, at the beginning of the thirteenth century. The original form of the poem is probably in none of the ten complete MSS., but that known as B seems closest to the original. A seems an abridgment, C an enlargement of B, and to one of these three types all the MSS. and fragments belong. The song falls into two parts, the first dealing with the wooing, marriage, and murder of Siegfried, the second with the vengeance of his widow, Kriemhild. The scene of the former is the Burgundian court of Gunther and his wife, Brunhilda, at Worms, of the latter the Hunnish court of Etzel or Attila; but both parts appear to have got their present form among the Franks, whence the legends spread over Germany and to Scandinavia, where we find them much modified in the *Edda* and the *Thidreksaga*. The outline of

the story is this: Siegfried, King of the Nibelungs in Nether Germany, woos Kriemhild, sister of the Burgundian King Gunther, for whom he procures to wife Brunhilda, Queen of Iceland, by wearing a magic cloak, and is rewarded with Kriemhild's hand. Brunhilda discovers the deception and procures the murder of Siegfried by Hagen. To avenge herself, Kriemhild accepts the suit of Etzel and invites Gunther with his brothers and courtiers to visit her. Hagen perceives her intent, betrays the Nibelungen treasure in the Rhine, and, after vain efforts to dissuade the King, accompanies him. The Burgundians are attacked in a hall and all are finally killed, not without loss to Etzel of Kriemhild, of their son, and of all his warriors, save only Dietrich von Bern (Theodoric of Verona) and his companion, Hildebrand, hero of the *Hildebrandslied*. Then follows in all MSS. a *Lament* (*Die Klage*) older than the *Song* and also anonymous. The historical substratum of the legend is the defeat of the Burgundian King Gundahari by Attila in 437. Kriemhild seems identical with the girl Ildico (Hilde), who was with him at his death, according to Jordanes, but the actual Theodoric belongs to a later period, and if Siegfried be, as many have thought, identical with Arminius, he is more than four centuries earlier. Others regard Siegfried, with Brunhilda, as mythical. The poem derives such unity as it has from various forms of the conflicting claims of double allegiance. In Kriemhild there is the conflict between wife, sister, and mother; in Siegfried between husband and vassal; in Hagen between chivalric honor and allegiance; and in Rüdiger, Etzel's great vassal, between hospitality and loyalty. Thus in one form or another that faithfulness (*Treue*) that Heine said was the strongest characteristic of the German nation is the mainspring of tragic action. But the *Song* lacks unity of inner structure. Passages of deep feeling and pathos alternate not alone with those of fierce, rugged strength, but with others trivial, grotesque, or even, as in Gunther's wedding, downright burlesque. The episodes, too, are so inartistically welded that a school of critics, Lachmann at their head, even thought they could distinguish the elements of compilation; but this position is now generally abandoned. The history of the Nibelungenlied is not without interest. For centuries it was quite forgotten. Bodmer (q.v.) printed fragments of it in 1757, but it was received with indifference by scholars and with contempt by King Frederick II. The national spirit roused by the War of Liberation was more favorable to the legend. A soldiers' edition was printed in 1815, and in the next year Karl Lachmann published his epoch-making study. Since then the Nibelungenlied has grown steadily in scholastic and popular favor till its contents have become part of German literary consciousness. It has been the subject of critical studies by the Grimms, Müllenhoff, Zarneke, Bartsch, and Scherer; has been edited several times in its three versions, and well translated into modern German by Simrock, Bartsch, and Freytag. There are English versions by Lettsom (1850), Foster-Barham (1887), and Birch (1887).

BIBLIOGRAPHY. The history of the Nibelungen controversy is told in Fischer, *Die Forschungen über das Nibelungenlied seit K. Lachmann* (Leipzig, 1874). Consult, also, Muth, *Einlei-*

tung (Paderborn, 1877); Willmanns, *Beiträge zur Erklärung und Geschichte des Nibelungenlied* (Halle, 1877); Henning, *Nibelungenstudien* (ib., 1883); W. Grimm, *Die deutsche Heldensage*, 3d ed., by Steig (Gütersloh, 1890); Heintel, *Ueber die Nibelungensage* (Vienna, 1885); Müller, *Mythologie der deutschen Heldensage* (Heilbronn, 1886); Lichtenberger, *Le poème et la légende des Nibelungen* (Paris, 1891); and Gaston Paris, in *Poèmes et légendes du moyen âge* (ib., 1901). There is a poetical analysis in Carlyle's *Miscellaneous Essays*. The Nibelungenlied has furnished Jordan the material for his epic, *Die Nibelungen*, and Wagner the subject for the *Nibelungen Trilogy*, which has, however, more Norse than German elements. Siegfried plays a prominent part in other Middle High German epics, e.g. *Biterolf* and *Der Rosen Garten*.

NIBLO'S GARDEN. A former New York theatre on Broadway, near Prince Street, established in 1828 under the name of the Sans Souci, and later the property of William Niblo. It was famous as the home of the spectacular drama during the second half of the nineteenth century. It was twice burned and rebuilt, and was finally torn down in 1900.

NICÆA, ní-sē'a, or **NICE**, nēs (Gk. *Nίκη*, *Nikē*, *Nikala*, *Nikaia*, city of victory). A city of Bithynia, in Asia Minor, situated at the eastern end of Lake Ascania. It was built on the site of an older town by Antigonus (B.C. 316) and received the name of Antigoneia, which Lysimachus changed to Nicæa, in honor of his wife. It was a handsome town and of great importance in the time of the Roman and Byzantine emperors; all the streets crossed each other at right angles, and from a magnificent monument in the centre the four gates of the city were visible. It was early the residence of a Christian bishop, later of an archbishop. In 1078 it was captured by the Seljuks. In 1097 it was taken by the Crusaders. Theodore Lascaris (q.v.) made it the capital of his dominions in Asia Minor in 1206, and it remained the seat of an independent Greek State until 1261, when Michael Palæologus, Emperor of Nicæa, restored the Byzantine Empire. It fell into the power of the Osmanlis in 1326. Nicæa's chief importance in history is in connection with the two church councils held there. (See **NICÆA**, **COUNCILS OF**.) At the present time it is a small village called Isnik, with many interesting ruins. The church in which the council is said to have been held is now a mosque.

NICÆA, COUNCILS OF. Two ecumenical councils of the Christian Church, held at Nicæa in Bithynia. (1) The first was convened by the Emperor Constantine in 325 to settle the Arian controversy. Of some 1800 bishops in the Empire, 318 attended the council. The total number of delegates, including presbyters and others, was probably more than 1500. The eastern provinces were largely represented. Many of the members were venerable and illustrious men, among whom were Eusebius of Cæsarea, eminent for learning; Athanasius, then only a young deacon, attendant on the Bishop of Alexandria, small and insignificant in person, but conspicuous for intellect, eloquence, and zeal; Arius, a parish priest of Alexandria, 60 years old, tall and emaciated in person, wild, sometimes almost to madness, in manner ascetic, and negligent in dress, yet having a

sweet voice, and fascinating speech; Paphnutius, a martyr of the Upper Thebaid, whose right eye had been dug out with a sword, and the empty socket seared with a hot iron; Paul of Neo-Cæsarea, also a martyr, scarred by the brand of hot iron which had crippled both his hands; Jacob of Nisibis, who had spent years as a hermit in forests and caves, subsisting on plants and roots; Spiridion of Cyprus, continuing, even after his ordination, a literal shepherd; Hosius of Cordova, the ablest and best of the Western delegates; two Roman presbyters, influential as representing Pope Sylvester, who was kept at home by the infirmities of age; a Persian bishop from the eastern frontier, and a Gothic bishop from the north. Constantine's object in convening the council, as announced in his opening address, was to heal the divisions in the Church. At the opening of the discussions on the nature of Christ there seemed little prospect that the Emperor's prayer for harmony among the delegates would be answered. Accusations and recriminations were bandied to and fro without regard to his presence. The first sessions were devoted chiefly to a discussion of the Arian views, accompanied with an examination of Arius himself. He maintained that the Son of God was a creature, though indeed the most exalted of all; that He had been made out of nothing; that there was a time when He did not exist; and that, in His own free will, He was capable of right and wrong. The first attempt to reach a decision was made by producing an ancient creed of Palestine, the basis of that which was ultimately adopted, but opposed at first by the orthodox—the more violently because the Arians were willing to adopt it. A letter having been read from Eusebius of Nicomedia, in which he declared that to assert the Son to be uncreated would be to say that He was of one substance (*ὁμοούσιος*) with the Father, the expression was laid hold of as furnishing the very test for which they were seeking. For the confession of faith adopted at the end of the deliberations, see NICENE CREED.

Another controversy determined had reference to the time for observing Easter. The question was, Ought the Christian passover to be celebrated on the same day as the Jewish—the 14th day of the month Nisan—or on the following Sunday? On the one side were the apostolic traditions, and on the other the Catholic spirit seeking separation from Jewish ideas. At the date of the council the Judaic time was observed by the principal Eastern churches, and the Christian time by the Western churches, with a part of the Eastern. The decision was in favor of the Christian time. Some smaller matters also were decided by the council, and 20 canons passed on various subjects pertaining to morality and religion. For a minute and picturesque description of this council, consult: Stanley, *History of the Eastern Church* (London, 1861); also Boyle, *A Historical View of the Council of Nice, with a Translation of Documents*, in Cruse's translation of Eusebius (New York, 1856).

(2) The second council of Nicæa was convened in 786 by the Empress Irene and her son Constantine, dissolved because of the tumults raised by the image-breaking party, and reassembled the following year. Three hundred and seventy-five bishops attended from Greece, Thrace, the isles of the Archipelago, Sicily, and Italy. The council was occasioned by the Emperor's ill-

judged severity in forbidding the use of images for any purpose, and causing them everywhere to be removed and destroyed; and by the violent opposition to his course. For the history of this controversy, see IMAGE-WORSHIP.

NICANDER (Lat. from Gk. *Nikandros*, *Nikandros*). A Greek physician and poet, born at Colophon, in Asia, about B.C. 150. Of his numerous works only two poems are extant: the *Θηριακά* (nearly one thousand hexameter lines), on remedies against the wounds inflicted by venomous animals; and *Ἀλεξιφάρμακα* (more than six hundred hexameter lines), on poisons and their antidotes. Among his lost works was the *Ἑτεροούμια*, which is said to have been one of Ovid's sources for his *Metamorphoses*. He is frequently quoted by Pliny, Galen, and other ancient writers as an authority on all matters relating to toxicology. Consult the edition by Schneider, revised by Keil (Leipzig, 1856).

NICANDER, né-kän'dér, KARL AUGUST (1799-1839). A Swedish poet, born at Strengnäs. He studied at the University of Upsala. A prize from the Swedish Academy for his poem *Tassos död* (1826) gave him an opportunity to go to Italy (1827). After his return he lived in want almost to the day of his death. His earliest important poem was *Runesvärdet* (1821); this was followed by a collection of poems and tales, *Hesperider*, and the poem *Minnen från Söderm* (1831), containing his recollections of Italy, a land which appealed strongly to his imagination. His best poem, *Lejonet i öknen* (1838), is a eulogy of Napoleon. A collection of his poems appeared at Stockholm in 1839-41 (4 vols.; 5th ed. 1883).

NICARAGUA, né'ká-rá'gwá (from *Niquirao*, *Nicarao*, a Nahua tribe inhabiting the country in the sixteenth century). The largest of the Central American republics excepting Guatemala. It is bounded on the north by Honduras and on the south by Costa Rica. Its frontage on the Caribbean Sea is about 300 miles; that on the Pacific, 200 miles. It extends between latitudes 10° 41' and 15° N. and longitudes 83° 15' and 87° 40' W. (Map: Central America, E 4). Civilization is centred in the western third of the country. The settlements extend scarcely 100 miles inland from the Pacific. The wide Caribbean slope has no towns of importance excepting Bluefields and Greytown (San Juan del Norte). The low and hot Caribbean plain is under the influence of the moist trade winds which nurture the most luxuriant tropical vegetation. Almost impassable virgin forests, inhabited by scattered bands of Indians, spread from the western mountains to the Caribbean; but though this larger part of the country is rich in valuable timber and its higher lands contain the centres of gold-mining, it is the home of few white men. The higher and drier regions of the western mountain ranges with the plain between them are, on the other hand, adapted for planting and other industries, and have attained considerable development. The estimated area is about 49,000 square miles, about the same as that of Louisiana.

TOPOGRAPHY. The Caribbean coast is low and poorly supplied with harbors. It has three ports, none of them adapted for large ships. Greytown, in the delta of the San Juan River, formerly had a splendid harbor with 30 feet of water at low tide, but during a flood in 1855 the river

widened and deepened the Colorado branch of the delta so that most of the river now discharges south of Greytown in Costa Rica, leaving Greytown harbor, which has also been silted by the sea, very shallow. The port of Gracias a Dios is also shallow. Bluefields, on a large lagoon, is the most important east-coast port. The Pacific coast is high, and the water is deep close to the shore. The harbor of Corinto is one of the best-protected ports on the Pacific, and San Juan del Sur has a small but deep and safe harbor. Saint Andrews, Old Providence, and Great and Little Corn islands, near the Caribbean coast, are centres of banana and cocoanut growing.

Geographically Nicaragua is divided into distinct zones by two chains of mountains, which, more or less broken, and with numerous flanking spurs, traverse the Republic in a north-west and southeast direction parallel with the Pacific coast. The western or coast range is a part of the mountain system extending through most of Central America. In Nicaragua it is only ten to twenty miles from the Pacific, and its nearness to the ocean accounts for the fact that no considerable streams discharge from that slope into the Pacific. This western range, with the depressed plain lying between it and the eastern range, forms the principal line of volcanic energy and is marked by a number of extinct and active volcanoes built up by outpouring lava. None of them reaches 7000 feet above sea-level. Masaya (2972 feet) was violently active at different periods from the time of the Spanish Conquest until 1772, when a vast mass of lava was ejected from its crater, covering a tract of land eight miles long by two wide. It was dormant between 1861 and May, 1902, when it resumed activity. Coseguina (over 3000 feet) had a terrific eruption period in 1835, but has since been inactive. The Spaniards founded the city of Leon Viejo at the foot of Momotombo, but the eruption of 1609 so alarmed the citizens that they removed en masse 23 miles from the town they had founded and established new Leon on its present site. In recent years this volcano has ejected dust and scoria without inflicting damage. Other well-known volcanic summits are Telica, Las Pilas, Mombacho, Zapatera, Ometepe, etc. The severe earthquakes recorded in Nicaragua are associated with its volcanic phenomena.

The eastern range enters Nicaragua from Honduras and extends in a general southeastern direction to the coast north of the San Juan River, about 50 miles from its mouth. It sends out numerous spurs toward the Caribbean, between which flow the many rivers of the country. Between the eastern and western ranges lies the great interior basin, about 300 miles long and 100 miles wide, where the population and industries are in great part centred, chiefly near the west shores, or a little to the north and west of the two great lakes of the country. The dominating topographic features are thus the wide, low, rolling plain of the east, interspersed with mountains and spurs, and, toward the northwest, with highlands; the two cordilleras; the depressed plain between them with its two large lakes; and the steep, narrow Pacific slope.

HYDROGRAPHY. In the plain or basin between the ranges are two large lakes, Managua and Nicaragua, connected by the river Tipitapa and collecting the drainage of the basin, which has

an area of about 12,000 square miles. The larger lake, Nicaragua, comprises over 3000 square miles, and is 110 miles long. Its longer axis is parallel with the Pacific, from which it is only eleven miles distant at the nearest point. It is from 12 to 200 feet deep, with its surface about 106 feet above the sea-level. It receives the waters of the shallower Lake Managua (32 miles long by 16 wide). The waters of these lakes are carried to the Caribbean by the San Juan River, which has an average width of 1500 feet, and a minimum discharge of about 10,000 cubic feet per second. Its course is 120 miles, and it is navigable for small-draught steamers except at a few rapids, which offer obstruction in the dry season. The river has recently played little part in the commerce of the country, but in the construction of the Nicaragua Canal it was proposed to use its waters for many miles. The other rivers are mainly to the north of the San Juan, east of the mountain ranges, and drain the wide, forested plain. Most important among them are the Segovia or Wanks, about 300 miles in length, but with a narrow drainage basin, which does not carry a volume of water proportionate to its length; the Rio Grande, about 230 miles long, navigable for small vessels for 100 miles from the sea if a channel were cut through its bar; and the Bluefields River, navigable for 65 miles, its banks lined with banana plantations, whose crop is carried on the river to Bluefields for shipment to the United States. The Pacific coast rivers are unimportant.

CLIMATE. The climate is very warm, but not unhealthful, the prevailing trade winds mitigating the discomforts of the temperature, which varies little, seldom rising above 85° or falling below 70°. The seasons are divided into the wet and the dry, but on the Caribbean side they are not well defined, as rain falls nearly every day in the year. The precipitation at Greytown is 200-250 inches annually, while in the west, in the higher land, the precipitation is only 65-80 inches. The soil is very productive. On the Caribbean slope it is mainly reddish clay covered by leaf humus, and the cultivated regions of the west have a deep, black soil, in which fertilizing lavas and volcanic dust are large constituents.

FLORA. The eastern plain is covered with trees of great size, beneath which is a thick growth of bushes and vines. There are 54 varieties of trees suitable for hardwood lumber; 40 varieties supplying industrial or medicinal gums, balsams, resins, fibres, oils, extracts, food, drink, and spices; and 74 varieties of fruit trees, of which 17 are wild and 57 cultivated. Rubber abounds, but the supply has been depleted by ruinous methods of collection. For this reason rubber-collecting, except in the Bluefields district, has been prohibited until 1907, though it may be gathered from cultivated trees on rubber plantations which are now being opened. It is believed that the cultivation of rubber will be successful. The resources of the forest are enormous, but as yet are little utilized. Citrus fruits flourish, especially in the western part of the country. The cultivation of most tropical crops is considerably developed and has a great future.

FAUNA. Animal life is very rich and varied, particularly in the moist eastern regions. The principal mammals are the jaguar, cougar, wild swine, deer, monkeys, squirrels, and opos-

sums. Alligators are found in the rivers and along their shores, and turtles, snakes, some very poisonous, and insect life are superabundant.

GEOLOGY AND MINERAL RESOURCES. The Caribbean plain is alluvial. Far inland behind the plain are the highlands of Segovia, Matagalpa, and Chontales, composed of Paleozoic and Mesozoic strata, with granite and basalt intrusions. The gold diggings are found chiefly in these highlands. The broad depression between the mountains extending from near the Gulf of Fonseca to the lakes and the valley of the San Juan is mainly Paleozoic, with a deep covering of volcanic dust and tufa. The country west of the lakes is formed to a great depth of matter ejected from the line of volcanic fissures and cones, which pass through or appear above it. On this erupted mass are situated most of the larger towns, and here is the dwelling place of over seven-tenths of the population. American and British companies do most of the mining. At present only gold mines are worked in Nicaragua, though silver-mining yielded great returns in the sixteenth and seventeenth centuries. The gold mines, about 50 in number, have contributed largely to the wealth of the Republic. Those of Chontales yield from one-fourth of an ounce to two ounces of gold to the ton of ore; those of Nueva Segovia from one and a half ounces to three ounces. The total production in the past ten years has been from 20,000 to 70,000 ounces a year. Tin, nickel, antimony, arsenic, and other metals and minerals have been located, but as yet are not economically important.

AGRICULTURE. The rich farming regions of the west are capable of vastly greater development than has yet been attained. The coffee plantations (many of them belonging to Germans) yield the principal crop, the berry being grown throughout the highlands of the north and northwest. The largest crop was produced in 1902—30,000,000 pounds. Cocoa is of superior quality, but not enough is produced for the home market. The sugar industry is extending. Sugar-cane supplies the coarse brown sugar made at home and is used in the manufacture of aguardiente, a kind of rum. Cotton is indigenous, and of excellent quality, but is grown wholly for home consumption. Three crops of maize a year are raised on the same ground. Large areas, well adapted for tobacco farming, are still untilled. The rubber industry has latterly been waning. Rice is important, and the yam and sweet potato are the principal farinaceous crops. Bread fruit grows to perfection, and is an important article of diet. The banana industry is large and increasing. The coconut and black beans are produced abundantly, and the vegetables of the temperate zone thrive in the more elevated districts. Cattle-raising, particularly in the northwestern provinces, is one of the chief sources of wealth. Large haciendas are devoted to this industry, and many hides are exported.

MANUFACTURES. Manufacturing enterprises are little developed. Coarse cotton fabrics are made, and most of the house furniture is supplied by local factories. Large quantities of cigars are produced and also roofing tiles and other forms of pottery. The Indian industries include the making of hammocks, superior straw hats, jewelry of gold and silver, potteries and carvings. The country depends for its manufactures chiefly upon imports.

COMMERCE. Trade statistics are not published, but the consular reports give an approximate idea of the volume of foreign commerce. The imports in 1901 were approximately \$3,240,000; the exports, \$2,736,000. Of the former, the leading items are cotton, food materials, and their products; of the latter, the leading items are coffee, bananas, gold, cattle, and woods. In 1901, 60 per cent. of the imports came from the United States, and 60 per cent. of the exports went to the United States. Great Britain and then Germany came next in the trade. In 1902 the imports from Nicaragua to the United States were about \$2,000,000; the exports to Nicaragua, \$1,350,000.

TRANSPORTATION. About two-thirds of the foreign trade passes through Corinto. The Government has planned for regular direct steamship connection with New Orleans and Europe. Nineteen small vessels, including one steamship owned by Nicaraguans, are in the merchant trade, and four steamers ply on Lake Managua. There are very few good roads. The railroads are confined to the Pacific coast, and with the completion of the Central Division of the system in November, 1902, there is now a continuous railroad line from Corinto on the Pacific to Granada on Lake Nicaragua, with a branch to Diriamba in the coffee region. The total system in operation is about 200 miles, and practically all belongs to the Government. The latest addition to the service greatly improves the facilities for shipping coffee.

BANKING. The Bank of London and Central America and the Agriculture and Mercantile Bank at Leon have branches in all the important cities, and transact most of the banking business, though many private capitalists also carry on banking.

GOVERNMENT. Nicaragua has a republican form of government. The Constitution (adopted in 1894 and amended in 1896) vests the law-making power in a Congress of one House, with forty members, elected for two years. The session of Congress is ninety days, opening without special convocation at the beginning of August. The President and Vice-President must be at least twenty-five years of age, and citizens of Nicaragua or of one of the Central American republics. They are elected for four years by direct suffrage. The President exercises administrative functions through a council of ministers, composed of the heads of the five departments of the Interior (Justice, Police, and Religion), War and Marine, Foreign Affairs, Finance, and Public Works. The Republic is divided into 13 departments, 2 comarcas, and 3 districts, each of which is under a Governor, who is also commander of the military forces in his department or district. There are a Supreme Court of Justice and two courts of second instance. The military forces comprise the active army, the reserve, and the national guard. The number of active troops varies; in 1900 the number was 2000; in time of war it may be 20,000.

FINANCE. The Government derives most of its revenue from the customs, in addition to which the liquor and tobacco duties yield a considerable amount. The largest items in expenditure are for the Departments of War and Marine, and of Fomento (exploitation). In 1902 the estimated revenues and expenditures each

amounted to about \$2,125,000. The foreign debt, incurred chiefly in the development of the railroad system, was about \$1,312,000 in July, 1902. It is held in Great Britain, and is in arrears. The internal debt at the beginning of 1901 was about \$3,300,000. Metric weights and measures and also the old Spanish denominations are employed. The system of money is the same as in Mexico, silver being the standard value. The silver peso was worth 36.1 cents in United States coin on January 1, 1903.

POPULATION. The census returns are largely estimates, the census of 1900 giving a total of 500,000, which is 80,000 more than the estimate for 1895, and may be exaggerated. Managua is the capital, with 30,000 inhabitants. Other large towns are Leon (45,000), Granada (25,000), Masaya (20,000), and Chinandega (20,000). The number of descendants of Spanish settlers is only about 17,000, the great mass of the population consisting of Indians, negroes, and mixed bloods. The Indians supply most of the labor and are docile and industrious. Most of the country people live in villages, many of them traveling several miles to their fields. The efforts to induce immigration have not been successful.

EDUCATION AND RELIGION. Education is in a very backward condition, and the majority of the people are illiterate. Less than 20,000 pupils attend the elementary schools. The universities at Leon and Granada, with instruction in law and medicine, have been consolidated. There are ten colleges. The only public library is supported by the Government at Managua, and is free to the public. A National Industrial, Commercial, and Scientific Museum has also been established there. The Roman Catholic faith is recognized in the Constitution as the State religion, but other forms of faith are not molested.

HISTORY. The coast of Nicaragua was first seen by Columbus in 1502 or 1503. In 1522 Gil Gonzales Dávila discovered Lake Nicaragua, and in 1526 Pedrarias Dávila led an expedition into the country. It was organized as an intendencia of the Captain-Generalcy of Guatemala in 1528. In 1821 Nicaragua, in common with the other Central American States, revolted from Spain, and was annexed to the Mexican Empire of Iturbide. Upon the downfall of that leader Nicaragua became an independent State, but joined the Confederation of Central America in 1823. That federation dissolved in 1839, and Nicaragua became once more independent. The strife of parties, however, and the play of personal ambition gave the country little peace. In 1841 a dispute arose with Great Britain concerning the rights of a native chief on the Mosquito Coast. This threatened at one time to lead to hostilities, but the matter was finally settled by a clause inserted in the Clayton-Bulwer Treaty of 1850 and by a separate treaty, in which Great Britain ceded all rights of a protectorate over the disputed territory to Nicaragua. The year 1855 was signalized by the famous filibustering expedition of William Walker (q.v.), whose attempt to establish a slaveholding State in Central America for once impelled the different States to common action. Walker was driven out in 1856, and upon his renewing his attempt was captured and shot (1860). There followed for Nicaragua a long period of peace, broken in 1893 by a struggle for the Presidency, which in

turn led to war with Honduras, owing to the unwarrantable interference of that State. Under the energetic administration of President Zelaya Nicaragua proceeded to annex the Mosquito Territory in 1894, and entered thereby into strained relations with Great Britain, which demanded compensation for its subjects. In 1895 Nicaragua, Salvador, and Honduras united to form the Greater Republic of Central America, with provisions for the subsequent admission of Guatemala and Costa Rica. A constitution was adopted and went into effect on November 1, 1898; but one month later, owing to the dissatisfaction of Honduras, the union was dissolved.

Consult also the authorities referred to under NICARAGUA CANAL.

NICARAGUA, LAKE. The largest lake of the American continent between Lake Michigan in the north and Lake Titicaca in the south. It lies in the southwestern part of the Republic of Nicaragua, and is separated from the Pacific coast by an isthmus 11 miles wide at its narrowest point (Map: Central America, E 5). The lake is oval in shape, with a length of 110 miles, a maximum width of 45 miles, and an area of over 3000 square miles. Its depth is from 50 to 120 feet; its greatest depth is about 200 feet. It discharges southeastward into the Caribbean Sea through the San Juan River, and receives the water of Lake Managua through the Tipitapa River. The mean elevation of its surface above the sea is now about 106 feet, but seemingly it was considerably greater 70-100 years ago. Ancient beaches show that in past ages it was continuous with Lake Managua, and discharged into the Pacific Ocean through the Gulf of Fonseca. The shores of the lake are lined with densely wooded mountain ranges, and the lake itself is studded with hundreds of islands, the largest of which, Ometepe, has two active volcanoes. For the proposed interoceanic waterway through Lake Nicaragua, see NICARAGUA CANAL.

NICARAGUA CANAL. A proposed ship canal across the territory of Nicaragua, by way of Lake Nicaragua, connecting the Atlantic and Pacific Oceans. The question of interoceanic communication across Central America first began to occupy the attention of the United States shortly after the establishment of the inde-

pendence of the Spanish American republics. It formed one of the proposed subjects of discussion at the Panama Congress of 1826, Henry Clay, then Secretary of State, instructing the Commissioners from the United States to investigate "the practicability and the probable expense of the undertaking on the routes which offer the greatest facilities." In March, 1835, the Senate instructed the President to open negotiations with the governments of Central America and New Granada with a view to affording protection to any individuals or companies that should undertake to construct a canal connecting the Atlantic and Pacific oceans, and for insuring the free and equal navigation of the canal by all nations. During the administrations of Presidents Jackson and Van Buren commissioners for the purpose were successively appointed, one of whom reported in favor of the Nicaragua route. The interest of the United States in the project was increased by the establishment of a British protectorate over the Mosquito Coast (q.v.) and the acquisition of California and the subsequent discovery of gold there. In 1849 the Government of Nicaragua granted to a company, of which Cornelius Vanderbilt was the chief member, the right to construct a ship canal across the territory of that State. This concession lapsed in 1856 on account of the non-fulfillment of the conditions. In the same year in which the Vanderbilt concession was granted, Mr. Hise, the chargé d'affaires of the United States in Nicaragua, concluded, without authority from his Government, a treaty with Nicaragua, by which the United States received a grant of perpetual and exclusive right of way for the construction of a canal across the Isthmus, and with full jurisdiction over the same, in spite of the British claim to the Mosquito Coast. In return the United States agreed to guarantee the integrity of Nicaragua and forever protect her in the exercise of all her sovereign rights. The treaty did not meet with the approval of President Taylor, and accordingly was not submitted to the Senate, although it was held for a time as a means of influencing the action of Great Britain in the negotiations then in progress for settlement of the controversy in regard to the Mosquito protectorate.

It was now generally believed that the Nicaragua route was the most feasible for the construction of a ship canal, but the claim of Great Britain to the territory around the mouth of the San Juan River, the proposed eastern terminus, was an obstacle to the United States. It was felt to be too serious an undertaking to dislodge her from this position, and it was therefore resolved to negotiate with a view to securing her coöperation in guaranteeing the neutrality of the proposed canal. This was accomplished by the so-called Clayton-Bulwer Treaty (q.v.) of 1850. (For the abrogation of this treaty in 1901, see HAY-PAUNCEFOTE TREATY and PANAMA CANAL.) In the same year Orville Childs, a civil engineer, completed the survey of a route for the proposed ship canal, and made a favorable report on the feasibility of the undertaking. The Vanderbilt Company in the meantime had secured a new concession for the construction of a canal in accordance with the survey made by Colonel Childs; but this was soon revoked by the Government of Nicaragua, chiefly on account

of the Walker filibustering expedition, which had for its object the conquest of Central America. The outbreak of the Civil War arrested further progress toward the construction of the canal, but in 1867 the project was again taken up, and in June a treaty was concluded between the governments of the United States and Nicaragua, by which the citizens of the United States acquired the right of free transit over any canal constructed under the authority of the Government of Nicaragua, but the right of the United States or its citizens to construct the canal was not conceded. During the ten years following 1872 almost every possible route across the Isthmus was carefully surveyed by officers and engineers of the United States Navy. In March, 1872, President Grant appointed, in compliance with a resolution of the Senate, a commission of three eminent military and naval engineers to investigate the subject of an Isthmian canal, and these unanimously reported, February 7, 1876, in favor of the Nicaraguan route, by way of the San Juan River from Greytown and Lake Nicaragua, terminating at Brito on the Pacific coast.

In May, 1879, an international congress was held at Paris to determine the location of the interoceanic canal. The merits of the Nicaraguan route were ably advocated by the delegates from the United States, but the Congress decided in favor of the Panama route. (See PANAMA CANAL.) In 1884 a treaty was concluded between the United States and Nicaragua, by which the United States agreed to build a canal to be owned jointly by the two powers, the United States agreeing furthermore to 'protect' the integrity of Nicaragua. When Cleveland became President, the treaty was still unratified, and he withdrew it from further consideration by the Senate. He declined to resubmit it on the ground that the construction and ownership of the canal under such circumstances would be "inconsistent with its dedication to universal and neutral use" and would "entail measures for its realization beyond the scope of our national policy or present means." In the meantime a scheme had been set on foot, chiefly by leading capitalists of New York, to construct by private enterprise a canal through Nicaragua. In April, 1887, under the name of the Nicaragua Canal Association, they secured from the Government of Nicaragua a concession granting the exclusive privilege of constructing and operating the canal. Surveys were at once begun by a corps of competent engineers, and the final location of the route was soon determined upon. In February, 1889, Congress granted the company a charter of incorporation with a capital of \$100,000,000, with authority to increase the amount to \$200,000,000. In June, 1889, the preliminary work of construction was begun at Greytown, and in the following October the actual work of excavation began. The route finally determined upon was to begin at Greytown on the Atlantic and end at Brito on the Pacific coast, about 170 miles distant. The company erected large storehouses, hospitals, and other buildings at Greytown, established the necessary railroad and telegraph service, and landed large quantities of machinery, tools, lumber, and other materials. Within a period of about one year \$2,000,000 had been expended. In 1893 the company ceased operations owing to lack of funds, a fruitless effort having

been made to induce Congress to guarantee the principal and interest at 4 per cent. of an issue of \$100,000,000 of canal company bonds, to be issued for construction purposes. In 1895 Congress provided for the appointment of three engineers, namely, Colonel Wm. Ludlow, U.S.A.; M. F. Endicott, C.E.; and Alfred Noble, collectively known as the Ludlow Commission, to investigate and report upon the feasibility and cost of completing the work already begun by the company. They reported in favor of the feasibility of the project, estimating the cost at \$133,472,893, as against the company's estimate of about half that amount. In view of the small appropriation made by Congress, and the consequent impossibility of making an exhaustive investigation, the commission advised a more thorough investigation with a view to the possible discovery of a more advantageous route.

Congress then provided for a new commission, popularly known as the Walker Commission, to continue the investigation, with a view of making complete plans for the entire work of constructing the canal. The members selected were Rear-Admiral John G. Walker, U.S.N.; Prof. Lewis M. Haupt, C.E.; and Col. P. C. Hains, U.S.A. With a large corps of engineers, geologists, and other experts, the commission visited Nicaragua in December, 1897, and made a full examination of the topographical, geological, and hydrographic conditions of the country, reporting in May, 1899, that in their judgment the cost of constructing the canal from Greytown to Brito, by way of the Lull route east of the lake and by way of the Childs route west of it, would not exceed \$118,113,790. Colonel Hains, who concurred in the report, estimated the cost at \$134,818,308. In the meantime, interest in the old Panama canal project having been aroused on account of the favorable report of an international commission of experts, it was decided that nothing further should be done toward the construction of a canal by way of the Nicaraguan route until the whole question of canal possibilities had been investigated by a larger commission of experts. Congress accordingly, in March, 1899, provided for a new commission to undertake the task of 'finding the route.' The members appointed by President McKinley were Rear-Admiral Walker, Colonel Hains, and Professor Haupt of the Nicaragua Commission; ex-Senator Pasco of Florida, Alfred Noble C.E., George S. Morrison of New York, Prof. W. H. Burr of Columbia University, Lieut.-Col. O. H. Ernst, U.S.A., and Prof. Emory R. Johnson of Pennsylvania. After an exhaustive investigation of all the proposed routes on the entire Isthmus from Nicaragua to Colombia, the commission reported, November, 1901, unanimously in favor of the Nicaraguan route as "the most practicable and feasible," chiefly on account of the financial difficulties in the way of acquiring the property and franchises of the Panama Canal Company. The Panama Company now removed this difficulty by offering to sell its property and franchises to the United States for \$40,000,000, the valuation which the Canal Commission had placed upon the work already done on the Panama route. The commission thereupon in a supplementary report recommended the acceptance of the offer. Already in May, 1900, the House of Representatives had by a vote of 225 to 35 passed a bill for the construction of a canal by way of the Nicara-

guan route, which, however, the Senate had refused to accept. In January, 1902, the House repassed this bill by a vote of 307 to 2. Shortly thereafter came the supplementary report of the Canal Commission recommending the purchase of the Panama Company's property and franchises. This led the Senate to hold up the House bill for further consideration of the Panama scheme. Finally it refused to accept the Nicaragua plan, and after three months of debate the two Houses, largely influenced by the volcanic occurrences in the Caribbean region, agreed upon the Panama route, with the understanding that the Nicaraguan route should be reverted to in case a satisfactory title could not be secured to the Panama property and the necessary territory from the Government of Colombia. In such case the President was authorized to begin negotiations with the Government of Nicaragua for the necessary concessions, and to construct the canal at a cost not exceeding \$180,000,000.

O. Selfridge (ib., 1874). See Map of CENTRAL AMERICA; see also PANAMA CANAL.

NICARIA, nê-kâ-rê'a or **ICARIA**. A Turkish island, situated off the western coast of Asiatic Turkey, a short distance west of Samos (Map: Balkan Peninsula, F 6). Area, about 53 square miles. It is mostly mountainous, rising over 3000 feet above the sea. Wood is one of the chief products. The inhabitants, who number about 8000, are chiefly engaged in the production of charcoal and in sponge fishing.

NICASTRO, nê-kâ'strô. A city in the Province of Catanzaro, Italy, beautifully situated near the sea, 16 miles west-northwest of Catanzaro (Map: Italy, L 9). It is the see of a bishop. It has the ruins of a mediæval castle. The town has a trade in wine and oil. There are hot springs in the vicinity. Population (commune), 1901, 17,524.

NICCOLINI, nîk'kô-lê'nê, GIOVANNI BATTISTA (1782-1861). An Italian poet, born at San Giuliano, near Pisa, October, 1782. He studied at Florence and took his degree in law at the University of Pisa. In 1802 he took a Government clerkship; from 1804 to 1807 he was in the office of the Archivio delle Riformagioni, and from 1807 until his death he was professor of history and mythology, secretary and librarian in the Accademia di Belle Arti at Florence, and for a while also librarian of the Palatine Library. His critical and historical treatises, many of them produced in connection with his academic labors, constitute the less important part of his work. As a poet he attained to greatest excellence in tragedy, but he also revealed no little force in his lyrics (*Poesie nazionali*, 1859; *Pensieri poetici*, 1860; *Canzoniere nazionale e poesie varie*, 1863; *Canzoniere civile*, 1884; *Versi inediti*, 1888), and in his translations from Æschylus, Euripides, and Ovid. In his original dramas of the earlier period he adhered to the classic Greek model, wherein we find the norm of his *Polissena*, *Ino e Temisto*, *Edipo*, and *Medea*. The *Nabucco*

(1816; published at London 1819) was his first political drama, and it assailed absolute power of all kinds. Another manifesto against absolute power is the *Antonio Foscarini* (performed in 1827), the most popular of his tragedies. The plays of his second period show his tendencies to romanticism. His *Beatrice Cenci* is based on that of Shelley. The *Giovanni da Procida* (1817; performed in 1830) was a protest against the anti-Italian sentiments of the French dramatist Casimir Delavigne, and, like the *Lodovico Sforza* (1834), advocated the unity and independence of Italy. There is no political intention discernible in the *Rosmunda d'Inghilterra* (performed in 1838), but his masterpiece, the *Arnaldo da Brescia* (1843), again proclaims the sovereignty of the people over imperial and ecclesiastical power, and attacks especially the temporal power of the Pope. The fundamental ideas of the *Arnaldo* reappear in *Filippo Strozzi* (1847). His plays, with all their merits, are rather lyric than genuinely dramatic in spirit. Consult the edition of his *Opere* prepared by himself and first published at Florence, 1844; also the *Opere edite e inedite*, an ed. by Gargioli (Milan, 10 vols., 1863-1880); Vannucci, *Ricordi della vita e delle opere di Giovanni Battista Niccolini* (Florence, 1866).

NICCOLÒ DE' NICCOLI, nèk'kò-lò' dà nèk'-kò-lé (or, more often, **NICCOLI NICCOLÒ**) (1363-1437). An Italian scholar, born in Florence. He was a collector of coins, and particularly of Greek and Latin manuscripts. These he procured from every possible source, and often copied them with his own hand. In his fine house in Florence he entertained the élite of the literary and artistic society of the day, as well as humble students, and was looked upon as the supreme authority in all matters of letters. Even the most famous scholars feared his caustic tongue. After his death, Cosmo de' Medici bought his manuscripts, and made them the foundation of the present Laurentian Library of Florence.

NICCOLÒ D'AREZZO, à-rèt'sò (also called **NICCOLÒ LAMBERTI**, and **NICCOLÒ DI PIERO**) (1350-1417). An Italian sculptor and architect, born at Arezzo. His master was probably Moccio of Siena. He was first employed in Florence on minor works in the cathedral. After the plague (1383) he returned to Florence and executed two statues, believed to be those of Saint Gregory and Saint Augustine, for the Campanile. He also did some decorative carving on the northern door of the Duomo, and at Or San Michele. These, like his other carvings, show a marked gain in freedom and elegance over the work of former sculptors. He executed a relief of the Virgin on the façade of the Santa Maria della Misericordia, Arezzo, and the mausoleum of Pope Alexander V. in the Certosa, Bologna; and was employed as architect on the Castle of Sant' Angelo, Rome, and to restore the walls of Borgo San Sepolcro.

NICE, nès. A city in Bithynia. See **NICÆA**.

NICE. The capital of the Department of Alpes-Maritimes, France, situated on the Mediterranean, at the foot of the Alps, and at the western extremity of the Riviera, 140 miles by rail east-northeast of Marseilles, and 640 miles from Paris (Map: France, O'8). Nice is far-famed as a place of sojourn for health-seekers, some 15,000 of whom visit it yearly. The city and its bay are protected by the mountains on the north.

The climate is dry, mild, and invigorating. It is warm in winter and not hot in summer. Mean annual temperature 58.6° F.—January 45.4°, July 73.8°. Frost and snow are rare. The rainy period is in the fall. The fashionable season begins soon after January 1st and lasts till June 1st. The situation of Nice, where the small Paglione empties into the sea, is splendid. There is a circle of forts in the rear, and the city is important strategically to France. On the left bank of the covered-over stream is the little old town, with narrow, crooked streets. In this section a mixture of Provençal and Italian is spoken. Along the sea front here extends a fine boulevard. At its east end rises Castle Hill, on which runs a promenade, whence an immense and admirable view of the coast may be had. Beyond the hill lies the city's small harbor, called *Limpia*.

On the western bank of the Paglione is the more important foreigners' quarter, where French is the universal language. In this section the avenues are spacious and beautiful, with plane trees and eucalypti, and the city presents the delightful appearance of a southern sea resort. The centre of life in this part is the Square *Mas-séna*, on which stands the bronze statue to *Mas-séna*, who was born in Nice. Adjacent is the Casino, an attractive modern municipal structure, containing gaming rooms, a theatre, and an entertainment garden. From the Casino the Public Garden, exceptionally attractive with its palm, pepper, myrtle, and laurel trees, reaches to the sea, and terminates in the splendid iron and glass pier promenade. From this point west along the bay for a distance of over two miles is the wide, magnificent Promenade des Anglais, flanked by villas and spacious hotels, and having gardens of orange and lemon trees and acres of flowers. Among the objects of interest in the city are a marble cross, commemorating the meeting here of Francis I. and Charles V. in 1538; the modern centenary obelisk in honor of the union of Nice with France in 1792; a pyramid to the memory of Garibaldi, a native of Nice; also a statue of him, and a bust of President Carnot.

The public library has nearly 100,000 volumes. The Museum of Natural History is noteworthy for its collection of mushrooms. The municipal museum contains mediocre works of modern French artists. Nice has a nunnery, a lyceum, a priests' and a teachers' seminary, a charity hospital, and an important astronomical observatory (on Mont Gros), with one of the largest refractors in the world. The municipal theatre has good opera in the season. The carnival—an elaborate fête of flowers, confetti, and Moccoletti—is an annual occurrence which attracts pleasure-seekers from all countries. To the north of Nice lies Cimiez, with its interesting Roman remains. Nice exports oranges, lemons, flowers (for which it is celebrated), perfumes, olives, oils, and liquors. It also manufactures ivory goods, furniture, silk, dyes, etc. Some marble is quarried near. The city shows a marked increase in commercial importance and in population. Its inhabitants numbered 105,109 in 1901.

Nice was the *Nicæa* of the ancients, and dates from the fourth century B.C., when it was settled by Phœceans from Marseilles. It suffered in many wars and at the hands of many races. It belonged in the late Middle Ages to Provence, and

finally passed to Savoy. The French took it in 1792; it was given back to Sardinia after the fall of Napoleon, and became again a part of France in 1860. It suffered severely from an earthquake in 1877. Consult: Hole, *Nice and Her Neighbors* (London, 1881); Lee, *Nice and Its Climate* (ib., 1854); Moris, *Nice* (Paris, 1899).

NICE, COUNCILS OF. See **NICÆA, COUNCILS OF.**

NICENE CREED, THE. Frequently called the **NICENO-CONSTANTINOPOLITAN CREED.** The most important ancient formula of the Christian faith, and the only one which approaches ecumenical authority. Since the fifth century it has commonly been believed that this creed was adopted at the Council of Nicæa (325), and reaffirmed at Constantinople (381); but this view is certainly wrong. The creed in question is practically identical with one given by Epiphanius, in his *Anacrotus* (374), which in turn draws its material from Cyril of Jerusalem (*Catechetical Lectures*, 347), and from the symbol actually adopted at Nicæa. This original Nicene formula was drawn up to combat Arianism (q.v.), and was based upon a creed which had long been used in Cæsarea. Its leading characteristic was that, in defining the orthodox doctrine of the Trinity, it asserts the consubstantiality of the Son with the Father, i.e. that both are of the same essence or substance. (See **HOMOUSION.**) Our so-called Nicene Creed is longer and more symmetrical in construction than the one actually adopted at Nicæa. In the article on the Holy Spirit, the Eastern Church has always used the form which reads "And [I believe] in the Holy Ghost, . . . who proceedeth from the Father," whereas the Western Church says, "Who proceedeth from the Father and the Son." This difference has proved a prolific source of controversy. (See **FILIOQUE.**) The Nicene Creed finds a place in the liturgies of the Greek, Roman, and Anglican churches, and its doctrinal teaching has been accepted by most Protestants.

(Edinburgh, 1871); Bindley, *Ecumenical Documents of the Faith* (London, 1899).

NICEPHORUS (Lat., from Gk. *Νικηφόρος*, *Nikēphoros*) (c.758-c.828). Patriarch of Constantinople. He was born in Constantinople, the son of Theodore, Imperial secretary of Constantius Copronymus. He first held high office at court. In 787 he was present as Imperial commissioner at the Nicene Council, where, in defense of image-worship, he opposed the iconoclasts. This zeal for image-worship he inherited from his father. Soon after his return to the capital he retired to a convent, whence in 806 he was called to be Patriarch of Constantinople. Leo the Armenian, who became Emperor in 813, passed an edict in 814 against the worship of images. But neither menaces nor entreaties could induce Nicephorus to assent to it. He became unpopular at court, and in the ensuing year was deposed, and withdrew to the convent of Saint Theodore, which he himself had founded,

and remained there till his death in 828 (or 828). He published several valuable ecclesiastical works, characterized by great beauty of style, and historical productions distinguished for accuracy, discernment, and erudition. The most important are *Breviarium Historicum*, an historical abridgment, and *Chronographia Brevia*, a short chronicle of events from the beginning of the world to the author's time, with the series of kings, emperors, patriarchs, bishops, etc. The best edition of both treatises is by De Boor, *Nicephori Constantinopolitani Opuscula Historica* (Leipzig, 1880). Nicephorus is numbered among the saints in both the Greek and the Roman Catholic churches.

NICEPHORUS I. (died 811). Byzantine Emperor from 802 to 811. He overthrew the Empress Irene, whose minister of finance he had been. He was cruel and tyrannical, and the heavy taxes he imposed made him unpopular. He waged war against Harun al-Rashid, but was unsuccessful, and had to conclude a disgraceful peace in 806. He also tried to check the Bulgarians, and though successful at first, was finally defeated and slain at Marcellae on July 25th, 811. Consult Gibbon, *Decline and Fall of the Roman Empire*, ed. by Bury (London, 1896-1900).

NICEPHORUS II. PHOCAS (c.913-969). Byzantine Emperor from 963 to 969. He was the descendant of an illustrious race, and distinguished himself during the reigns of Constantine VII. and Romanus II. In 961 he recaptured Crete from the Saracens, and after the death of Romanus was proclaimed Emperor and married Theophano, the widow of his predecessor. As Emperor, Nicephorus waged successful war against the Mohammedans, and in 969 captured Antioch, and brought home as a trophy the sword of Mohammed. He was also successful against the Bulgarians. The numerous wars, however, necessitated increased taxes, and Nicephorus speedily became unpopular. He was finally murdered by his wife's lover, John Zimisces, who ascended the throne. It was during this reign that Liudprand (q.v.) came to Constantinople on an embassy from Otto I. Consult: Schlumberger, *Un empereur byzantin au dixième siècle. Nicéphore Phocas* (Paris, 1870); Gibbon, *Decline and Fall of the Roman Empire*, ed. by Bury (London, 1896-1900).

NICEPHORUS III. BOTANIATES (died 1081). Byzantine Emperor from 1078 to 1081. He belonged to the same family as Nicephorus II., and had distinguished himself as general under Constantine X. (XI.), Ducas and Romanus IV. When during the reign of the weak Michael VII. Nicephorus Bryennius was proclaimed Emperor by the European legions, Nicephorus Botaniates immediately had himself nominated as Emperor by the Asiatic troops. The latter was successful, through the aid of the Sultan Solyman, and was crowned on April 3, 1078. His reign was fairly successful, but he quarreled with his general, Alexius, and in consequence he had to abdicate and retire to a monastery in April, 1081, where he died a few months later. Consult Gibbon, *Decline and Fall of the Roman Empire*, ed. by Bury (London, 1896-1900).

NICETAS CHONIATES, *kō'nī-ā'tēs* (Lat., from Gk. *Νικητας Χωνιάτης*, *Nikētas Chōniatēs*), or **ACOMINATUS** (c.1145-1215). A Byzantine

historian, born at Chonæ, the ancient Colossæ. He held high office under the Byzantine emperors during the last years of the twelfth century. Nicetas was in Constantinople when the city was captured by the Latins (1204) and escaped to Nicaea. His history of the Greek emperors from 1118 to 1206 completes Zonaras, and is an excellent authority. It is best edited by Bekker (Bonn, 1835). A valuable description of the statues in Constantinople destroyed by the Latins may have been originally composed by Nicetas; in its present state it seems to have suffered additions by a later author. It was edited by Wilken (Leipzig, 1830).

NICHE, nich (Fr. *niche*, from It. *nicchia*, niche in a wall like the hollow of a shell, from *nicchio*, shell, niche, from Lat. *mitulus*, *mytilus*, *mytilus*, mussel, from Gk. *μύτιλος*, *mytilos*, *μύτιλος*, *mytilos*, mussel, from *μῦς*, *mys*, mouse). A recess formed in a wall, commonly for the purpose of containing a statue or some ornamental figure or piece of furniture. In classical architecture, the niches are generally square recesses with canopies formed by small pediments. In Gothic architecture, the niche is one of the most frequent and characteristic features, the doorways, buttresses, and every part of the buildings being in many instances ornamented with niches and statues in endless variety, the openings being arched and decorated with colonnettes, gables, pinnacles, and intricate detailed ornament. In the Mohammedan mosque the direction of Mecca (called Kiblah), the sacred city, is marked by a niche called *Mihrab*. In early and mediæval churches niches were frequently built to receive pieces of ecclesiastical furniture.

NICHIREN, nich'i-rën (1222-82). A Japanese religious teacher, and the founder of an influential sect of Buddhists, the Hokkes. He was born in Kominato, the Province of Awa. He was devoted to the priesthood from his birth, for his mother had dreamed that the sun had entered her body. He completed the prescribed studies at an early age, was admitted to the priesthood and became a violent and bitter sectarian. So severe were his attacks upon all other forms of Buddhism that he was banished for a time, and later was condemned to death on the charge of teaching doctrines subversive of the Government. His life was saved by a miracle, but he was again banished. Possessed, as it is said, of miraculous powers, he gained large numbers of followers, and founded the sect which is popularly known by his name. He added nothing to the doctrinal development of Buddhism, being dependent upon Chinese sources for his ideas. But he brought to Buddhism a spirit of intolerance and bitter persecution far other than the spirit of its founder. The sacred book of the sect is the Sanskrit *Saddharma Pundarika*, which has been translated into English by Kern in Müller, *Sacred Books of the East*, vol. xxi. (Oxford, 1884).

NICHOL, nik'ol, JOHN (1833-94). An English scholar, son of John Pringle Nichol, the astronomer. He was born in Montrose, Scotland, and educated at the University of Glasgow (1848-55), and at Balliol College, Oxford (1855-59). In 1865 he visited the United States, where he became acquainted personally with Emerson and Longfellow. He was made LL.D. by Saint Andrews (1873); professor of English literature at Glasgow

(1861-89); he lectured in Scotland and England; advocated broad Church doctrines, and took the side of the North in the American Civil War. He died October 11, 1894. Nichol contributed to the *Westminster, North British*, and other reviews; was one of the writers on the *Encyclopædia Britannica*; and published *Fragments of Criticism*, a volume of essays (1860); *Hannibal*, a classical drama (1872); *Byron*, in the "English Men of Letters Series" (1880); *American Literature: An Historical Review* (1882); *Landmarks of English Literature* (1882); *Lord Bacon's Life and Philosophy* (1887-89); and several educational treatises. Consult the *Memoir* by Knight (Glasgow, 1896).

NICHOL, JOHN PRINGLE (1804-59). A Scottish astronomer, born at Huntly Hill, near Brechin, in Forfarshire. He received his education at King's College, Aberdeen, where he highly distinguished himself in mathematics and physics. He engaged in preaching before he was of age, but his fondness for scientific studies led him to give up the ministry. He was for some time editor of the *Fife Herald*, and later headmaster of Cupar Academy, which position he resigned to become rector of Montrose Academy (1827). Having declined the chair of political economy in the Collège de France, Paris, he was appointed, in 1836, regius professor of astronomy in the University of Glasgow. In this capacity he effected the equipment and transference of the Glasgow Observatory to its present site on Dowanhill. His astronomical work was directed chiefly to the physical features of the moon, and to the nebular theory. In one of his works he made the earliest suggestions for the study of sun-spots by photography. He visited the United States in 1848 and lectured publicly on scientific subjects. He was a fellow of the Royal Astronomical Society and a member of the Royal Society. Among his works may be mentioned: *Views of the Architecture of the Heavens* (1838 and nine subsequent editions); *Contemplations on the Solar System* (1844); *Exposition and History of the Planet Neptune* (1848); *The Stellar Universe* (1848); *The Planetary System, Its Order and Physical Structure* (1851); *A Cyclopædia of the Physical Sciences* (1857). Consult Maclehose's *Hundred Glasgow Men*, and Stewart's *University of Glasgow, Old and New*.

NICHOLAS, nik'ô-las. The name of five popes. NICHOLAS I., Saint, Pope 858-67. He was of a noble Roman family, and was employed in important affairs by Benedict III., whom he succeeded, being crowned—the first recorded instance of the coronation of a pope—in the presence of the Emperor Louis II. The most important events of his pontificate are those connected with his conflict with Photius, who had been illegally intruded into the See of Constantinople. (See PHOTIUS; GREEK CHURCH.) Throughout his reign he was one of the most uncompromising upholders of the claims of the Roman See to universal jurisdiction. A prolonged contest in practical matters with a Western prelate of great power and individuality, Hincmar, Archbishop of Rheims, was terminated by Hincmar's submission. The matrimonial affairs of the German princes also gave him much trouble; and his firmness in upholding the sanctity of the marriage tie brought him into conflict with the Emperor, who marched upon Rome and held the Pope a prisoner without food

for two days in the Castle of Sant' Angelo, until, terrified by a sudden illness and by some fatalities which befell his followers, he drew off his forces and made peace. Nicholas brought the new Slavonic Church, just growing up through the preaching of Cyril and Methodius (q.v.), under the control of the Papacy. Altogether he was one of the most vigorous of the early popes, one who laid the foundations upon which Gregory VII. could build; an impressive figure, who may stand with Charlemagne to close the centuries of formation and preparation, and open the Middle Ages. Consult: Leroy, *Saint Nicholas I.* (Paris, 1898; Eng. trans., London, 1901); Hergenröther, *Photius, Patriarch von Constantinopel* (Regensburg, 1867); Lämmer, *Papst Nikolaus I. und die byzantinische Staatskirche seiner Zeit* (Berlin, 1857); Schrörs, *Hincmar, Erzbischof von Reims* (Freiburg, 1884).

NICHOLAS II., Pope 1059-61, Gerhard by name, a Burgundian by birth. He was a canon of Liège, and in 1046 became Bishop of Florence. When, on the death of Stephen X. in 1058, the so-called Tusculan faction of the Roman nobility chose the Bishop of Velletri Pope under the name of Benedict X., Hildebrand induced an assembly at Siena in December to elect Gerhard. The Empress Agnes espoused his cause, and he entered Rome in January. Hildebrand became archdeacon of the Roman Church in the latter part of the same year (1059), and was the soul of the entire Pontificate of Nicholas. (See GREGORY VII.) Under his influence and that of Peter Damiani stringent measures were enforced against simony and concubinage; the Papal election was also definitely restricted to the college of cardinals, and the whole tendency of Nicholas's administration was to free the Church from the invasion of external influences. He died in Florence, July 19, 1061, and was buried in his former cathedral.

NICHOLAS III., Pope 1277-80, Giovanni Gaetano degli Orsini. He was made cardinal by Innocent IV. in 1244, and employed by several popes in important diplomatic missions. On the death of John XXI., he was elected at Viterbo after a prolonged division in the conclave, which was only terminated by the citizens locking the cardinals up in the town hall. He had already acted as mediator between Charles of Anjou and Rudolf of Hapsburg, and now employed his influence with them to strengthen materially the temporal power of the Church in Italy. He is described as a man of strict morals and considerable learning, though the reproach of nepotism is brought against him.

NICHOLAS IV., Pope 1288-92, Geronimo by name. He entered the Franciscan Order at an early age, and in 1272 was sent to Constantinople to invite the Greeks to the Council of Lyons. Two years later, on the death of Saint Bonaventura, he was elected general of his Order. Nicholas III. made him a cardinal, and Martin IV. Bishop of Palestrina. After nearly a year's interregnum he was chosen to succeed Honorius IV., and was the first Franciscan Pope. In his time Acre, the last stronghold of the Christians in the East, fell into the hands of the Moslems; and he made vigorous attempts to stir up Christendom to renewed efforts against them, also making strenuous endeavors to convert the Tatars.

NICHOLAS V., Pope 1447-55, Tommaso Paren-

tucelli. Born probably at Sarzana, near Pisa, in 1397, he was educated at Bologna and Florence. In 1426 he came to Rome and was employed in the ecclesiastical service. In 1444 he was made Bishop of Bologna and cardinal two years afterwards in recognition of his skill in conducting difficult negotiations in Germany. On succeeding three months later to the Papal throne, he addressed himself first to the settlement of the troubles growing out of the Council of Basel, and prevailed upon the Antipope Felix V. to resign his claims, thus securing universal recognition in 1449 and restoring peace to the Church. In 1452 he crowned Frederick III. as Emperor—the last Imperial coronation to take place in Rome. He sought to stir up Christendom to oppose the advance of the Turks. He reproached the Greeks with their dilatory postponement of the agreements made at the Council of Florence, and upon the Greek Emperor finally accepting his conditions, sent Cardinal Isidore to Constantinople with troops and money. The submission of the Greeks was, however, only feigned; and on May 29, 1453, Constantinople fell into the hands of the Mohammedans. In the revival of classical learning which preceded and followed that event Nicholas was actively concerned. He dispatched agents in all directions, east and west, to purchase or to copy every important Greek and Latin manuscript. The number collected by him was about 5000. He remodeled and may almost be said to have founded the Vatican library. He caused translations to be made of the Greek classics, both sacred and profane. He invited to Rome the most eminent scholars of the world, and extended his special patronage to the Greeks who were driven from Constantinople; in short, he did all in his power to make Rome the centre of the world, both in art and letters.—The name of NICHOLAS V. was also assumed by the Antipope set up by Louis of Bavaria against Pope John XXII. in 1328, the Franciscan Pietro Rainalducci di Corbara, who finally made his submission and died at Rome in 1333.

NICHOLAS I. (1844—), Prince of Montenegro. He was educated in Cetinje, Trieste, and Paris, returning to Cetinje when about twenty years old. His uncle, Prince Danilo, was assassinated in August, 1860, and Nicholas was immediately proclaimed Prince. In the same year he married Milona, daughter of Peter Valsesitch, president of the Council of State. Danilo Alexander, his eldest son, was born June 29, 1871. Helena, one of his six daughters, became the wife of the Prince of Naples, now Victor Emmanuel III. of Italy. He has introduced many reforms in education, the civil administrations, and the army. The period of Nicholas's reign has been one of much moment for Montenegro, which obtained from the European Powers recognition of its independence in the treaty of Berlin (1878). He has shown himself on the whole a capable ruler, using for the good of his people the almost absolute power he holds. See MONTENEGRO.

NICHOLAS I., PAVLOVITCH (1796-1855). Emperor of Russia from 1825 to 1855. He was the third son of Paul I., and was born at Saint Petersburg July 6 (old style June 25), 1796. His early education was under the direction of his mother, a princess of Württemberg. His later studies were principally in the fields of economics and military science, but he evinced no especial abil-

ity in these branches. He traveled in England and on the Continent in 1816, and also made a tour through the Russian provinces. On July 13, 1817, he married Charlotte, the eldest daughter of Frederick William III. of Prussia. The death of Alexander I., in December, 1825, and the previous renunciation by his elder brother, the Grand Duke Constantine (q.v.), of his claims to the throne (1822), made Nicholas Emperor, but he was obliged to meet at the outset a military conspiracy, which was stamped out with ruthless severity—the celebrated rising of the Decembrists. (See RUSSIA.) Capital punishment, abolished by the Empress Elizabeth, was revived, for the purpose of inflicting it upon the leaders of the insurrection. Nicholas, like other czars, showed at the beginning of his reign some zeal for reform; but the spirit died out, giving place to the old despotism, and he became the embodiment of the reactionary spirit of the Holy Alliance. Nevertheless, his first great measure, the codification of Russian law, commenced in 1827, was continued and completed in 1846. A war with Persia began soon after his accession, and was concluded on February 28, 1828, by the peace of Turkmanchai, which gave Persian Armenia to Russia. Close upon this followed a successful but costly war with Turkey, concluded by the Peace of Adrianople (q.v.) which obtained for Russia another increase of territory, the free navigation of the Danube, the right of free passage between the Black and Mediterranean seas, and the protectorate over Moldavia and Wallachia. The revolutionary agitation of 1830 communicated itself to Russian Poland, where there was a national rising, suppressed after a contest of nine months, which taxed the military resources of the Empire. Nicholas converted the Kingdom of Poland into a Russian province, and began the process of Russification, which has since been in progress. Russia, which had been approaching more closely the standards of Western Europe, gradually lost its newer aspect. The press was placed under a strict censorship, and education was directed, not to the development of the people, but to preparation for the work of the State. The process, begun in Poland, was to be carried out all over the Empire, until all the foreign elements were completely Russianized and unified in people and religion. The independence of the mountaineers of the Caucasus was inconsistent with the Emperor's schemes, and war was waged against them with the greatest energy and perseverance, but at the cost of immense sacrifices both of money and lives. Nicholas sought to check the advance of British influence in Central Asia, and to counteract it tried various means, among which was the expedition for the conquest of Khiva in 1839, which ended in disaster. Between 1844 and 1846 he visited England, Austria, and Italy. When the Revolution of 1848 broke upon Europe, Nicholas refrained from interference until, by aiding in the suppression of the Hungarian national uprising against Austria, he was able to win Austria's gratitude and strike a blow at the Magyars, who interfered with Pan Slavism. Nicholas was intent on carrying into effect the hereditary Russian designs upon Constantinople, and in 1853 provoked a war with the Sultan; but the opposition of Great Britain and France plunged Nicholas into a much more terrible struggle than he had anticipated. (See CRIMEAN WAR.) In the course of the war

he died at Saint Petersburg, March 2, 1855, his death having undoubtedly been hastened by chagrin at the repeated defeats which his arms sustained, and the excessive labor he underwent to repair his losses. He was remarkable for temperance, frugality, and patriotism, but equally so for vanity and ostentation. Consult: Smucker, *Nicholas I.* (Philadelphia, 1860); Balleydier, *Histoire de l'empereur Nicolas* (Paris, 1857); Lacroix, *Histoire de Nicolas I.* (ib., 1864-73); Edwards, *The Romanoffs* (London, 1890).

NICHOLAS II. (1868—). Emperor of Russia from 1894. He was born at Saint Petersburg, May 18 (old style May 6), 1868, the eldest son of Emperor Alexander III. and Maria Feodorovna (Princess Dagmar, daughter of Christian IX. of Denmark). In 1890-91 he traveled extensively in the East, and while in Japan narrowly escaped assassination at the hands of a maniac. He traversed the length and breadth of the Russian Empire and went through Siberia by the old conveyances along the route of the Siberian railway, thus obtaining an adequate appreciation of the importance to Russia of that gigantic undertaking. On the death of his father, Alexander III. (November 1, 1894), he succeeded to the throne. Although regarded prior to his accession as a mild and somewhat indefinite character, his administrative acts exhibited energy and decision. He brought into his service some of the ablest statesmen of Russia. The Empire in the reign of Alexander III. was influenced politically by the reaction from liberal agitation caused by the assassination of the Liberator Czar; the conservative national Russian party had become dominant, and this was not changed through the accession of Nicholas. The process of Russification went on uninterruptedly in Poland and the Baltic Provinces, and even extended to Finland (q.v.), which by all previous czars had been allowed to retain its national existence. The great object of the internal policy of the Government has been to consolidate Russian nationality and to develop the strength and resources of the Empire. Nicholas and his advisers were apparently inclined to believe that in the present state of civilization among the Russian people this can best be done under the autocracy. Under him Russia steadily advanced its interests in the far East, won by its diplomacy open harbors on the Pacific, developed a great railway system on strategic lines through the whole Empire, and accomplished much in the upbuilding of its own industries. Perhaps the most notable act of the Czar was the peace rescript of 1898, looking to a reduction of national armaments, the result of which was the peace conference at The Hague. (See HAGUE PEACE CONFERENCE.) Nicholas married, November 26 (14), 1894, Princess Alexandra Alix, daughter of the Grand Duke of Hesse. Consult: Leudet, *Nicolas II. intime* (Paris, 1899); Prince Ukhtomski, *Voyage en Orient, Grèce, Egypte, Inde, 1890-91, de son altesse impériale le Césarevitch* (French translation by Léger, with preface by A. Leroy-Beaulieu (ib., 1893).

NICHOLAS, Sir EDWARD (1593-1669). A minister of Charles I. of England. He was born at Winterbourne Earls, Wiltshire. He was a member of Parliament in 1620-21, 1623-24, and 1627-28, and in 1641 was made Secretary of State and Privy Councilor. When the Royalist cause was lost, Nicholas went to live in Normandy, but was

nominally the secretary of Charles I. until his execution, and tried to serve Charles II. as faithfully, but the jealousy of Queen Henrietta Maria prevented him from holding the position, except in name. He returned to England at the Restoration, but retired in 1662.

NICHOLAS, GEORGE (c.1755-99). An American soldier and politician. He was born in Hanover, Va., and graduated at William and Mary College in 1772. He took the patriot side in the Revolution, became captain of the Second Virginia Regiment in October in 1775, major of the Eleventh Virginia Regiment in November in 1776, lieutenant-colonel of the same regiment in September, 1777, and resigned from the service in the following November. In 1781, as a member of the Virginia Assembly, he introduced articles of impeachment, founded on charges of incompetency, against Governor Jefferson, but they were not adopted. In 1788 he did much in the Virginia Convention to secure the ratification of the Federal Constitution. He removed to Kentucky in 1790, took the leading part in framing the State Constitution of 1792, and became the first Attorney-General of the State.

NICHOLAS, SAINT (?-326). A highly popular saint of the Roman Catholic Church, revered with still greater devotion by the Russian Church. Of his personal history hardly anything is known with certainty. He is said to have been Bishop of Myra in Lycia and to have taken part in the Council of Niceæ. With more probability, however, he is referred to a later date, but he certainly lived prior to the reign of Justinian, in whose time several of the churches of Constantinople were dedicated to Saint Nicholas. The great popularity of Saint Nicholas rests mainly on the traditions, both in the West and in the East, of the many miracles wrought through his intercession. He is regarded in Catholic countries as the special patron of the young, and particularly of scholars; also parish clerks, travelers, sailors, and pawnbrokers. As his protection was implored against robbers, these persons came to be called 'Clerks of Saint Nicholas.' In England his feast was celebrated in ancient times with great solemnity in the public schools and elsewhere; the supposed day of his death, December 6, is still observed with curious popular ceremonies in Germany. The nearness of his feast to that of Christmas Day led to the confounding of the two, so that we are told that Santa Klaus, a Dutch corruption of the name Saint Nicholas, gives the presents of Christmas. In art Saint Nicholas is represented as clad in episcopal robes and carrying three purses, three different stories, illustrating the saint's charity. The supposed relics of Saint Nicholas were conveyed from the East to Bari, in the Kingdom of Naples, May 9, 1087, and in the Russian Church the anniversary of this translation is still observed as a festival.

NICHOLAS, WILSON CARY (c.1757-1820). An American legislator, the son of Judge Robert Carter Nicholas. He was born at Hanover, Va., graduated at William and Mary College in 1774, and at the outbreak of the Revolutionary War enlisted in the Continental Army, serving for the greater part of the war as an officer of Washington's 'Life Guards.' In 1788 he was a member of the Virginia convention that ratified the Federal Constitution, and was himself a supporter of that

instrument. In 1799 he became a Republican member of the United States Senate, but resigned in December, 1804, to become collector of customs for Norfolk and Portsmouth. From 1807 to 1811 he was a member of Congress, and from 1814 to 1817 was Governor of Virginia.

NICHOLAS NICKLEBY, nîk'1-bl. A novel by Charles Dickens. It appeared as a serial in 1838 and 1839. The hero began his career as a teacher in Squeers's school, Dotheboys Hall, Yorkshire, of which Dickens gives a terrible picture, showing the evils of cheap schools of that time. After a struggle as secretary, actor, and clerk, Nicholas became a member of the firm of Cheeryble Brothers. The leading characters are Ralph Nickleby, his son, the miserable Smike, the Squeerses, and the Mantalins.

NICHOLAS OF CLÉMANGES, klâ'mânzh'. See CLÉMANGES.

NICHOLAS OF CUSA. See CUSA.

NICHOLAS OF LYRA (c.1270-1340). An eminent biblical scholar. He was born at Lyra (Lyre) in Normandy; entered the Franciscan College at Verneuil in 1291, and afterwards studied in Paris; became a doctor of theology, and a successful teacher; held some of the most important posts of his Order, among which was that of Provincial for Burgundy, and was eminent as a lecturer on biblical interpretation. His works were approved by the Reformers and used by them to support their arguments. In his system of interpretation he gave preference to the literal, as being the one on which all the other methods—mystical, allegorical, and spiritual—were based. His chief work, *Postillæ Perpetuæ in Universa Biblia*, has been regarded as marking the beginning of a school of natural exegesis. He also wrote on the coming of the Messiah, in reply to Jewish critics (*Tractatus Fratris Nicholai de Messia Ejusque Adventu Una cum Responsione ad Judæorum Argumenta Quatuordecim contra Veritatem Evangeliorum*, 1309); and a work on the Sacrament (*Tractatus de Idoneo Ministrante et Suscipiente Sancti Altaris Sacramentum*). An edition of his works in five volumes was published at Rome (1471-72), and one in six volumes at Antwerp (1634). Consult: Davidson, *Sacred Hermeneutics* (London, 1843); Graetz, *Geschichte der Juden* (11 vols., Leipzig, 1853-70); and for different editions, Graesse, *Tre-sor des livres rares et précieux* (Dresden, 1859-69).

NICHOLASVILLE, nîk'ô-las-vîl'. A city and the county-seat of Jessamine County, Ky., 83 miles east-southeast of Louisville, on the Cincinnati Southern and other railroads (Map: Kentucky, G 3). It is the seat of the Jessamine Female Institute, opened in 1854, and is an important tobacco market and the centre of extensive horse-breeding interests. The chief industrial plants are a large sawmill and wheel works. Nicholasville was settled in 1799, and was first incorporated in 1835. Population, 1890, 2157; 1900, 2393.

NICHOLL, nîk'ol, HORACE WADHAM (1848-). An Anglo-American musician, born at Tip-ton, near Birmingham, Eng. He was educated under native teachers, the most famous of whom was Samuel Prince, and after holding one or two local organ appointments moved to America and settled in Pittsburg. After 1878 he made his

home in New York. His compositions include: *Cloister Scene* (1874); symphonic poem *Tartarus* (1888); *Mass in E Flat*; and many other smaller orchestral and instrumental numbers. His most important work, a cycle of four oratorios, has remained in manuscript, the component works of which are named respectively *Adam*, *Abraham*, *Isaac*, *Jacob*.

NICHOLLS, nîk'olz, FRANCIS TILLON (1834—). An American politician and soldier, born at Donaldsonville, La. He graduated at West Point in 1855 and took part in the Seminole War, but resigned from the army in 1857 and returned to his native State, where he began the practice of law. At the outbreak of the Civil War he entered the Confederate service as a captain and rose to the rank of brigadier-general. In 1876 he was elected Governor of Louisiana, and was again elected in 1888. During his second administration occurred the suppression of the Louisiana Lottery. The lottery company succeeded in getting a bill granting it a new charter through both branches of the Legislature, but Governor Nichols vetoed the measure, whereupon the company appealed to the people and met with final defeat. In 1892 he became Chief Justice of the State Supreme Court.

NICHOLLS, RHODA (HOLMES) (?—). An English water-color painter and illustrator, born in Coventry, England. She was a pupil of the Bloomsbury School of Art in London and won the Queen's scholarship. In 1884 she removed to the United States, and afterwards settled in New York City, where she became a prominent member of the New York Water Color Club. Her work is strong, brilliant, and individual, and her figure and flower studies are particularly well known.

NICHOLS, nîk'olz, EDWARD LEAMINGTON (1854—). An American physicist. He was born at Leamington, England, and was educated at Cornell University, graduating in 1875. After studying at Leipzig, Berlin, and Göttingen, where he took the degree of Ph.D. in 1879, he was appointed fellow in physics at Johns Hopkins. He then spent some time in the Edison laboratory at Menlo Park, N. J., and in 1881 became professor of physics and chemistry in the Central University of Kentucky. In 1883 he was called to the chair of physics and astronomy at the University of Kansas, and in 1887 he was appointed professor of physics at Cornell University. He became editor of the *Physical Review* and prepared many papers on electricity and other branches of experimental physics as well as text-books dealing with these subjects.

NICHOLS, ERNEST FOX (1869—). An American physicist, born at Leavenworth, Kan. He graduated at the Kansas Agricultural College in 1888, and pursued graduate studies at Cornell University and Berlin University. He was professor of physics at Colgate University in 1892-93 and at Dartmouth College from 1898 to 1903, when he was made professor of experimental physics at Columbia University. His work in physics includes the remodeling and improvement of the Crookes radiometer; with H. Robens, the discovery and measurement of heat waves four times as long as any hitherto known; the measurement of the heat radiation from the stars Arcturus and Vega and the planets Jupiter and Saturn; and,

with G. F. Hall, the measurement of pressure due to radiation.

NICHOLS, JOHN (1745-1826). The last of the learned printers, born near London, February 2, 1745. He was apprenticed to William Bowyer (q.v.), and was taken into partnership (1766). On the death of his patron (1777) he succeeded to the business. He died November 26, 1826. For nearly fifty years Nichols devoted himself to writing, editing, and publishing valuable books. Among them are *A Supplement to Swift's Works* (1776, 1779); *Biographical and Literary Anecdotes of W. Bowyer* (1782); *The Progresses of Queen Elizabeth* (1778, with additions in 1805 and 1821); and *Literary Anecdotes of the Eighteenth Century* (1812-15). His son, JOHN BOWYER NICHOLS (1779-1863), was also a well-known printer and antiquary.

NICHOLSON, nîk'ol-son, EDWARD WILLIAMS BYRON (1849—). An English librarian and author, born at Saint Helier, Jersey, and educated at Oxford. He was librarian and superintendent at the London Institution from 1873 until 1882, when he became librarian at the Bodleian Library in Oxford. His publications include Gospel commentaries, *The Christ-Child and Other Poems* (1877); *The Rights of an Animal* (1879); *New Homeric Researches* (1883); *The Pedigree of Jack* (1892); *The Vernacular Inscriptions of the Ancient Kingdom of Alban* (1896); *Golapie* (1897); *The Man with Two Souls and Other Stories* (1898); and *The Language of the Continental Picts* (1900).

NICHOLSON, Sir FRANCIS (1660-1728). A British colonial governor and soldier in America. He was born in England, and in 1678 entered the army as an ensign. In 1684 he became a lieutenant and was sent to America, where in 1687 he was appointed deputy for New York of Sir Edmund Andros. Nicholson's administration of affairs in New York was weak and vacillating. In the spring of 1689, at the time of the Leisler rebellion (see LEISLER, JACOB), he was turned out of office, and returned to England, a new commission from William III. as Governor of the colony arriving soon after his departure. From 1690 to 1694 he was Lieutenant-Governor of Virginia, and administered the affairs of the colony with great ability. Although himself a dissolute rake, he endeavored, with considerable success, to improve the moral and intellectual condition of the people. He gave his attention to bettering the character and condition of the clergy, established for the first time a regular system of schools, and founded William and Mary College, to which he himself donated the sum of £300. In 1694 Lord Howard of Effingham, under whom Nicholson served as deputy, died, and when Andros was appointed to succeed him Nicholson, disappointed, resigned. He was pacified with the appointment to the Governorship of Maryland, where his failure to get along with the colonists was as conspicuous as his success in Virginia had been. In 1698 he returned to Virginia as Governor, but his second term was far less successful than the first. He caused considerable irritation and ill-feeling by his removal of the capital from Jamestown to Williamsburg. He was recalled in 1705. In 1709 and 1711 he made ineffectual attempts to invade Canada by leading an army northward from Albany by way of Lake Champlain. In 1710 he planned and commanded the expedition

which resulted in the capture of Port Royal, and in 1713 became Governor of Acadia. In 1719, the proprietary charter of South Carolina having been declared forfeited, Nicholson was appointed royal Governor. He was knighted in the following year, and remained in South Carolina until 1725. In the same year he attained the rank of lieutenant-general. He published an interesting account of the capture of Port Royal, entitled *Journal of an Expedition for the Reduction of Port Royal* (1711), reprinted by the Nova Scotia Historical Society in 1879; and *An Apology or Vindication of Sir Francis Nicholson, Governor of South Carolina* (1724).

NICHOLSON, JAMES (1737-1804). An American naval officer, born at Chestertown, Md. He was present at the capture of Havana in 1762, lived in New York from 1763 to 1771, then returned to Maryland, and in 1775 became captain of the American ship *Defense*. In March, 1776, he captured several British prizes; in June he was put in command of a twenty-eight-gun ship, the *Virginia*; and in October he was made ranking captain of the American navy. His vessel was confined for some time to Chesapeake Bay by a strict blockade, and during this period he and his crew took part as volunteers in the battle of Trenton. In January, 1777, he succeeded Commodore Esek Hopkins as commander-in-chief of the American navy, in which position he remained until the close of the war. Early in 1778, while he was attempting to leave Chesapeake Bay, his vessel ran aground and was captured, but he, with most of his crew, managed to escape. On June 2, 1780, in command of the *Trumbull*, of 38 guns, he fought a drawn battle with the British ship *Wyatt*, and in 1781, off the Delaware capes, after a stubborn resistance, he was captured by the *Iris* and *General Monk*. He was released at the close of the war, and returned to New York City, where he was appointed commissioner of loans.

NICHOLSON, JAMES WILLIAM AUGUSTUS (1821-87). An American naval officer. He was born in Dedham, Mass., entered the United States Navy as a midshipman in 1838, became a lieutenant in 1852, and in 1853-55 served on the *Vandalia* in Commodore M. C. Perry's Japan expedition. During the Civil War he commanded the steamer *Isaac Smith*, of the South Atlantic blockading squadron, in the battle of Hilton Head at Port Royal (November 7, 1861); was promoted to the rank of commander in 1862; was in the action with the Confederate flotilla on the Savannah River in the same year; commanded the monitor *Manhattan*, under Admiral Farragut, in the battle of Mobile Bay, and soon afterwards participated in the bombardment of Fort Morgan. In 1865-66 he commanded the steamer *Mohigan* in the Pacific Squadron; in 1873 was promoted to be commander; and from 1876 to 1880 was commandant of the Brooklyn Navy Yard. He became a rear-admiral in 1881, was placed in command of the European station in the same year, was present at the bombardment of Alexandria, Egypt, by an English fleet in 1882, and by his prompt and energetic measures did much to restore order thereafter. In 1883, having reached the age of sixty-two, he was retired from service.

NICHOLSON, JOHN (1821-57). A British general and administrator in India. He was born

in Dublin, December 11, 1821. At eighteen he received a cadetship in the Bengal infantry. In 1841 he fought heroically to defend Ghazni against the Afghans, but was taken prisoner and cruelly treated. His escape was followed by a period of inactivity, during which he was stationed at Meerut, doing duty as adjutant of his regiment. On the breaking out of the Sikh War in 1845, he served in the campaign on the Sutlej, and was present at the battle of Ferozshah, though he had no opportunity to distinguish himself. After the war, through the recommendation of Colonel Lawrence, Nicholson, now a lieutenant, was appointed assistant to the Resident at the conquered capital, Lahore, and thus fairly transferred to the political branch of the service, in which most of his future life was passed. But with the outbreak of the Sikh rebellion in 1848 came an interlude of military activity, in which he greatly distinguished himself. At the battles of Chillianwalla and Gujrat he earned the approval of Lord Gough, to whom he was immediately attached.

When the Punjab finally became a British province, Captain Nicholson was appointed deputy commissioner under the Lahore Board, of which Sir Henry Lawrence was president. During a furlough, 1850 to 1851, he studied military affairs in the great European capitals. For five years after his return to India he was engaged in administrative duties among the savage tribes of the Punjab. His success in bringing them under thorough subjection to law and order was very great; and such was the impression of fear and reverence wrought by the force and personality of the man, that he became among these rude populations, under the title of 'Nikkul Seyn,' the object of a curious kind of hero-worship. In the great mutiny of 1857 he did noble service for England in helping save the Punjab. When everything was safe behind him, he marched to reinforce the army of General Wilson, engaged in the siege of Delhi. His presence and counsels gave new life to the operations, and in every way he strove to expedite the delayed assault. When the attack on the city was at last ordered, General Nicholson, as he was now, led the first column. As the troops forced their way into the city, Nicholson exposed himself fearlessly to animate his men. Conspicuous by his great stature, he became the mark of the enemy's bullets and fell, shot through the body. After great suffering he died September 23, 1857. Consult: Kaye, *Lives of Indian Officers* (London, 1867); id., *History of the Sepoy War in India* (ib., 1867); Malleon, *History of the Indian Mutiny* (ib., 1897); Trotter, *Life of John Nicholson, Soldier and Administrator, Based on Private and Hitherto Unpublished Documents* (ib., 1897).

NICHOLSON, JOSEPH SHIELD (1850-). An English economist, born in Lincolnshire. He studied at the universities of Edinburgh, Cambridge, and Heidelberg. He was private tutor at Cambridge, 1876-1880, and became professor of political economy at the University of Edinburgh in 1880. His writings represent a compromise between the methods of the historical school of German economics and those of the English deductive school. In his principal work, *Principles of Political Economy* (3 vols., 1893-1901), he closely follows the great work of John Stuart Mill in his selection of material, but employs sta-

tistical and historical discussion instead of the abstract reasoning from simple assumption which characterizes Mill's works. His other important works on economic subjects are: *Effects of Machinery on Wages* (1878); *Tenant's Gain Not Landlord's Loss* (1883); *The Silver Question* (1886); *Money and Monetary Problems* (1888); *Historical Progress and Ideal Socialism* (1894); *Strikes and Social Problems* (1896). He is also author of three romances: *Thoth* (1888); *Dream of Dreams* (1889); and *Towar* (1890).

NICHOLSON, LOUISA MARGARET. An American singer, better known by her professional name, Louise Nikita (q.v.).

NICHOLSON, WILLIAM (1872—). An English painter and wood engraver, born at Newark-upon-Trent. He studied with Herkomer and under Bouguereau and Constant in Paris, but these masters had little influence upon him. After his return to London, he and his brother-in-law, James Pryde, began to design posters under the name of the Beggarstaff Brothers. The technical skill shown in these works, their originality and boldness, attracted considerable attention. They are done in black and white with usually a dash of color. His publications include: *An Alphabet* (1898); *An Almanac of Twelve Sports* (with Rudyard Kipling, 1898); *London Types* (with W. E. Henley, 1898); and *Characters of Romance* (1900). In portraiture he is particularly successful. His best cuts are Queen Victoria, Whistler, Bernhardt, Kipling, and Earl Roberts.

NICIAS, nish'i-as (Lat., from Gk. *Nicias*, *Nikias*). A famous Athenian statesman and general during the Peloponnesian War. He was the son of Niceratus, a very wealthy citizen, who had acquired his fortune by working the silver mines at Laurium. Nicias belonged to the aristocratic party, and after the death of Pericles presented himself as the opponent of Cleon, the great popular or demagogic leader. The opposite in character to Alcibiades, he was wary, cautious, obstinate, and irresolute. He was generally successful in his enterprises against the Spartans and their allies. In B.C. 427 he captured the island of Minoa; in the following year he ravaged the island of Melos and the coasts of Locris; and in B.C. 424 he captured the island of Cythera and ravaged the coast of Laconia. After the death of Cleon he brought about a peace between the Spartans and Athenians, B.C. 421, called the Peace of Nicias. Six years afterwards the Athenians, at the instigation of Alcibiades, resolved on a great naval expedition against Sicily. Nicias was appointed one of the commanders, although he had strongly protested against the undertaking. In the autumn of B.C. 415 he laid siege to Syracuse, and was at first successful, but subsequently experienced a series of disasters; his fleet was destroyed, and his troops began a retreat toward the interior of Sicily. They were speedily forced to surrender, and Nicias was put to death, B.C. 413. Consult the *Histories of Greece* by Grote, Curtius, Holm, Beloch, and Eduard Meyer; also Plutarch's "Life of Nicias."

NICKEL (Swed. *nickel*, connected perhaps with Ger. *Nickel*, devil, cf. the etymology of *cobalt*; according to others connected with Icel. *hníkill*, ball, lump). A metallic element discovered by Cronstedt in 1751. It was first men-

tioned in 1694 by Hiarni, who called it *kopparnickel*, signifying false copper, because, while its ores resembled those of copper, that metal could not be extracted from them. Cronstedt successfully isolated the metal, but it was not until Bergman in 1774 corroborated his investigations that its distinct nature was recognized. Nickel is a constituent of all meteoric irons, and it has been detected spectroscopically in the atmosphere of the sun. On the earth it occurs, usually associated with cobalt, in *niccolite*, *gersdorffite*, *millerite*, *garnierite*, and certain other minerals. The wide distribution of the sulpharsenide ores led to their extensive working in Saxony, Norway, Sweden, Austria, Spain, Russia, Great Britain, and the United States, but since the discovery of garnierite in New Caledonia in 1873, and the development of the nickeliferous pyrrhotite in Sudbury, Ontario, Can., subsequent to 1887, these two localities have become the principal sources of nickel.

Nickel (symbol, Ni; atomic weight, 58.69) is a silver-white lustrous metal that is magnetic at ordinary temperatures, is ductile, hard, and tenacious, has a specific gravity of from 8.97 to 9.26, and a melting-point of about 1450° C. Next to manganese it is the hardest of the metals, and it is capable of taking a fine polish. Fleitman has found that on adding a small quantity of magnesium to fused nickel the latter can be rolled into very thin sheets and welded on to sheet iron or steel so as to permit its use for the manufacture of culinary or other utensils. Nickel thus treated may be drawn into wire and also cast or forged. The chief use of nickel is in the manufacture of alloys, including German silver. There is an important alloy of nickel and steel which is used for armor plate and other heavy forgings. Nickel is also employed as a material for making coins in Switzerland, Belgium, Germany, the United States, and other countries. Nickel combines with oxygen to form two oxides. The monoxide, NiO, is a grayish-green substance found native as bunsenite. It may be made by strongly heating the hydroxide, carbonate, or nitrate. The sesquioxide of nickel, Ni₂O₃, is a black substance obtained by heating the nitrate or carbonate in the air. The most important commercial salt of nickel is ammonium-nickel sulphate, which is obtained by dissolving either metallic nickel or its protoxide in sulphuric acid and adding ammonium sulphate to the concentrated acid solution, which is then evaporated to crystallization. The crystals, which are of a bright green color, may be further purified by recrystallization and find their chief use in nickel plating. The carbonate may also be used for electro-plating. Nickel salts, when hydrated or in solution, have a fine emerald green color, but are yellow when anhydrous. In 1889, 252,663 pounds of nickel, valued at \$151,598, were produced from ores mined in the United States. In 1902 there was no nickel mined, the ore smelted being derived entirely from Canada and New Caledonia.

METALLURGY. When nickeliferous ores of lead, cobalt, copper, or silver containing arsenic are smelted, the nickel combines with the arsenic to form speiss; should arsenic not be present, the nickel enters the various intermediate products of the smelting process, such as matte, blister copper, tough pitch copper, and dyes. From all these

metallurgical products nickel may be extracted as well as from the ores. The principal ores from which nickel is extracted are the sulphur compounds and the silicates. The chief sulphur compounds are the nickel pyrites of iron and copper, of which one of the most notable deposits is at Sudbury, Canada. The Sudbury ores are the principal source of the world's nickel supply.

The extraction of nickel is performed by (1) the dry method, (2) the wet method, and (3) electro-metallurgically. The dry method is the one chiefly used to extract the metal from the ores, the use of the wet method and electro-metallurgical processes being confined almost entirely to extraction from metallurgical products and the matte and speiss resulting from the dry processes. Most attention will therefore be given to the dry method of extraction as applied to the principal ore of nickel; that is, the combined nickel, iron, and copper pyrites. In smelting these ores in the dry way, after getting rid of the gangue, the metallurgist is chiefly concerned with the separation of the nickel from the sulphur, iron, and, in most cases, from the copper also. When no copper is present the process becomes simple. Considering first ores free from copper, the task is to get rid of the iron and sulphur. The first operation consists in roasting the ore, which converts the metallic sulphides into a mixture of oxides, sulphates, and undecomposed sulphides. The roasted ore is then smelted in a shaft furnace with coal and siliceous matter, which removes the great bulk of the iron as slag, leaving a matte consisting of sulphide of nickel mixed with a small proportion of iron sulphide. Generally, to get a matte rich enough in nickel for the succeeding operations, these roasting and smelting processes are repeated one or more times. The raw nickel matte is next submitted to an oxidizing fusion in hearths, reverberatory furnaces, or converters to remove the remaining iron, leaving nickel sulphide. When copper is present in the ores as well as iron, the iron is removed exactly as before, the result being, however, a matte of nickel sulphide and copper sulphide mixed. This matte may be oxidized by roasting and then smelted to produce a nickel-copper alloy, or to secure nickel alone the matte is smelted with a flux, which removes the copper, or is treated with chemicals, which permit the separation of the copper. This latter method is the chief use made of the wet method of reduction, which, as previously stated, is used mostly for reducing the mattes, speiss, and slags resulting from the smelting process. As in wet methods of extraction generally, the process in the case of nickel consists in dissolving the metals from the matte, etc., by acids, and then in precipitating separately the various metals from this solution. The nickel compounds resulting from the processes mentioned are reduced to metallic nickel by smelting in crucibles with carbon. See Dr. Carl Schnable's *Handbook of Metallurgy* (New York, 1898).

NICOBAR (nik'ô-bâr') **ISLANDS.** A group of islands in the Indian Ocean beginning 130 miles northwest of Sumatra and stretching northwestward for 200 miles (Map: French Indo-China, B 6). They form with the Andaman Islands to the north of them the northern extension of the great chain of islands of which

Sumatra and Java are the principal members. The group consists of 19 islands, of which 12 are inhabited, the largest being Great and Little Nicobar in the south, Camorta in the centre, and Car Nicobar in the north. The area of Great Nicobar, the largest, is 337, and of the whole group 684 square miles. The southern islands are mountainous and covered with dense forests; those in the north are low, less fertile, but supporting large numbers of cocoa-palms. The climate is hot, humid, and very unhealthful for Europeans. The Nicobarese are classed with the Selungs of the Mergui Archipelago as Indonesians. The inhabitants of the smaller islands and of the coast of Great Nicobar have intermixed with Malays. In all probability they belong originally to one of the primitive stocks of Farther India (proto-Malay?) with Negrito and Malay admixtures. The northern Nicobarese are monogamous and value chastity very highly. In 1901 the inhabitants numbered 6310. They are chiefly supported by their large trade in cocoanuts and copra. Formerly they were engaged in piracy and wrecking, but have been peaceful since the British occupation. The islands are, together with the Andamans, governed by a British chief commissioner. The British Government agent resides at Nancowry Harbor, where there is a fine land-locked harbor between Camorta and Nancowry islands. The Nicobar Islands were settled by Denmark in 1756, but her attempts at colonization were unsuccessful, and she abandoned them in 1848. In 1869 they were annexed by Great Britain.

NICOBAR PIGEON. A large and very beautiful ground-feeding pigeon of the East Indies (*Calenas Nicobarica*), which is remarkable for the elongated feathers that mantle the neck, and for its very wide distribution over the Polynesian region. Consult Wallace, *Malay Archipelago* (New York, 1869).

NICODEMUS (Lat., from Gk. *Nikodēmos*, *Nikodēmos*). A Jew described in the Gospel of John as a Pharisee and member of the Sanhedrin, who came to Jesus secretly and by night at Jerusalem (John iii. 1 sqq.). He put in a plea for a hearing for Jesus when the Pharisees would have condemned Him without allowing Him to plead (John vii. 50); and he bore a part with Joseph of Arimathea in burying the body of Jesus (John xix. 39). He disappears from the New Testament after the burial. In an apocryphal book, the Gospel of Nicodemus, or Acts of Pilate, the few facts recorded in the Gospels are elaborated and commented on at considerable length, evidently with no basis of historic truth behind them. See APOCRYPHA.

NICOL, nik'ol, **ERSKINE** (1825-1904). A Scotch painter, born at Leith, near Edinburgh. He studied at the Trustees' Academy, Edinburgh, and then went to Dublin, where he taught and painted portraits. In 1859 he was elected associate of the Royal Academy, and in 1863 went to live in London. His works are genre, generally of Irish subjects, and many of them are well known in the United States through engravings. Among the best known are "Paddy's Mark," in the Corcoran Gallery, Washington; "Paying the Rent," in the Vanderbilt Collection, New York.

NICOLA, LEWIS (1717-c.1807). An American soldier, born in Dublin, Ireland. He became

ensign in the British army in 1740, and afterwards major. He resigned and came to Philadelphia about 1766, and was employed in civil engineering. In 1776 he was made barracks-master of the city and aided in preparing for defense. In December, 1776, he was made town major with State rank, and he held this place until 1782. He presented to Congress a plan for an invalid regiment, which should serve both as a home guard and a training school, was made the colonel in June, 1777, and was brevetted brigadier-general in 1783. He was an original member of the Pennsylvania branch of the Society of the Cincinnati and wrote to Washington for the army officers the famous letter suggesting that the latter become King of the country. He published *A Treatise of Military Exercise Calculated for the Use of Americans* (1776).

NICOLAI, *nik'ó-li*, CHRISTOPH FRIEDRICH (1733-1811). A well-known German littérateur, born in Berlin. From 1752 he directed a publishing and bookselling establishment, which he made one of the largest in Berlin. He became (1754) a member of a literary circle which included Lessing and Moses Mendelssohn, with the latter of whom he established at Berlin in 1757 the *Bibliothek der schönen Wissenschaften* (conducted from vol. v., 1760, by C. F. Weisse at Leipzig), designed as an independent critical journal. He also collaborated with Mendelssohn and Lessing (whose place was later taken by Thomas Abbt) in the *Briefe die neueste Litteratur betreffend* (1761-67), a literary review presented as letters addressed to a supposititious officer, wounded in the Seven Years' War. Another periodical, the *Allgemeine Deutsche Bibliothek* (106 vols., 1765-91; with a continuation, in all 162 vols., 1805), he made known chiefly for its harshness and insipidity. A rationalist in philosophy, he wrote *Sebalduß Nothanker* (1773), rather a heterodox monograph than the work of fiction it purported to be, and bitterly attacked Kant, Fichte, and the critical school in general. He attempted to cast ridicule upon most of what was significant in the German literature of the time, for example, the work of Goethe and Schiller, who made spirited reply in the *Xenien*, and that of G. A. Bürger, against whose revival of the ballad form he directed his *Feyner kleynere Almanach vol schönerr, echterr, liblicherr Volkslieder* (1777-78; new ed. 1887). Yet in earlier critiques he worked effectively toward the improvement of taste; and his *Anekdoten von Friedrich II.* (1788-92) is of permanent historical value. Consult Göckingk, *Nicolaïs Leben und litterarischer Nachlass* (Berlin, 1820). See also GERMAN LITERATURE.

NICOLAI, OTTO (1810-49). A German musical composer, born at Königsberg in 1810. His early life was a struggle with poverty and difficulties, and although his first lessons in music were given to him by his father, the lack of sympathy between them, and the oft repeated brutality of the elder, caused the boy to run away from home (1826), and find a patron in Adler of Stargard, by whose aid he was enabled to complete his studies. He studied for three years in Berlin under Klein; and in 1835 went to Rome, where he went through three more years of study under Baini. After traveling for ten or twelve years over Europe, he became in 1847 kapellmeister at Berlin, a post which he soon re-

signed. He appeared as a composer of dramatic music as early as 1831; but his first work of importance was *Il Templario*, founded on Scott's romance of *Ivanhoe*, which, produced at Turin in 1841, attained a high and permanent reputation. In 1848 he wrote at Berlin *Die lustigen Weiber von Windsor*, on which his renown as a musician is founded, a work charming for its clear design and lively, vigorous tone. Two months after the production of this, his *chef-d'œuvre*, its composer died, in Berlin.

NICOLAÏTANS (Gk. *Nikolaítai*, *Nikolaítai*). Representatives of a form of false teaching and loose moral practice, mentioned only in Revelation ii. 6, 15, and in early Christian literature bearing on these passages. Among the early references is the following by Irenæus (*Against Heresies*, i. 26): "The Nicolaitans are the followers of that Nicolas who was one of the seven first ordained to the diaconate by the Apostles. They lead lives of unrestrained indulgence. The character of these men is very plainly pointed out in the Apocalypse of John, [where they are represented] as teaching that it is a matter of indifference to practice adultery and to eat things sacrificed to idols." They evidently carried to an illogical and immoral extreme the principles of religious freedom from legal requirements taught by Saint Paul. Certain critics have seen in these references of the Apocalypse an allegorical portrayal of Paul's teachings by those to whom they were repugnant. Most scholars, however, find no warrant for this. The Nicolaitans were among the obscure early Gnostic heretics who offended chiefly in violating the decree of the Council at Jerusalem (Acts xv. 29), which forbade participation by Christians in the heathen feasts and in the licentiousness by which these celebrations were commonly attended. That they were personal followers of Nicolas or Nicolaus of Antioch (Acts vi. 5) has not been proved. Their name (in Greek, 'conqueror of the people') closely resembles the name Balaam (in Hebrew, 'destroyer of the people'), whence it has been argued that no such sect really existed, but the close association of the terms in the Apocalypse is a part of its allegorical method. There is no reasonable warrant for the conjecture. The sect was insignificant and disappeared. Other sects called Nicolaitans are met with in the Middle Ages; one flourished in the fifteenth century in Bohemia; these have no connection with the party mentioned in the Apocalypse. Consult the commentaries on Revelation, and McGiffert, *A History of Christianity in the Apostolic Age* (New York, 1897).

NICOLAS, Sir NICHOLAS HARRIS (1799-1848). An English antiquary, born at Dartmouth. In 1823 he published his *Index to the Herald's Visitations in the British Museum*. His labors also resulted in the reform of abuses which had crept into the administration of the record commission, the Society of Antiquaries, and the British Museum. Among his publications are: *Observations on the State of Historical Literature and on the Society of Antiquaries, with Remarks on the Record Commission* (1830); *Synopsis of the Peerage of England* (1825; new ed. revised by William Courthope. 1857); and *History of the Battle of Agincourt* (3d ed. 1833).

NICOLAÏUS (Lat., from Gk. *Nikólaos*, *Nikolaos*) **OF DAMASCUS**. A Greek historian of the

first century B.C., an intimate friend of Herod the Great and of Augustus. His numerous works include his autobiography, of which a considerable portion remains; a history of the world down to his own times in 144 books, of which fragments have been preserved; and a panegyric biography of Augustus, of which some extracts, made by command of Constantine Porphyrogenitus, are extant. He also wrote commentaries on various philosophical works, and several tragedies and comedies. A fragment of one of the tragedies has been preserved by Stobæus. For the fragments, consult: Müller, *Fragmenta Historicorum Græcorum* (5 vols., Paris, 1841-70); also, Trieber, *De Nicolai Damasceni Laconicis* (Berlin, 1867); and Steinmetz, *Herod and Nicolaus* (Lüneburg, 1861).

NICOLAY, n'k'ô-lâ, JOHN GEORGE (1832-1901). An American author, born in Essingen, Bavaria, February 22, 1832. He came to the United States in 1838, attended school in Cincinnati, Ohio, and later went to Illinois, where he edited the *Pike County Free Press*, at Pittsfield. Then he became assistant to the Secretary of State of Illinois, and while in this position met Abraham Lincoln. He served as private secretary to Lincoln during the Civil War (1861-65), and after the death of the President became United States Consul at Paris, France (1865-69). He was marshal of the United States Supreme Court (1872-87). Besides contributions to the leading magazines, his writings include books on the Civil War and on Lincoln, *The Outbreak of the Rebellion* (1881), and jointly with John Hay (q.v.) *Abraham Lincoln: A History*. This authoritative work appeared in the *Century Magazine* serially from 1886 to 1890, and was then issued in book form, together with the *Complete Works of Abraham Lincoln*, in 12 volumes (1890-94).

NICOLE, nê'kôl'. In Molière's *Bourgeois gentilhomme*, a bright servant who with Madame Jourdain exposes and ridicules the foibles of her master.

NICOLE, PIERRE (1625-95). A distinguished French Jansenist writer. He was born at Chartres, and at an early age attained unusual proficiency in classical studies, at first under the teaching of his father, a counselor in the Parlement of Paris. From 1642 to 1644 he studied philosophy in Paris, where he took his master's degree. Inclined to take holy orders, he made a theological course at the Sorbonne in 1645-46. He was already under the influence of the Jansenist leaders, especially Antoine Arnauld, and after taking his bachelor's degree in theology went to Port Royal in 1649. Five years later he returned to Paris and devoted his talents to promoting the cause of Jansenism. In 1679 his outspoken opposition to the ruling doctrines made it advisable for him to accompany Arnauld to the Low Countries, where he lived at Brussels, Louvain, and elsewhere until he got permission to return to Chartres, and in 1683 to Paris, where he died. He wrote a large number of controversial treatises, all characterized by purity of style and subtlety of discrimination. To him is due the principal part of the celebrated Port Royal logic—*La logique, ou l'art de penser* (Paris, 1662; Eng. trans. ed. T. S. Baynes, 10th ed., London, 1898). His *Essais de morale* (6 vols., 1671 seq.) is his most important work; it

was continued in a new edition with life by C. P. Goujet (14 vols., Paris, 1767-82).

NICOLINI, nê'kô-lê'nê, ERNESTO (properly ERNEST NICOLAS) (1834-98). A French singer, born at Saint-Malo. He studied at the Conservatory, and made his début in the *Mousquetaires de la reine* at the Opéra Comique in Paris in 1857. Afterwards, he traveled extensively, and did not reappear in Paris until 1870. While in Saint Petersburg on another tour he renewed an acquaintance with Mme. Adelina Patti, whom he married after her divorce from the Marquis de Caux in 1886.

NICOLL, JAMES CRAIG (1847—). An American painter, born in New York. He studied under M. F. H. de Haas and Kruseman van Elten, and in 1885 was elected a National Academician. His marines include: "On the Rocks Near Portland" (1882), "Twilight," "Sunlight on the Sea," "Fog and Sunshine," and "On the Gulf of Saint Lawrence."

NICOLL, WILLIAM ROBERTSON (1851—). A British author and journalist, born at Lumsden, Aberdeenshire, Scotland, October 10, 1851. He was educated at the university and the Free Church College at Aberdeen; was a minister at Duftown (1874-77), and at Kelso (1877-85). In 1884 he became the editor of the *Expositor*; in 1886 of the *British Weekly*, which he founded; and in 1891 of the *Bookman*, which he also founded. He has written: *The Incarnate Saviour* (1881); *The Lamb of God* (1886); *The Key of the Grave* (1893); *Literary Anecdotes of the Nineteenth Century* (1895); and, jointly with C. K. Shorter, a new *Life of the Brontës* (1895); besides editing a number of theological works.

NICOLLET, nê'kô-lâ', JEAN NICOLAS (1786-1843). A French astronomer and explorer, born at Cluses in Savoy. When about twenty-one years old he went to Paris and became a naturalized Frenchman. In 1817 he secured a position in connection with the observatory, and in 1822 was promoted to be assistant astronomer in the Bureau of Longitudes. He discovered at the same time as Pond the comet of 1821, and in 1822-23 was engaged with Colonel Broussau in measuring an arc of latitude in the south of France. Obligated to leave the country in 1831 because of unfortunate speculations, he went to the United States, where the Government gave him some assistance in making a geographical and geological exploration of the territory beyond the Mississippi. The results of these researches are embodied in a series of memoirs which appeared in the *Connaissance des Temps* and Silliman's *Journal*. Among his other publications are: *Des assurances sur la vie* (1818); *Cours de mathématiques* (1830); and a *Report and Map of the Hydrographical Basin of the Upper Mississippi River* (1843). Consult Sibley, "Mémorial of Jean N. Nicolle," in the *Collections of the Minnesota Historical Society*, vol. i. (Saint Paul, 1872).

NICOLLS, nîk'ôlz, MATHIAS (c.1630-87). An English colonial official, born at Plymouth. He was admitted to the bar, and in 1664 was appointed by Charles II. secretary of the commission headed by Col. Richard Nicolls (q.v.), which was to regulate New England and capture New Netherland. He became the first Secretary of New York after the English occupation (Sep-

tember 8, 1664), and was appointed a member of the Governor's Council. He drew up, under the supervision of Governor Nicolls, a code from the English, the Roman-Dutch, and the local laws of New England, which was promulgated at Hempstead in October, 1664, and was later known as the 'Duke's Laws.' In the Court of Assizes provided in this code, he was the presiding justice, and in 1665 was appointed judge of the Admiralty Court. He also served as captain of the militia and led some expeditions against the Indians. Though deposed as secretary when the Dutch recaptured the province in 1673, he was reappointed by Andros in 1674, and was elected mayor of the city as well. In 1680 he resigned all his offices and went to England. Upon his return he was appointed one of the two judges of the Court of Oyer and Terminer in 1683. During that year and the next he was Speaker of the First Assemblies of the Province. He bought and entered much land in Queens County, and died on his estate, Plandome.

NICOLLS, RICHARD (1624-72). A British soldier and colonial Governor. During the Civil War he commanded a troop of horse on the Royalist side. He followed the Stuarts into exile and served with the Duke of York under Marshal Turenne. After the Restoration, he was groom of the bedchamber for the Duke of York. In 1664 Charles II. appointed a commission, consisting of Colonel Richard Nicolls, Sir Robert Carr, Sir George Cartwright, and Samuel Maverick, to investigate complaints against the New England colonies, and reduce the Dutch in New Netherland, which had been granted to the Duke of York. Colonel Nicolls's presence was to be necessary for a quorum, and he was commissioned as Deputy Governor of the territory to be captured. After touching at Boston, he appeared before New Amsterdam, August 25, 1664, and on September 8th Governor Stuyvesant was forced to surrender. Governor Nicolls assumed authority over New York and New Jersey. He made no radical changes, was firm, yet conciliatory, and soon won the respect and confidence of the people and the good-will of the Indians. In March, 1665, he published the 'Duke's Laws,' which had been drawn up under his supervision (see **NICOLLS, MATTHIAS**), and which served for a time as a constitution. On June 12, 1665, he established the English form of municipal government for the city of New York. The French and Indian troubles of 1686 were settled with credit, but he complained that he had spent much money from his private purse to maintain the establishment. He asked several times to be relieved, and in 1667 his petition was granted, but he remained until Governor Lovelace arrived, in August, 1668. His time had been so fully occupied with affairs in New York that he largely left the management of New England to the other commissioners. When war broke out between the English and the Dutch, he served on shipboard and was killed at Solebay.

NICOL PRISM. A prism formed from a crystal of calcite devised by Nicol in 1828 to polarize light. The Nicol prism, which has undergone various modifications, is a most convenient source for obtaining polarized light, and is largely employed in many forms of polariscope. The accompanying diagrams will show its construction. In Fig. 1 A G B F D E C is a rhomb of calcite,

a material which is doubly refracting (see **LIGHT**, paragraph on *Polarization*), while Fig. 2 shows diagrammatically a section of a Nicol prism in the plane A B C D. In the natural crystal the angle B A D is 71° , but in the prism this is made 68° , and the two halves of the crystal forming the prism are cemented together with Canada balsam along the line B D, which makes an angle of 90° with B A. The plane of the bal-

FIG. 1. RHOMB OF CALCITE.

FIG. 2. NICOL PRISM.

sam is perpendicular to the end of the face of the prism. Under these conditions the ray of light falling upon the prism at H is broken by double refraction into two rays—the extraordinary, which travels to J and passes out of the prism and is available for experimentation, and the ordinary, which strikes the balsam at an angle of incidence so great that it is totally reflected at I and lost on the side of the prism. The plane of the polarization of the extraordinary ray is perpendicular to the plane of the diagram, while that of the ordinary ray is parallel to it. See **POLARISCOPE**; **LIGHT**.

NICOMACHUS, *ni-kōm'a-ktūs* (Lat., from Gk. *Νικόμαχος*, *Nikomachos*). A celebrated painter of the fourth century B.C., a son and scholar of Aristides. The references to him praise his mastery in technique, and rapid but effective execution. The notices, however, throw but little light upon his style. His works are known only from a particular list in Pliny (*Hist. Nat.*, xxxv., 108, cf. 145). Among them were: "The Rape of Proserpine," in the temple of Minerva, on the Capitol; "Victory Conducting a Four-Horse Chariot on High," also in the Capitol; "Apollo and Diana," "Cybele on a Lion," "Bacchantes Approached by Satyrs," and "Scylla."

NICOMACHUS (c. 100 A.D.). A Neo-Pythagorean philosopher and mathematician, born at Gerasa, probably in Judæa. He wrote an arithmetic in two books, of which the best edition is that of Hoche (Leipzig, 1866). In this he fully treated the theory of figurate numbers, and it is interesting as containing the first known multiplication table. Commentaries on this work were written by Iamblichus (q.v.), Philoponus, Soterichus, and others, and it was translated into Latin by Boëthius and Apuleius. He also wrote a *Harmonices Manuale* (published in 1652; French trans. 1880), of which the first book is still extant; the so-called second book, consisting of two fragments which probably did not belong to the original, was published in Jans's *Musici Græci* (Leipzig, 1895).

NICOMEDIA (Lat., from Gk. *Νικomedεία*, *Nikomèdeia*). The capital of ancient Bithynia, situated at the northeastern angle of the Gulf of Astacus, in the Propontis, now called the Bay of Ismid; founded in B.C. 264 by Nicomedes I. after

the destruction of Astacus (on the opposite side of the bay) by Lysimachus. Nicomedes made it the capital of the kingdom, and it soon became one of the most magnificent and flourishing cities in the East. Some of the later Roman Emperors, as Diocletian and Constantine the Great, selected it for their temporary residence. It suffered greatly both from earthquakes and the attacks of the Goths. Constantine died at a royal villa in the immediate vicinity. Hannibal committed suicide in a castle close by. It was the birthplace of the historian Arrian. The small town of Ismid or Isnikmid now occupies its site, and contains many relics of ancient Nicomedia.

NICOPOLIS (Lat., from Gk. *Nικηπολις*, *Nikopolis*). A town in Epirus, where Paul, in writing to Titus, stated that he designed to pass the winter (Titus iii. 12). It was founded in the year B.C. 31 by the Emperor Augustus, who named it the 'City of Victory,' in commemoration of the victory won by him at Actium. He decided to make a great city of Nicopolis, gathered a large population into it, and instituted games which drew throngs there every fourth year. The question of Paul's visit to Nicopolis is bound up with the authenticity of the pastoral Epistles (i.e. the two letters to Timothy and the one to Titus, qq.v.). Those who hold these to be authentic believe that Paul reached Nicopolis from Rome, preached there, and was there arrested for the second time and sent to Rome, where he was tried a second time and condemned. The original site of Nicopolis is now deserted. Remains of it are still to be found. Another city, Prevesa (Map: Balkan Peninsula, C 5), situated about five miles distant from the original location of Nicopolis, is the historical successor of the older city.

NICOPOLIS. A town of Bulgaria. See **NIKO-POLI**.

NICOSIA, *nē-kō-sē'ā* (more common than the forms *LEFKOSIA* and *LEVKOSIA*, of which it is a corruption). The capital and largest city of the island of Cyprus (Map: Turkey in Asia, E 5). It is the seat of the British High Commissioner and of an archbishop of the Greek Church. It is situated in a barren plain, a little northeast of the centre of the island, on the river Pedias, which is dry most of the year. The water supply of the city comes by aqueduct from the hills not far away. From a distance the high walls built by the Venetians and the beautiful Gothic cathedral, now a mosque, render Nicosia attractive; but the streets are narrow and labyrinthine, and most of the buildings insignificant. The manufactures are silks, leather, and woolen stuffs. Population, in 1891, 12,515; in 1901, 14,752. The city first appears in history in the time of Constantine, who fortified it with walls that lasted until the Venetians replaced them. It became the capital under the Lusignan kings, to the first of whom, Guy de Lusignan, the island was given in 1193 by Richard Cœur de Lion. Consult *Levkosia, the Capital of Cyprus* (London, 1881).

NICOSIA, *nē-kō-zē'ā*. A city in the Province of Catania, Sicily, situated in a mountainous region, on the Salso, 25 miles northeast of Caltanissetta (Map: Italy, J 10). The town is mediæval in appearance and customs. It is the see of a bishop, and has a Gothic cathedral, several ancient churches, and quaint houses. It

carries on some trade in corn, wine, oil, and cattle. Near it are beds of alum, a rich mine of rock salt, and springs of petroleum. Population (commune), in 1901, 18,004.

NICOT, *nē-kō'*, **JEAN**, Sieur de Villemain (1530-1600). A French diplomat, born at Nîmes. He was appointed by Francis II. Ambassador to Portugal in 1560. During his residence at Lisbon he obtained from a Flemish trader some seeds of the tobacco plant, which he took back with him to France, where the plant was named *Nicotiana* in his honor. He published a *Historia Francorum* (1566), and a *Trésor de la langue française* (1606), one of the earliest French dictionaries.

NICOTERA, *nē-kō'tā-rā*, **GIOVANNI** (1828-94). An Italian statesman, born at San Biase (Calabria). He took an active part in the Revolution of 1848-49, fought in Calabria and Rome, and was afterwards taken prisoner at Sanza and condemned to death. Through the influence of England this sentence was commuted to imprisonment for life. In 1860 he was set at liberty again, and joined Garibaldi. He was concerned in all of the political movements of the succeeding years, and was at all times a supporter of Victor Emmanuel. After the establishment of the Kingdom of Italy, he was Minister of the Interior under Depretis (1876-77), and again during the Premiership of Rudini (1891-92).

NICOTIANA. See **TOBACCO**.

NICOTINE (Fr. *nicotine*, Sp. *nicotiana*, from Fr. *nicotiane*, tobacco, named in honor of Jean Nicot), $C_{10}H_{14}N_2$. One of the vegetable alkaloids that contain no oxygen; it constitutes the active principle of the tobacco plant, in the leaves, roots, and seeds of which it occurs in combination with malic and citric acids. The smoke of burning tobacco-leaves contains but a mere trace, if any, of nicotine; which does not prove, however, that tobacco smoke is harmless, for its other ingredients are probably more or less injurious to health. Nicotine is a colorless, intensely poisonous liquid, of specific gravity 1.027 at 66° F.; it boils at 466° F. (241° C.), evolves a very irritating odor of tobacco, especially on the application of heat, is very inflammable, and burns with a smoky flame. It is moderately soluble in water, but dissolves readily in alcohol and ether. If exposed to the air, it absorbs oxygen and becomes brown and ultimately solid. The quantity of nicotine contained in tobacco varies from 2 to 8 per cent.; the coarser kinds containing the larger quantity, while the best Havana cigars seldom contain more than 2 per cent., and often less. Turkish tobacco scarcely contains any nicotine at all.

The principal physiological effects of even minute doses of nicotine are as follows: intense gastro-intestinal irritation, among the symptoms of which are nausea and vomiting, accompanied by great muscular weakness, a rapid, feeble pulse, coldness of extremities, and extreme general collapse; the motor nerves and the respiration are rapidly paralyzed, and death may ensue within three minutes after taking a dose of the poison. See also **ALKALOIDS**.

NICOYA, *nē-kō'yā*, **GULF OF**. An inlet of the Pacific Ocean, on the west coast of Costa Rica, formed by a peninsula ending in Cape Blanco

(Map: Central America, E 6). It is about 60 miles long and 20 to 30 miles wide, and is lined on both sides with high and picturesque mountains. On its eastern shore lies Punta Arenas, the only port of entry on the Pacific coast of Costa Rica.

NICHEROY, nêk'tâ-roî'. A town of Brazil, in the State of Rio de Janeiro. It is situated on the east side of the entrance to the bay, opposite the city of Rio de Janeiro (Map: Brazil, J 8). The town is not attractive, but it is surrounded by delightful suburbs, where the residences of the wealthy classes are situated. Prior to 1894 Nictheroy was the capital of Rio de Janeiro. The population was estimated in 1898 at 26,000.

NICUM, JOHN (1851—). An American clergyman and author, born at Winnenden, Württemberg. He studied at Muhlenberg College, Allentown, Pa., and at the Philadelphia Theological Seminary. In 1876 he became pastor at Frockville, Pa., but two years later removed to Philadelphia, where he remained two years, and then went to Syracuse, N. Y. In 1887 he took charge of the Saint John's Evangelical Lutheran Church in Rochester. His books include *History of the New York Ministerium* (1884), and *Confessional History of the Lutheran Church in the United States* (1891).

NIDIFICATION (from Lat. *nidificare*, to make a nest, from *nidus*, nest + *facere*, to make). Strictly, the act and process of nest-building. In the present article, however, the word will be broadly interpreted, so as to include the entire series of acts, instincts, and adaptations connected with the provision of a temporary breeding-home, nidus, or 'nest' for their eggs, embryos, or young, and the care of offspring, by the parents of animals generally.

A nest differs from an animal's ordinary residence in that it is not made primarily for the animal's own use, but for that of expected young. In some instances it is mainly a convenient lying-in place for the mother; in others, merely a means for the safety and comfort of eggs or helpless embryos; but often it combines these purposes and adds to them that of a nursery. The last phase is illustrated by certain social insects, some birds, a few mammals, and in human society. In the lowest ranks of invertebrate life, and to some extent among animals of comparatively high organization, the eggs, or 'spawn,' are simply voided into the water or earth and left to survive or perish, unregarded by the parent. Some animals, however, produce comparatively few eggs, protected against many dangers by being placed within one or more envelopes or 'capsules.' (See Egg.) Another widespread method is that of retaining the embryo in the maternal body until it is able to shift for itself. This is seen in many invertebrates and in some fishes. These animals are therefore known as ovoviviparous.

MATERNAL CARE OF EGGS. An advance upon this is made by a large class of creatures which carry their eggs about with them until they hatch, and in some cases even continue to care for the young, although they make no nest. Examples of this are to be found in all classes of animals, from mollusks and crustaceans up to a few of the lowest birds; and some of the brooding habits and physical adaptations thus

manifested are surprising. Thus the female argonaut (q.v.) has developed an elaborate boat-like shell in which her eggs and embryos rest secure; the violet-snail (q.v.) (*Janthina*) drags hers beneath a raft; and other instances are citable. Spiders' eggs are covered with silk, forming a bag or ball of various shapes and colors. (See SPIDER.) Crustaceans almost universally keep their eggs with them. Some insects inclose their eggs in packets and take care of them, much as do the crabs, but most insects simply deposit their eggs so that the resulting larvæ shall be within reach of suitable food, and do not know what becomes of them. It is not until the highest grades of Hymenoptera are reached—the wasps, bees, and ants—that anything which may be called a 'nest' is made in preparation for the eggs or young, or any parental care is exerted. (See ANT; BEE; WASP; INSECT, paragraph *Social Insects*.) The equal of this is hardly to be found among vertebrates until man is reached—and even then only among men in a somewhat advanced stage of culture.

FISHES AND REPTILES. Among fishes a certain amount of instinct is adapted to the best interests of the young. Thus many kinds migrate long distances to seek the water or food proper for the young, but, a suitable general surrounding having been obtained, little or no further care is taken. Only a few species build nests. Certain kinds make very crude nests, such as the hollow scooped out in the sand on some warm, clean, sunny bottom by the male sunfish, or the more elaborate structures of sticklebacks and gobies (qq.v.). Amphibians and reptiles rarely make anything which may be called a nest, but some care for their eggs in very curious ways elsewhere described.

BIRDS. The nest-making of birds is most familiar and perfect, yet it is only among the higher forms that it is manifested to any great extent. In no respect is there greater diversity among birds than in the structure of the nest. As a rule, its character is closely associated with the intelligence of the bird, modified more or less by the necessities of the situation and the structure of the bird's bill and feet. The nests of ostriches and other Ratitæ are mere accumulations of sand or earth, or cavities scraped in the ground. The nests of the lowest water-birds consist of burrows in the ground, or the eggs are laid on the bare earth or rock. Good examples are the guillemots (q.v.). The king-penguin treats its eggs in the same way. Among those a little higher in the scale, nests of sea-weed and coarse grass loosely put together make a home for the young. Most of the ducks and geese build nests of grass, and often include feathers from their own bodies, a habit carried to the extreme in the eider-duck (q.v.). Few of the wading birds build nests, the herons coming nearest to it with a platform of sticks. The grouse and quail, turkey and pheasant, all scrape together nests of leaves and grass on the ground. The allied mound-birds are remarkable for collecting great heaps of decaying vegetable matter, in which the eggs are laid, the heat caused by the decay ripening them. Doves and pigeons usually build a very frail nest of twigs, but a few species are ground breeders. Eagles, hawks, and vultures construct coarse, heavy nests of sticks and twigs on large trees or cliffs, while owls often resort to hollows in

trees, or to the deserted burrow of some mammal, especially the prairie dog. Parrots, woodpeckers, kingfishers, mouse-birds, todies, and some others lay their eggs in holes in trees, or in earthen banks, with little or no bedding. Humming-birds (q.v.) build the most delicate and beautiful nests known; and swifts extraordinary ones, consisting largely of mucilaginous saliva. (See CHIMNEY-SWIFT; SALANGANE.) Many song-birds build on the ground, where the nest is more or less cleverly concealed, but the great majority build in trees or bushes. The most remarkable nests built by any birds are those of the American orioles or hangnests, and more especially of the weaver-birds (q.v.) of Africa and the East Indies.

The perfection of many nests for the purposes to which they are put, and the ingenuity, skill, and apparently æsthetic sentiment displayed by many birds, long ago led to some study and much speculation. An excellent book was made upon the subject early in the nineteenth century—Rennie's *Architecture of Birds* (London, 1831). He divided his subjects into such classes as ground-nesters, squatters, and miners; builders of mounds, of umbrellas, of domes; masons; carpenters; platform-makers; basket-makers; weavers; tailors; felters; and cementers. This was purely artificial, but did well enough so long as nests and eggs were treated as things separate from the bird itself. About forty years later Wallace included in his book *Contributions to Natural Selection* (London, 1870) an essay on "A Theory of Birds' Nests," in which he discussed the subject from an evolutionary point of view, showing the analogy between the method of birds and primitive men in meeting their diverse requirements of shelter out of the materials most available. Wallace places birds' nests in two great classes—a functional, not a structural, classification. The first class includes those in which the eggs, young, and brooding parents are not exposed. To this group belong nests that are built in natural covers, such as holes in trees or in banks and cliffs, as well as nests covered by the bird, such as the suspended nest of the American orioles. To the second class belong the nests of the ordinary type, cup-shaped and open above, so that the eggs, young, and brooding females are exposed. This contrast in method of nidification, as he believed, correlated with the color of the female. As he says: "When both sexes are of strikingly gay and conspicuous colors the nest is of the first class, or such as to conceal the sitting birds; while, whenever the male is gay and conspicuous, and the nest is open so as to expose the sitting bird to view, the female bird is of dull or obscure colors." The comments and criticisms upon this theory by the Duke of Argyle, by Prof. A. Murray, and by J. A. Allen (*Bulletin Nuttall Ornith. Club*, vol. iii., Cambridge, 1878), and by others more recently, show that it is not so universal in its application or fully explanatory as its author considered it. The hypothesis was re-stated, with improvements, by Wallace, in *Darwinism* (New York reprint, 1889).

The more recent philosophic view, well summarized by Chapman (*Bird Life*, New York, 1898), is that, apart from and above the various considerations already mentioned, the necessity for protection of the eggs and young from physical accidents, loss of heat, and seizure by

enemies is the real motive; and the superior excellence as cradles of the nests of birds of the higher orders is explained by the fact that these orders are 'altricial'—that is, their young are born in a helpless condition, must be cared for by the parents for a considerable time, and hence both old and young need much better and safer quarters than do the 'precocial' birds, whose young (e.g. chickens) run about at birth and have no need of a nursery.

Wallace also treated of the belief formerly prevalent that birds work by instinct and never make any improvement during their lifetime in nest-building. He asserted that the chief mental faculties so exhibited by birds are the same in kind as those manifested by mankind in the formation of their dwellings; that is, essentially, imitation, and a slow and partial adaptation to new conditions. In answer to the objection that it is not so much the material as the form and structure of nests that varies, Wallace replied that such diversities may be explained in a great measure by the general habits of the species, the nature of their tools, the materials they can most easily obtain, and differences of habitat and needs that may have occurred within the period of existing species, due to changes in climate, the earth's surface, food, and so forth. Birds learn something, doubtless, in regard to the size, structure, and material of the nest of their own species before they leave it. Wallace quotes a number of cases of birds reared in the nests of other birds that sang only the song of the foster parent, learned while in the nest. Then, too, young birds do not always mate with birds of their own age, and the young bird learns nest-building from its more experienced mate. It is not unusual to see one bird of a pair, say an English sparrow, rediposing the material that the other bird has just put in place. Several observers have stated that young birds build less perfect nests than old birds, and Wallace quotes one instance in which some young chaffinches were taken to New Zealand and there set free. They built a nest in the new home which showed "very little of that neatness of fabrication for which this bird is noted in England." It is an oft-repeated observation that the nests of the Baltimore oriole, when built near the habitations of man, differ in shape and structure from those in the wilds where twine and threads are not at hand, and where there is more necessity of concealment from hawks and snakes. The swallows and swifts of all parts of the world are quick to change their nesting places from hollow trees and rocky cliffs or caverns to the porches, barns, and chimneys of men's habitations, and changes in the style of their architecture follow. The nests of house wrens and purple martins vary with the situations chosen. The orchard oriole may build a shallow nest in stout branches or deep ones in swaying willows. Many similar instances of change in form and material might be adduced. "Children and savages imitate before they originate; birds, as well as all other animals, do the same," so when the environment remains constant, the form and constructive material of birds' nests vary little.

BROODING OF BIRDS. The eggs of birds are hatched by the steady application of warmth for a sufficient time to mature the embryo to the stage when it breaks from the shell. This

PENSILE NESTS OF BIRDS

1. AUSTRALIAN FLOWER-PECKER (*Dicaeum hirundinaceum*).
2. EUROPEAN PENDULINE TITMOUSE (*Aegithalus pendulinus*).
3. BRAZILIAN CRESTED CACIQUE (*Ostinops citrlus*).

4. INDIAN TAILOR BIRD (*Orthotomus aitorius*).
5. RED-EYED VIREO (*Vireo olivaceus*).
6. BALTIMORE ORIOLE (*Icterus galbula*).

necessary warmth (about 105° F.) is secured by the bird covering the eggs with its body, 'sitting' upon or 'incubating' them almost continuously for a length of time which in a general way is proportioned to the bird's size. No very extended and accurate observations on this point have been recorded; the best are those by Evans in *The Ibis* (London) for 1891 and 1892. Broadly speaking, most of the small song-birds hatch their young in from 13 to 15 days, but the very smallest may take less time—the humming-bird, it is said, only 10 days. In canaries, it is from 15 to 18 days; in the common fowl, it is 21 days; in the duck, it is from 28 to 30 days; in the guinea-fowl, it is 28 or 29 days; in the turkey, 30 days; and in the swan, from 40 to 45 days. The emeu is said to sit 50 days. Small altricial birds usually begin sitting after the first egg is laid; but game-birds and water-fowl rarely begin to sit until the whole clutch is in the nest, so that the whole brood shall hatch simultaneously.

It is in most birds the function of the female to perform the duties of incubation, during which she is to a greater or less extent defended, fed, and cheered by her mate. Twice or oftener each day she leaves the nest for rest and to get food, and the male takes her place for an hour or two. It sometimes happens that if she is killed, the male concludes the process of incubation and cares for the young. In some groups he does the entire duty of sitting. This seems to be universally true of the ostrich and other ratite birds, and is the practice of the godwits, phalaropes, and certain other shore-birds. Both sexes join in the care of the young at first, but in most cases their education is gradually left entirely to the mother.

NESTS OF MAMMALS. Among the mammals, a 'nest' in the present sense of the word is not common. The female, when about to bring forth young, is either already in a den or lair which has been a family residence during the winter or is permanently so, or else requires no more accommodation than a retired corner in the midst of a thicket or beneath a sheltering rock. Squirrels, wood-rats, and mice (qq.v.), however, often construct in bushes and trees, or among tall grass or low brush, globular nests of leafy twigs or of grass in which the young are born. The 'lodges' of the beaver, muskrat, coypu, and the like, elsewhere described, are family houses in which the protection of the young is probably the prime desideratum. Hardly different, and by no means so elaborate, are the platforms or 'nests' of the anthropoid apes, and especially of the orangs (see ORANG-UTAN), where the young are born, but in which they do not long remain. There is, however, little to choose between these structures, or their advantage to the young, and those of many nomadic savages, such as the aboriginal Bushmen of South Africa, the northern Australians, or the Indians of the Utah Basin and deserts of Arizona and Chihuahua.

Consult standard works on zoölogy, especially *Cambridge Natural History*, vols. iii.-x. (London, 1898-1902); and Newton, article "Nidification," in *Dictionary of Birds* (London and New York, 1893-96). See also works cited under Egg.

NIEBUHR, né'boor, BARTHOLOMÆUS GEORG (1776-1831). A German historian, critic, and philologist, born August 27, 1776, at Copenhagen,

where his father, Carsten Niebuhr, then resided. He showed singular aptitude for learning in his earliest youth, and his powers of acquiring knowledge kept pace with his advancing years. After preliminary education, under the superintendence of his father, he studied law and philosophy at Kiel, and then went to Edinburgh, where he devoted himself more especially to the natural sciences. On his return to Denmark he became private secretary to the Finance Minister, Schimmelmann, and from that period held several appointments under the Danish Government, being made director of the Government bank in 1804. He entered the Prussian civil service in 1806, and during the three succeeding years he shared in the vicissitudes which befell the Government of his chief, Count Hardenberg. The opening of the University of Berlin in 1810 opened a new era in the life of Niebuhr. He resigned his Government position and gave at the university a course of lectures on Roman history, which, by making known the results of the new critical methods which he had applied to the elucidation of obscure historical evidence, established his position as a leader in the scientific study of history, and effected an important change in historical method. In 1813 he reentered the Government service. Appointed in 1816 Prussian Ambassador at the Papal Court, Niebuhr was enabled to verify many of his conjectures and test his methods by the actual sources of ancient Roman history. On his return from Rome in 1823, Niebuhr took up his residence at Bonn, where he delivered classical and archaeological lectures and expositions. The Revolution of 1830 again stirred his interest in public affairs. He died January 2, 1831. Niebuhr's scholarship was broad, vigorous, and independent. He was an accomplished linguist and a philosophical and scientific thinker. He was a path-breaker in the modern method of historical criticism, and while all his conclusions are not accepted to-day, he showed the way by which they might be tested in the light of more complete knowledge. He was the founder of the *Rheinisches Museum* at Bonn. Among his important works are: *Römische Geschichte* (3 vols., Berlin, 1811-32; new ed. 1873; the first two volumes translated by Hare and Thirlwall, and the third by Smith and Schmitz); *Griechische Heroengeschichte* (1842; 11th ed. 1896), written for his son Marcus; *Geschichte des Zeitalters der Revolution* (1845). The *Kleine historische und philologische Schriften* (1828-43) contains his introductory lectures on Roman history, and many of the essays which had appeared in the transactions of the Berlin Academy. Besides these, and numerous other essays on philological, historical, and archaeological questions, Niebuhr coöperated with Bekker and other learned annotators in editing the *Scriptores Historiæ Byzantinæ*; he also discovered hitherto unprinted fragments of classical authors, as, for instance, Cicero's *Orations*, and portions of Gaius; published the *Inscriptiones Nubienses* (Rome, 1821); and was a constant contributor to the literary journals of Germany. His *Lectures on Ancient History* is familiar in English translation. Consult: Winkworth, *Life and Letters of Niebuhr* (London, 1852); Lieber, "Reminiscences of an Intercourse with Niebuhr," in *Miscellaneous Writings* (Philadelphia, 1884); and for his biography, Classen (Gotha, 1876) and Eysenhardt (ib., 1886).

NIEBUHR, CARSTEN (1733-1815). A German traveler, father of the preceding, born at Lüdningworth in Hanover, where his father was a small farmer. He entered the University of Göttingen, and in 1760 became a lieutenant of engineers in the Danish army. The next year he sailed with the expedition sent out by Frederick V. of Denmark to explore Egypt, Arabia, and Syria. His companions, the best known of whom was the naturalist Forskål (q.v.), all died of hardship or disease, but Niebuhr continued alone and only after six years of wandering did he return to Europe. The results of his observations appeared in *Beschreibung von Arabien* (1772); *Reisebeschreibung von Arabien und andern umliegenden Ländern* (1774-78); and *Reisen durch Syrien und Palästina* (1837). He also brought out the results of Forskål's work under the titles *Descriptiones Animalium* (1775), *Flora Egyptiaco-Arabica* (1776), and *Icones Rerum Naturalium* (1775-76); and contributed a number of papers to the German periodical *Deutsches Museum*. The accurate observation and the unswerving truthfulness of their author place these works among the most reliable books on the lands which they describe. In 1778 Niebuhr entered the civil service and removed from Copenhagen to Meldorf, in Holstein, where he died. Consult *Carsten Niebuhrs Leben* (1816), by his son, Barthold Georg Niebuhr, an English version of which, by Mrs. Sarah Taylor Austin, was published in the *Lives of Eminent Persons* (London, 1833).

NIECKS, néks, FREDERICK (1845—). A British musician, critic, and writer, of German birth and parentage. He was born in Düsseldorf, and studied under native teachers. When twenty-three years of age he moved to England, and became organist at Dumfries, and played viola in A. C. Mackenzie's string quartet. He subsequently became critic for the *Monthly Musical Record* and Novello's *Musical Times*. He was appointed professor of music in Edinburgh University, and was considered one of the highest musical authorities in Great Britain. His works include: *Dictionary of Musical Terms* (1884); *Frederick Chopin as a Man and Musician* (1888).

NIEDERMEYER, nê'dêr-mî'êr, LOUIS (1802-61). A Franco-Swiss composer, born at Nyon, Switzerland. He studied under Moscheles and other eminent masters at Vienna and Rome. His first opera was produced at Naples, but of several composed by him, *Stradella* (1837) was the only one which had success. He also set to music a number of songs by Victor Hugo, Lamartine, and Manzoni. Dissatisfied with the meagre success of his secular work, he turned to church music and achieved real success. The Ecole Niedermeyer, founded by him, subsequently came under Government subvention, and equally favorable results attended his journal *La Muttrise*, which became a very influential musical factor. He died in Paris, and a bust of him has been placed in the foyer of the Grand Opéra.

NIEDERWALD, nê'dêr-vâlt. The finely wooded western spur of the Taunus, in the Prussian District of Wiesbaden, near the Rhine. Its height is 1115 feet. On it, opposite Bingen, stands the national monument commemorating the war of 1870-71 with France. The pedestal, 82 feet in height, is richly decorated with reliefs and allegorical figures. On it stands a

bronze figure of Germania, 34 feet high, holding the Imperial crown, typifying the formation of the Empire. The monument is the work of Schilling of Dresden. It was unveiled on September 28, 1883, when an anarchistic plan for dynamite explosion was frustrated by the damp weather. The two ringleaders of the attempt were executed in 1885. Two railways lead to the monument from Rüdesheim and Assmannshausen, famous for their wines.

NIEDNER, nêt'nêr, CHRISTIAN WILHELM (1797-1865). A German ecclesiastical historian. He was born at Oberwinkel, near Waldenburg; studied theology at Leipzig; and was professor there (1829-49) and afterwards at Berlin (1859-65). His *Geschichte der christlichen Kirche* (2d ed. 1886) shows a remarkably minute acquaintance with materials, but is composed in a peculiarly abstract and difficult style. For the last twenty years of his life, Niedner was an editor of the *Zeitschrift für die historische Theologie*.

NIEHAUS, nê'hous, CHARLES HENRY (1855—). An American sculptor, born in Cincinnati, Ohio. He studied at the McMicken School of Design there, and in Munich, where his "Fleeting Time" won the first medal ever awarded to an American. He returned to America in 1881, and two years afterwards made statues of Garfield for Cincinnati, and of William Allen for the Capitol in Washington. Both these works are massive and dignified, and are fine portraits. From 1881 until 1843 he was in Rome, and upon his return to America he settled in New York City. His other works include: the Lee monument at Richmond (1886); "The Scraper" (1893); the statues of Hooker and Davenport, in the Connecticut State Capitol; and the bronze doors for Trinity Church, New York City, given in memory of John Jacob Astor. The six reliefs of religious and historical subjects which decorate these doors are fine examples of delicate and skilled workmanship. The colossal statues of Gibbon and Moses, for the Congressional Library in Washington, are also works notable for strength and simplicity. He was awarded first prize in the competition for the memorial to Samuel Hahneman, in Washington, D. C. Other works that should be mentioned are the pediment of the Appellate Court building, New York City, and two large groups representing Mineral Wealth at the Pan-American Exposition of 1901.

NIEL, nê'el', ADOLPHE (1802-69). A French marshal. He was born at Muret, Haute-Garonne, and educated at the Ecole Polytechnique and at the military academy of Metz. He became lieutenant of engineers in 1827, captain in 1835, and served in Algeria in 1836-37, gaining the rank of *chef-de-bataillon* by his courage. He commanded the engineers in the army of Oudinot, which put an end to the Roman Republic in 1849, and became brigadier-general and director of the engineer department in the Ministry of War. As general of division he conducted the operations which destroyed the Russian fortress of Bomarsund in August, 1854. At the head of the engineers in the Crimea, he directed the siege operations around Sebastopol. During the Italian War of 1859 his services at Magenta and Solferino made him marshal. In 1867 he became Minister of War.

NIELLO (It., blackish). A black substance capable of being ground fine and also of being

melted by a moderate heat. The ingredients are essentially silver and sulphur, but other metals are melted with the silver before the sulphur is added. It is used as enamel is used, to fill up incised lines and patterns, the metal background being nearly always silver. Thus the top and sides of a silver box may be engraved with elaborate ornaments in scrolls, conventional flowers, and the like; the separate parts are heated, the powdered niello is spread over the whole surface, and as it melts, fills every incision, even the finest lines and points. The metal is then cleaned and polished, so that the smooth surface shows a black pattern on a plain silver ground. In some modern work the black pattern is slightly in relief; this suggests the application of the ground and nearly fused niello by hand to the actual lines of the pattern.

The art of working in niello dates from antiquity. It was in common use under the Byzantine Empire, and this tradition has been inherited by the modern Russians, together with so many other forms of decorative art. It was also practiced in Western Europe throughout the Middle Ages, though it was less popular than enamel. A great deal of altar plate and similar decorative objects belonging to the Christian ritual were adorned by niello. The metal-workers of India have always employed the art with high success. Consult: Ottley, *History of Engraving* (London, 1816); Duchesne, *Essai sur les nielles gravures des orfèvres florentins du XVème siècle* (Paris, 1826); Waterton, "On Niello," in *Archæological Journal*, vol. xix. (London, 1862); Passavant, *Le peintre-graveur* (Leipzig, 1860-64); Labarte, *Arts of the Middle Ages* (2d ed., Paris, 1872-75); Davenport, "Niello Work," in *Journal of the Society of Arts*, vol. xlviii. (London, 1901).

NIEM, nê'm, or **NIEHEIM**, nê'him, DRETRICH OF (1340?-1418). A German chronicler, born in the town of Nieheim, in the mediæval Bishopric of Paderborn. He received office under the Papal Curia at Avignon, and went with it to Rome in 1376. In 1395 he was made Bishop of Verden (Hanover) by Boniface IX. He appears to have been forced from this dignity by disputes, and in 1403 is met with as *abbreviator* in the Papal Chancellery. During the subsequent discussions which harassed the Church, he insisted on internal reforms. He wrote in this connection his three books, *De Schismate* (completed in 1410; printed in 1532, and subsequently), a vivid history of the events of the years 1376-1410. This with others of his works, such as the *Historia de Vita Joannis XXIII.* (1682), and the *Nemus Unionis* (incorporated with the Basel 1566 edition of the *De Schismate*), forms an important source for historical investigation. Consult the *Life* by Sauerland (Göttingen, 1875).

NIEMANN, nê'män, ALBERT (1831-). A German dramatic singer, born at Erxleben. He was at first a singer in the chorus at Dessau. After a thorough training under Schneider and Nusch, his voice (tenor) attracted the attention of the King of Hanover, who took him into his service. Wagner selected him to sing in *Tannhäuser* on its first production in Paris in 1861. He sang in the United States, and was remarkable for his ability in the dual rôle of vocalist and actor. He retired from the stage in 1889.

VOL. XIV.—36.

NIEMBSCH VON STREHLENAU, nêmah fôn strâ'le-nou, NIKOLAUS. See LENAÜ, NIKOLAUS.

NIEMCEWICZ, nyêm-tsâ'vich, JULIAN URSYN (1757-1841). A Polish author and statesman, born at Skoki, Lithuania. After graduating from a military school he entered the army at twenty as an adjutant and became major in 1788, when he was sent as Deputy to the Polish Diet. With a colleague he published the *People's Paper*, and was the framer of the so-called 'Constitution of the 3d of May,' making monarchy hereditary in Poland (1791). He was Kosciuszko's adviser and aide, and was severely wounded at Maciejowice and taken prisoner with his chief (1794). While in the fortress of Saints Peter and Paul in Saint Petersburg, he translated Pope's *Rape of the Lock* and Gray's *Elegy*. Released by Paul after two years, he came with Kosciuszko to the United States, where he married Mrs. Livingston Kean of New York. On the report of Napoleon's entrance into Poland, he left America for his fatherland in 1807. The King of Saxony appointed him secretary of the Senate in the new Duchy of Warsaw, as well as inspector of schools and member of the Supreme Council of Public Instruction. When Poland came under Russia's control, he was retained in office by Alexander I., but he did not lose faith in the restoration of Poland, and took a most active part in the events of 1830, after which he went into exile. He died in Paris. His *Historical Ballads* (1816-19) which aroused the national consciousness of the Poles, have retained much of their hold on the public, and his *Meditations at Ursynow* are his best lyric poems. *The Envoy's Return*, among his dramatic works, and his novel of manners, *Johann of Tenczyn*, enjoyed a great vogue. The *History of Sigismund III.'s Reign* (latest ed. 3 vols., Breslau, 1836) and a *Collection of Memoirs on Ancient Poland* are valuable for the material collected. A collection of his works was published in Leipzig (1838-40), but it is incomplete. Consult a biography in Polish, by A. Czartoryski (Berlin, 1860).

NIEMEN, nê'men, *Pol. pron.* nyêm'ên. A river of Russia and Prussia (Map: Russia, B 3). It rises near the city of Minsk, and flows westward to Grodno, where it becomes navigable. Thence it flows northward, forming the boundary between West Russia and Poland; turning again westward at Kovno, it enters East Prussia, where it takes the name of Memel, and empties into the Kurisches Haff through a large compound delta beginning near the city of Tilsit. Its total length is 490 miles. It is of considerable commercial importance, being the outlet for large quantities of timber and grain from Russia. Its navigation is extended through several canal systems. Its banks are mostly low and often marshy, and in the delta they are protected from inundations by large dikes.

NIEMEYER, nê'mi-er, AUGUST HERMANN (1754-1828). A German educator and theologian. He was born at Halle, and after finishing his studies was appointed professor of theology in the university (1779). In 1807 Niemeyer was carried to France a prisoner of war. A year afterwards, on his return, he became rector of the University of Halle, and its chancellor. As a theologian, he held to a moderate rationalism;

but even his theological works were tinged with the views of an educator, and in the latter character he did his most important work. Among Niemeyer's works, the chief are: *Charakteristik der Bibel* (1775-82); *Handbuch für christliche Religionslehrer* (1805-07); and *Leitfaden der Pädagogik und Didaktik* (1802).

NIEMEYER, FELIX VON (1820-71). A German physician. He was born at Magdeburg, where he practiced medicine after studying at Halle, Prague, and Vienna. At the time of the cholera epidemic of 1848-49 he published *Die symptomatische Behandlung der Cholera mit besonderer Rücksicht auf die Bedeutung des Darmleidens*. In 1853 he became head of the medical department of the city hospital at Magdeburg, and two years afterwards was appointed professor at Greifswald, whence in 1860 he went to Tübingen. Niemeyer's great work, *Lehrbuch der speziellen Pathologie und Therapie* (1858 sqq.; 11th ed. 1884), met with immediate success and proved one of the most important medical works of the century.

NIEPCE, né'ps', JOSEPH NICÉPHORE (1765-1833). A French scientist, born at Chalon-sur-Saône. He entered the Revolutionary army in 1789, but two years later was compelled to resign because of ill health, and in 1795 became civil administrator of the District of Nice. In 1801 he returned to his native town and thenceforth devoted himself to the study of chemistry and mechanics. During the following years he made a number of inventions, and in 1813 turned his attention to the production of pictures upon metal plates by means of light. In 1824 he discovered a process by which he could fix the images of the camera obscura. Two years later he entered into relations with Daguerre, and in 1829 the two formed a partnership to "coöperate in perfecting the discovery invented by M. Niepce and perfected by M. Daguerre." Article V. of their agreement says that Niepce gave "his invention" and Daguerre "a new contrivance of the dark chamber, his talents, and his education;" so that if the title "inventor of photography" can be applied to any one man it seems that it should go to Niepce. He died at Gräs, near his birthplace, poor and comparatively unknown. He wrote *Notice sur l'héliographie* (1829). Consult: Ernouf, *Les inventeurs du gaz et de la photographie* (Paris, 1877); and Fouqué, *La vérité sur l'invention de la photographie: Nicéphore Niepce* (ib., 1867).

NIEPCE DE SAINT VICTOR, de sãn vèk'tôr', CLAUDE MARIE FRANÇOIS (1805-70). A French photographer, born at Saint-Cyr, near Chalon-sur-Saône. He served in the army, and was appointed in 1854 second commandant of the Louvre. The discoveries in photography made by his uncle, Nicéphore Niepce, jointly with Daguerre, had attracted his attention to that art, and he succeeded in bringing out himself a number of interesting inventions. He was the first to use albumen for photographic purposes, and was one of the first to try photography on glass and to produce steel-engravings by a photographic process. He also succeeded in obtaining colored images, which he named *heliocromes*; the colors, however, were fugitive. In 1855 he published the various memoirs in which he had at different times communicated his discoveries to the Academy of Sciences, under the title of

Recherches photographiques, which was followed in 1856 by *Traité pratique de gravure sur acier et sur verre*.

NIESE, nê'ze, BENEDICTUS (1849—). A German classical philologist and historian. He was born at Burg, on the island of Fehmarn, in Schleswig-Holstein, and in 1877 he became professor in the University of Marburg. His publications include: *Flavii Josephi Opera I.-VII.* (Berlin, 1885-95); *Grundriss der römischen Geschichte* (2d ed., Munich, 1897); *Geschichte der griechischen und makedonischen Staaten* (Gotha, 1893-99); *Flavii Josephi Antiquitatum Epitoma* (Berlin, 1896); *Kritik der beiden Makkabäerbücher* (ib., 1900).

NIETZSCHE, nê't'she, FRIEDRICH (1844-1900). A German philosophic writer, one of the most daring thinkers and charming stylists of the nineteenth century. He was born at Röcken, near Leipzig, son of a Protestant pastor of the village, who died when the precocious boy was five years old. He was brought up by his mother at Naumburg on the Saale; studied at the noted State school at Pforta, and then devoted himself to the study of the classics in the universities of Bonn and Leipzig. At twenty-five, on the recommendation of Ritschl, he became professor extraordinarius of classical philology at Basel, and shortly afterwards was promoted to be professor ordinarius there—a post which he was forced to resign in 1879 because of an affection of his eyes. Meanwhile Nietzsche had made the acquaintance of Wagner and become an ardent advocate of Schopenhauer's theories of art. During this period, which was brief and immature, the only work of importance he wrote was *Geburt der Tragödie aus dem Geiste der Musik* (1872), in which he maintained that both Dionysiac (orgiastic) and Apollonic (temperate) motifs contributed to the origination of Attic tragedy. The book might be termed a defense of Wagner's programme. But shortly thereafter came a breach between Nietzsche and Wagner, said to be due to Wagner's compromises with success. With the loss of faith in Wagner, he lost faith in God and in Christianity, in traditional morality, and in current human ideals, and ended by deifying passion and despising reason. He went so far as to say that the untruth of a view is not a valid objection to it if only it be useful, and that the falsest views are often the most useful. Satisfaction of instincts became his ideal; we must, he maintained, at all hazards realize the will to dominate (*der Wille zur Macht*). The moral man who lives for others is a weakening, a degenerate. The lordly egoist who exploits other men and rises on stepping stones of their dead selves to higher things is the proper human ideal, the over-man (*Ueberschensch*). The evolution of Nietzsche's thought, which culminated in this idealization of the inhumane victor in the struggle for existence, can be traced in his *Menschliches, Allzumenschliches, ein Buch für freie Geister* (1876-80); *Morgenröthe, Gedanken über moralische Vorurtheile* (1881); *Also sprach Zarathustra* (1883-84); *Jenseits von Gut und Böse* (1886); *Zur Genealogie der Moral* (1887); *Der Fall Wagner* (1888); and *Götzendämmerung* (1889). Among his other works should be mentioned *Der Wille zur Macht: Versuch einer Umwertung aller Werte* (1896). Of this book the first part is entitled *Der Antichrist*, where

the author traces the history of the world, showing the part played by tawny brutes and tawny heroes in the great struggle for power, and representing might as right, a right overthrown by the slavish and false concepts of the Jewish Nazarene. After Nietzsche left Basel he lived for several years in Turin; in 1889 it became evident that his brain was affected, partly due to hereditary causes and partly to the abuse of soporifics. He retired to his mother's home near Weimar, where he was cared for by his sister until his death. As can be seen from the above sketch of the course of his philosophical development, Nietzsche accepted the struggle for existence as an ultimate fact which man ought not to attempt to ameliorate. It is only the slavish spirit which attempts to modify the inevitable natural process of the elimination of the unfit. This attempt to stem the tide of natural evolution results in the servile morality (*Sklavenmoral*) characteristic of the present day. Nature's morality is the morality of the ruthlessly strong hero (*Herrenmoral*). This view is the inevitable outcome of an uncritical acceptance of the merely physical 'is' as the moral 'ought.' Its philosophical significance lies in its exhibiting in undisguised form the logical consequences, for a Darwinian, of the principle that whatever is, is right. His popularity is due partly to this hyper-Darwinianism, but more largely, since such a doctrine is against the predominant spirit of humanity of the present age, to his fascinating literary style. He is a great prose poet, and if we may judge from a volume of early verse, *Gedichte und Sprüche* (1897), in tone a revolt against the lyric tradition of Heine, he might have been a great lyricist. Richard Strauss (q.v.) has founded one of his most famous tone-poems upon *Also sprach Zarathustra*. A complete edition of his works was begun at Leipzig in 1895; an English version under the editorship of Tille is incomplete. Consult the biography by his sister, Frau Förster-Nietzsche (Leipzig, 1895, sqq.), and appreciation in Riehl, *Friedrich Nietzsche, der Künstler und der Denker* (Stuttgart, 3d ed., 1901); also Seth, *Man's Place in the Cosmos* (2d ed., Edinburgh, 1902); Wallace, *Lectures and Essays in Natural Theology and Ethics* (Oxford, 1898); Dolson, *The Philosophy of Friedrich Nietzsche* (New York, 1901), with an excellent bibliography; Brandes, *Friedrich Nietzsche* (Frankfort, 1888); Kronenberg, *Nietzsche und seine Herrenmoral* (Munich, 1901); Eisler, *Nietzsches Erkenntnistheorie und Metaphysik* (Leipzig, 1902).

NIEUWENHUIS, né'ven-hois, DOMELA (1846—). A Dutch Socialist, son of Domela Nieuwenhuis (1808-69), who was a prominent Lutheran theologian. The son, born at Amsterdam, studied theology, was for nine years preacher at the Lutheran Church in The Hague, and then became a leader of the Social Democrats and practically the founder of the party in Holland. In 1887 he entered the States-General, but he failed of reelection in 1888. His views became more and more extreme, and he broke from the State Socialists to form with Cornelissen a free Socialist faction. Nieuwenhuis was prominent in the Socialist Congresses of Brussels (1891) and of Zurich (1893) as an opponent of Liebknecht and his motion against war and compulsory military service. In 1897, when

Recht voor allen became the property of the centralization Socialists, Nieuwenhuis started a new journal, *De vrye Socialist*.

NIEVO, né-à'vò, IPPOLITO (1832-61). An Italian novelist and poet, born at Padua. He studied in his native town, took part in the revolutionary disturbances of the time, and finally joined Garibaldi. His *Confessioni di un ottuagenario* (1867) holds a high place among the historical novels of the century. He also wrote *Il conte pecorajo* (1857), *Angelo di bontà* (1858), and *Poesie* (1883).

NIEVRE, nyà'vr'. A central department of France, nearly continuous with the former Province of Nivernais. It is named from the river Nièvre, an affluent of the Loire. It has the Loire and the Allier as its western boundary (Map: France, K 4). Its area is 2658 square miles. The eastern half is occupied by the forest-covered Morvan Mountains, and the soil is generally rocky and sandy. Forest and mineral products, the latter including coal, iron, marble, and mill-stones, form the chief wealth of the department, but stock-raising and viticulture are also important. The chief manufactures are glass and porcelain, and there are large iron and steel works. Population, in 1891, 343,581; in 1901, 323,783. The capital is Nevers (q.v.).

NIFLHEIM, nif'l-him (Icel., cloud-home). One of the nine separate abodes or homes of which the old Scandinavians conceived the world as consisting in the beginning of time. It is the kingdom of cold and darkness, and is separated from Muspelheim, the kingdom of light and heat, by a huge chasm (Ginnungagap, yawning gap).

NIFO, nè'fò, AGOSTINO, or AUGUSTINUS NIPHUS (c.1473-c.1538). An Italian scholar, born in the Province of Calabria. At an early age he settled at Sezza, and afterwards studied and taught philosophy at Padua, Salerno, Naples, Rome, and Pisa. Nifo at first belonged to the school of Averroës (q.v.). His commentaries, several times reprinted, were collected with his *Opuscula Moralia et Politica* in 14 volumes (Paris, 1654). Afterwards, Nifo modified his beliefs to suit orthodox doctrine, and published the writings of his master (1495-97), with notes and objections. He was charged by Leo X. to answer Pompanazzi's *De Immortalitate Animi*, and for this service he received the title of Count Palatine. His philosophical treatises, *De Immortalitate Animi* (1518 and 1524), *De Intellectu Libri VI.* (1503, 1527, 1592), and *De Infinitate Primi Motoris Quæstio* (1504), are the most important of his productions.

NIGEL, nîg'el, known as NIGEL WIREKER (fl. c. 1190). A satirist who flourished toward the close of the twelfth century. He was a monk in Christ Church priory, Canterbury, and was personally acquainted with Thomas a Becket. His famous work is *Speculum Stultorum* (A Mirror of Fools), a satire in Latin elegiac verse on the clergy and society in general. The hero is Burnellus, or Brunellus, an ass, who wants a longer tail. The poem was immensely popular for centuries. Under the title, "Daun Burnel the Asse," it is quoted by Chaucer in the "Nun's Priest's Tale." Nigel also wrote several short Latin poems and a prose treatise, *Contra Curiales et Officiales Clericos*. Consult: Wright, *The Anglo-Latin Satirical Poets* (London, 1874);

and Ward, *Catalogue of Romances* (London, 1883-93).

NIGEL/LA (Neo-Lat., fem. of Lat. *nigellus*, blackish, diminutive of *niger*, black). A genus of annual plants of the natural order Ranunculaceæ, indigenous to the Mediterranean region and the warmer temperate parts of Asia, having five colored spreading sepals, five or ten small two-lipped petals, with tubular claws; carpels more or less connected, many-seeded; leaves divided into threadlike segments, and flowers solitary at the top of the stem or branches. *Nigella damascena*, occasionally seen in gardens, is known by the names fennel flower, devil-in-a-bush, and devil-in-a-mist. The somewhat peppery aromatic seeds have been used as a substitute for spices. Those of *Nigella sativa*, nutmeg flower, a species common in grain fields in the south of Europe, are supposed to be the black cummin of the ancients, and perhaps the cummin of the Bible. The seeds of a species of *Nigella* are much used by the Afghans for flavoring curries.

NIGER, nî'jër, or JOL'IBA. The third largest river of Africa (Map: Africa, D 3). It has no single native name. It is generally known, however, as the Joliba in the upper course, the Issa and Mayo in the middle, and the Kwara (Quorra) in the lower course. The Niger rises on the inner frontiers of Sierra Leone and Liberia, and flows first northeastward to Timbuktu; thence eastward along the escarpment of the Sahara Plateau; finally it turns to the southeast, which direction it maintains, with a few deviations, to its mouth. It enters the Gulf of Guinea through a vast delta extending 100 miles inland, and occupying an area of 14,000 square miles. The delta consists almost wholly of low and malarious mangrove swamps, and its size is increasing rapidly, owing to the constant inland breezes which prevent the sediment from being carried to sea. Only one of the numerous arms of the delta, the Nun, is accessible to sea-going vessels. The length of the Niger is about 2600 miles, and the incline of its bed through its whole course is very gentle, with few rapids, in which respect the Niger differs conspicuously from other African rivers. It is, however, navigable only in sections, being obstructed at several places. At Bamaku, 250 miles from its source, it is already 500 yards wide, and from here it is navigable for small steamers to Timbuktu, above which place it spreads out into a large inland delta converging in the marshy Lake Debo. Below Timbuktu it runs through a rocky gorge, where it is narrowed to a width of 300 feet, and obstructed by rapids. The greater part of its middle course lies in a desert region, where it receives scarcely any tributaries, and where vegetation flourishes only immediately along its banks. As it flows southward, however, the country becomes more and more fertile and populous. The head of permanent steam navigation is at Rabba, 460 miles from the mouth of the river, which below that point is a broad and tranquil stream 50 feet deep in the dry season, and over 100 feet deep during floods. Some distance below Rabba the Niger receives its largest tributary, the Benue (q.v.)

The chief towns or settlements on the river are, in descending order, Bamaku, Sego-Sikaro, Sansanding, Gundam, Timbuktu, Gogo, Birni,

Say, Busah, Rabba, Lakoja, and places situated in the delta.

The name Niger (*Nigris*) is mentioned by ancient writers, but did not probably refer to this river. The stream was first made known to Arabian geographers in the Middle Ages by travelers across the Sahara, but it was then believed to communicate with the Nile. It had not been seen by Europeans until Mungo Park explored its upper course in 1796. The lower course was first explored by Clapperton, Denham, and Lander in 1825-32. Consult: Baikie, *Reports on the Geographical Position of the Countries in the Neighborhood of the Niger* (London, 1863); Rohlf, *Quer durch Afrika* (Leipzig, 1874); Thomson, *Mungo Park and the Niger* (London, 1890); Möckler-Ferryman, *Up the Niger* (ib., 1892); Trotter, *The Niger Sources and the Borders of the New Sierra Leone Protectorate* (ib., 1898); Hourst, *The Exploration of the Niger*, trans. (ib., 1898); Vandeleur, *Campaigning on the Upper Nile and Niger* (ib., 1898).

NIGERIA, or NIGER TERRITORIES. A British colonial possession in Africa, organized in 1900. It occupies the territory between the Military Territories of French Sudan, Lake Chad, the German possession of Kamerun, the Gulf of Guinea, the British colony of Lagos, and the French possession of Dahomey (Map: Africa, E 4). It is divided into Northern and Southern Nigeria. Northern Nigeria comprises a large portion of the Fulah or Sokoto Empire, with its subordinate States of Nupe, Ilorin, Muri, Gandu, Kano, Katsena, Banchi, a portion of Adamawa, Bakundi, Donga, Takum, and Zaria, besides a part of the Kingdom of Bornu, and of the pagan confederation of Borgu. Southern Nigeria consists of what was formerly known as the Niger Coast Protectorate, supplemented by the Protectorate of Lagos and considerable acquisitions along the Cross River in the southeast. No trustworthy figures for the area of the region and for the population are available. Current estimates of the area range from 400,000 to 500,000 square miles; of the population, from 25,000,000 to 40,000,000.

The physical features of the region are as yet slightly known. The country along the gulf is, as far as 40 miles inland, swampy, and intersected by the numerous arms of the Niger and a multitude of other streams interlacing each other and lined with mangrove trees. The climate of that district is characterized by humidity and unhealthfulness. The portion north of the coast region, as far as the confluence of the Benue with the Niger, is an undulating forest country, while that north of the Niger is mostly hilly and partly covered with thin forests. The extreme north partakes of the character of the Sahara. The climate of the interior appears to be more healthful.

Agriculture is pursued mostly along the Benue River and in the plains of the interior. Cotton and many cereals are raised to some extent, but the chief articles of food among the natives are bananas and yams. The oil tree is found in abundance and the forest region is full of rubber trees and valuable woods. In its present state of development the country produces chiefly palm oil and kernels for export. Some ivory, indigo, and rubber are also brought to the southern ports from the interior. The principal means of communication are the Niger, the

Benue, and a number of smaller rivers. The principal seaports are Akassa, Old and New Calabar, and New Benin. The imports and exports for 1900-01 amounted to \$5,842,490 and \$5,679,135 respectively.

At the head of the administration of Nigeria are two high commissioners, assisted by residents. There are a supreme court, at Asaba, and a number of resident courts. The revenue is derived principally from customs duties, which are collected at the ports of Lagos and Southern Nigeria, and distributed among these two governments and that of Northern Nigeria. In 1900-01 the revenue and expenditure amounted to \$1,855,392 and \$1,481,176 respectively. The control of the British Government thus far extends only to a small proportion of the territory along the coast. The prerogatives of the Sultan of Sokoto are still recognized in a large measure.

The inhabitants of the coast region are pure negroes in a very low state of civilization. The inhabitants of the interior are also of negro descent, intermixed with some of the races of Northern Africa. They show some traces of Moorish influence. The religion is Mohammedanism tinged with fetishism. The most advanced and intelligent of the population are the Hausas. (See HAUSA STATES.)

British settlements and trading stations were established along the Gulf of Guinea in the region of the Niger at a very early period, but these were only private enterprises without any political powers or aims. It was only with the establishment of the United African Company, reorganized into the National African Company by Sir George Goldie in 1882, that the movement looking toward the future acquisition of Nigeria by Great Britain was started. After having concluded political treaties with the native rulers the company obtained a royal charter in 1886, and its name was changed to the Royal Niger Company. The boundaries were fixed by treaties with Germany in 1885, 1886, and 1893, and with France in 1889, 1890, and 1898.

In 1884 and 1887 the territory of Nigeria was declared a British protectorate, and the seaboard region was organized into the Oil Rivers Protectorate, and was put under the authority of a royal commissioner in 1891, the company having no jurisdiction in that part of the country. The name of the Oil River Protectorate was soon changed to Niger Coast Protectorate, and its territory was augmented by the addition of the Kingdom of Benin in 1897, and further extensions along the Cross River in the south-east. On January 1, 1900, the company surrendered its charter and the whole territory passed under the British control.

NIGGER CHUB, or **NIGGER DRCK**. A chub (*Exoglossum maxillingua*) of the lakes and

rivers of the Middle States, distinguishable from all other cyprinids by its three-lobed under jaw. It is about six inches long, dusky greenish on the back, with a black bar behind the gill-cover. Compare CUTLIPS (a name also locally given to the present fish).

NIGGER-FISH. One of the many names given to the sea-bass of the genus *Bodianus*, allied to the groupers. They are small, brightly-colored spotted fishes that live in warm seas. A common species about Bermuda, Florida, and

NIGGER-FISH (*Bodianus fulvus*).

southward is *Bodianus fulvus*, also called 'yellow fish' and 'butter-fish,' a dark variety of which is especially designated by 'nigger-fish.' The Spanish name for the group is guatfvere. They are brought to market.

NIGGER-TOES. See BRAZIL-NUTS.

NIGHT-APE. A nyctipithecine monkey. See DOUBOU COULI.

NIGHT-BLINDNESS. A form of amblyopia, or a limited ability to see in a faint light, due to defective power of retinal adaptation; nyctalopia. See SIGHT, DEFECTS OF.

NIGHTHAWK. The North American night-jar (*Chordeiles Virginianus*), numerous and well known in all temperate parts of the continent in summer, whence in winter it migrates to the tropics. It is about 10 inches long and 23 inches in expanse of wing. The gape is destitute of bristles. The tail is slightly forked. The general color is brown, much mottled, and marked with white. There is a white mark on the throat, in shape like the letter V, and a broad white bar, which extends across the first five primary wing-feathers, is plainly visible when the bird is near by and flying. The middle toe is provided with a comb-like process used by the bird to free itself of vermin. The nighthawk is seen pursuing its insect prey in the air, chiefly after sunset and before dawn, and attracts attention by its sharp, tearing cry. It also produces in its flight a remarkable hollow booming sound, "like blowing into the bung-hole of a barrel," in the moments of its perpendicular descent through the air, which has gained for it such rustic names as 'bullbat' and 'pyramidig;' also 'mosquito hawk.' Its movements in the air are extremely beautiful and rapid. When fat and plump, as it usually is on its southward migration, it is said to be good eating, and some are shot for that purpose. A closely allied species occurs in Texas and Mexico, and another in the West Indies. The latter is very generally known as the 'gie-me-a-bit,' from its very characteristic note. Nighthawks lay their eggs on the bare ground or on a flat rock or roof of a building. They are usually two in number, and are dull white, closely marked with fine specks of grayish brown. At rest these birds roost by squatting lengthwise on a large horizontal tree-

branch, and at once become nearly invisible. Compare WHIPPOORWILL. See Plates of NIGHTJAR, GUACHARO, ETC.; and of EGGS OF SONG-BIRDS.

NIGHT-HERON. A heron of the genus *Nycticorax*, intermediate in form between bitterns and herons, but with shorter and thicker bill than either, and legs shorter than in herons. The common night-heron or 'qua-bird' (*Nycticorax nycticorax*) is found throughout all warm temperate regions. The American bird, a subspecies to which the name *nervius* is given, is abundant in America and is partly a bird of passage. Its length is fully two feet. Its plumage is soft, the general color ash-gray, passing into black on the neck and head, and into white on the breast and belly; the back of the head is adorned with three very long white feathers, which hang down on the neck. The young are very different—grayish-brown marked with white above, and white streaked with blackish underneath. The nests are built in trees and usually many together, forming a heronry; eggs 4-6, dull blue. (See Plate of EGGS OF WATER AND GAME BIRDS.) The night-heron feeds chiefly by twilight or at night, and is never seen standing motionless like other herons, but walks about in search of prey by the sides of ditches and ponds, as its food consists chiefly of fishes, frogs, and other aquatic animals. Its cry is very loud and hoarse. Another species (*Nycticorax violaceus*) is found in the Southern United States. Its crown is white washed with buff, and it is therefore called the 'yellow-crowned night-heron.' It is more solitary than the common species, appearing singly or in pairs, and is also less nocturnal. Other species of night-heron are found in Africa and Australia.

NIGHTINGALE (AS. *nihtegale*, OHG. *nahtagalā*, Ger. *Nachtigall*, from AS. *niht*, night + *galan*, to sing). A justly celebrated migratory song-bird of Western and Central Europe, which is a warbler, closely related to the robin redbreast, and as large as a thrush—the *Daulias luscinia* of modern ornithologists. It is rich brown in color, the rump and tail reddish, the lower parts grayish white. The sexes are alike. It is plentiful in some parts of the south and east of England, but does not extend to the western counties, and never appears in Ireland. It frequents thickets and hedges, and low damp meadows near streams. It arrives in England about the middle of April, the males ten to fourteen days before the females. It is at this season, and before pairing has taken place, that bird-catchers generally procure nightingales for cage-birds, as they then become easily reconciled to confinement, while if taken after pairing, they fret and pine till they die. The nightingale makes its nest generally on the ground, but sometimes on a low fork of a bush. The nest is loosely constructed of dead leaves, rushes, and stalks of grass, with a lining of fibrous roots. The eggs are four or five in number, of a uniform olive-brown. The song of the male ceases to be heard as soon as incubation is over, and Newton remarks that it is not safe for novelists to represent it as singing before April 15th or after June 15th. In captivity, however, it is often continuous throughout the year, especially in roomy aviaries. The nightingale usually begins its song in the evening and sings with

brief intervals throughout the night. The variety, loudness, and richness of its notes are equally extraordinary; and its long quivering strains are full of plaintiveness as well as of passionate ecstasy. The nightingale has been a favorite from the most ancient times, and is often mentioned in the poetry of India and Persia, as well as of Greece and Rome, but the bird referred to by these Eastern writers is in most cases a larger species (*Daulias philomela*), the 'philomel,' 'sprosser,' or 'thrush-nightingale,' which is never seen west of the Rhine; or else a third species (*Daulias Hafisi*) of Persia and Turkestan. The bird also has a place in classic mythology in the story of Procne and Philomela. Consult: Newton, *Dictionary of Birds* (London and New York, 1893-96); Burroughs, *Winter Sunshine* (Boston, 1876). See Colored Plate of SONG-BIRDS with THRUSH.

NIGHTINGALE, FLORENCE (1820—). An English philanthropist, born at Florence, Italy, the daughter of William Edward Nightingale, of Embley Park, Hampshire. Her attention was early directed to the condition of hospitals; she traveled extensively on the Continent to study such institutions, and entered upon a course of training in nursing with the Sisters of Saint Vincent de Paul in Paris and at the Kaiserswerth institution on the Rhine. When the Crimean War broke out in 1854, she organized a nursing department at Scutari, and by her untiring energy and extraordinary ability in alleviating the suffering of the sick and wounded acquired a world-wide reputation. At the close of the war she gave a testimonial fund of £50,000 to the founding of the Nightingale Home at Saint Thomas Hospital for the training of nurses. During the American Civil War and during the Franco-Prussian War she was often consulted on questions concerning camp hospitals. Among her publications are: *Notes on Hospitals* (1859); *Notes on Nursing* (1860); *Notes on the Sanitary State of the Army in India* (1863); and *Life or Death in India* (1874). Consult Edge, *A Woman's Example and a Nation's Work* (London, 1864).

NIGHTJAR. A general term, derived from their nocturnal habits and jarring utterances on the wing, for the large family Caprimulgidae (i.e. 'goat-suckers'), which is nearly cosmopolitan in extent. Nightjars are birds varying in size from eight to fifteen inches in length; all have light soft plumage, in finely mottled shades of gray, brown, and white; and they bear many resemblances to owls in structure as well as in their nocturnal and crepuscular habits. In some particulars they resemble the swifts, and, like them, capture all their food upon the wing; and, as moths form a conspicuous part of this, the tribe has been called 'moth-hunters.' In pursuit of this prey they are often seen in the dusk about pastures with the cows or (in Southern Europe) with the goats; and their habit of dodging about the cattle after insects, together with their capacious mouths, led to strange superstitions which are entirely without foundation. The wings are long and powerful, and in the males of some species are furnished with long ornamental feathers (see STANDARD-WING); while in others some tail-feathers are lengthened. The legs and feet are small and weak, and the middle toe is usually remarkably long, and serrated on

NIGHTJARS, GUACHARO, ETC.

1. STANDARD-WINGED NIGHTJAR (*Cosmetornis vexillarius*).
2. BRAZILIAN FORK-TAILED NIGHTJAR (*Hydropholis furcifer*).
3. MALACCAN FROGMOUTH (*Batrachostomus stellatus*).
- 3a. BEAK OF FROGMOUTH from above.

4. AMERICAN NIGHT-HAWK (*Chordeiles Virginianus*).
5. MOREPORK (*Podargus Cuvieri*).
6. OIL-BIRD, or GUACHARO (*Steatornis Caripensis*).
7. PENNANT-WINGED NIGHTJAR (*Macrodipteryx macrodipterus*).

its inner edge, so as to form a kind of comb attached to the toe. Although the bill is very short and weak, the gape is extremely wide, as if the head itself were divided, and the mouth is surrounded by bristles, assisting the bird in securing its agile prey. All avoid activity in daylight, when they rest quiet on the ground, a log, stone, or large horizontal tree-branch, in some shady place, and almost always lengthwise of the perch—a habit due not only to the feeble grasping power of the feet, but to the greater invisibility thus obtained. In many instances the birds have a further protective habit of stiffening themselves in certain positions where they resemble a knot, or a broken and projecting stick, and so escape notice. (See MOREFORK.) They make no nests, or only very poor ones, which are placed on the ground. The oblong eggs are usually two, and are whitish or inconspicuously marked. (See Colored Plate of Eggs or SONG-BIRDS.) The voice is a screaming, jarring, or booming note, produced in flight; while many species have an oft-repeated cry, usually translatable into syllables, as 'whip-poor-Will' or 'chuck-Will's-widow.' About 100 species are known, included in about fourteen genera. Of these, four or five genera with six species occur in the United States. The best known are the whippoorwill, chuck-Will's-widow, poorwill, and nighthawk (q.v.). The best-known species of the Old World is the common nightjar, 'churn-owl,' or 'fern-owl' (*Caprimulgus Europæus*), familiar throughout Central Europe, the Mediterranean region, and Western Asia. The potoos (q.v.) of Jamaica and South America represent a distinct subfamily (*Nyctibiinæ*), and an aberrant form is the guacharo (q.v.).

Consult standard authorities, especially Newton, *Dictionary of Birds* (London and New York, 1893-96). See Plate of NIGHTJARS, ETC.

NIGHTMARE (*night* + *mare*, AS. *mara*, OHG. *marō*, *mar*, dialectic Ger. *Mahr*, *Mar*, incubus; connected with Polish *mora*, Bohem. *mura*, incubus, Russ. *kiki-mora*, ghost). A sensation of distress, suffocation, or oppression which occurs during sleep, and is attended by hideous dreams, or indefinite feelings of terror, with a sense of utter helplessness and inability to move or cry out. Nightmare is associated with disturbances of the circulation and respiration, and is most commonly caused by the taking of heavy meals or indigestible food shortly before going to bed. It occurs in persons of a nervous temperament, or in those subjected to severe mental strain or overwork. The physical symptoms of nightmare include groaning, flushing of the face, neck and chest, cold perspiration, or a general trembling of the body. The breathing is disturbed and sometimes stertorous. The pulse is irregular, but otherwise normal.

The night terrors of children may be regarded as a form of nightmare. The child sees some object which inspires him with fear, and springs up, screaming and protesting. He recognizes no one and has no remembrance of the circumstance in the morning. Other allied psychical conditions are observed in certain forms of incipient delirium, such as occurs in fevers, or as the result of alcoholic excesses. See DELIRIUM.

NIGHTMARE ABBEY. A novel by Thomas Love Peacock (1818). The hero is a caricature of Shelley.

NIGHTSHADE (AS. *nihtscada*, OHG. *naht-scato*, Ger. *Nachtschatten*, nightshade, from AS. *niht*, OHG. *naht*, Ger. *Nacht*, night + AS. *scada*, OHG. *scato*, Ger. *Schatten*, shade). The common name of certain plants of the natural order Solanaceæ, possessing the narcotic properties frequently developed in that order. Among them are some species of *Solanum*, particularly the common nightshade or black nightshade (*Solanum nigrum*), an annual or biennial slightly

BLACK NIGHTSHADE.

narcotic weed in waste places throughout the world. It has erect angular stems, ovate leaves, drooping lateral umbels of white flowers, and globose black berries. The leaves in a fresh state are said to be injurious to animals, but seem to lose almost all narcotic property by boiling. The berries, although generally dreaded or suspected, may also, it is said, be eaten, at least in moderate quantity, without danger. They contain, however, the alkaloid solanin, found also in the shoots of the potato. *Solanum dulcamara* is popularly known as bittersweet (q.v.). See BELLADONNA, and Colored Plate of POISONOUS PLANTS.

NIGHTSHADE FAMILY. A natural order of plants. See SOLANACEÆ.

NIGHT WALKER, THE, OR THE LITTLE THIEF. A comedy by Fletcher. It was written probably not later than 1618, was altered by Shirley in 1633, and performed in 1634.

NIGHT WATCH, THE. A large picture by Rembrandt in the Ryks Museum at Amsterdam (1642), representing a company of arquebusiers under Capt. Frans Banning Coch coming out of their guild house. The faces are portraits. The painting is Rembrandt's largest and most renowned work.

NIGIDIUS FIGULUS, PUBLIUS (c.100-44 B.C.). A Latin grammarian and Pythagorean philosopher. He was pronounced by Aulus Gellius the most learned of the Romans next to Varro, and was so celebrated as an astrologer that in later times it was believed he had predicted the future greatness of Octavianus on learning of the latter's birth. He was a partisan of Pompey in the Civil War, and in consequence was compelled by Cæsar to live abroad, and died in exile. The surviving fragments of his works, which treated grammar, religion, and

the natural sciences, are printed in the *Varia Lectiones* (1618, iii. 16) of Rutgersius. Consult: Breysig, *De Nigidii Figuli Fragmentis* (Berlin, 1854); Klein, *De Vita Nigidii* (Bonn, 1861); Röhrig, *De Nigidio Figulo* (Coburg, 1887); and Swoboda, *P. Nigidii Figuli Operum Reliquiæ* (Vienna, 1889).

NIGBA, nē'grā, COSTANTINO, Count (1827—). An Italian diplomatist, born at Castellamonte, near Ivrea. He interrupted his studies at Turin to take part in the war against Austria (1848-49), and then entered the diplomatic service and became secretary to Cavour. After the Peace of Villafranca (1859) he was sent to France as Minister Plenipotentiary. He took an active part in the negotiation of the Treaty of Zurich in 1859, and the cession of Savoy and Nice to France, and was made Ambassador to Paris (1861). After the fall of the Empire he became Ambassador at Saint Petersburg (1876-82), London (1882-85), and Vienna (1885), and in 1890 was elected Senator.

NIGRITIA, nē-grish'e-ā. Another name for the Sudan.

NIHILISM (from Lat. *nihil*, *nil*, nothing, from *ne*, not + *hilum*, trifle, little thing). A term applied to the tenets of the revolutionary wing of the Russian Liberal Party. The term was first used in a novel by Ivan Turgenieff, *Fathers and Sons*. Originally it was a school of philosophic and ethical individualism which held aloof from political agitation. In the common mind Nihilism is associated with assassination and revolution, since Russian Nihilists seek to overthrow the present Government by force. The movement which resulted in the formation of the Nihilistic Party began early in the nineteenth century. As early as 1818 those who aspired for greater freedom in Russia formed an association to further the common welfare. On December 26 (old style, 14), 1825, occurred the celebrated rising of the Decembrists among the officers and soldiers of the army, which aimed at the emancipation of the serfs and the introduction of constitutional government. The revolt was easily quelled, and six leaders were executed; 125 others were imprisoned or exiled. Toward the middle of the century liberal ideas received an impetus from the study of socialistic writers of other countries. On April 23, 1849, some thirty-three men were arrested who belonged to an association formed by Petrashevsky, an official of the Foreign Office. These were sentenced to death, but the sentences were commuted to imprisonment and banishment. There were no further disturbances during the reign of Nicholas I.

In 1857 Alexander Herten founded in London his journal, the *Kolokol* (Tocsin), which had enormous influence upon the Russian youth. About this time there arose in Russia itself a literary movement, under the leadership of Tchernishevsky, which criticised existing society and sought to arouse the people. Tchernishevsky's paper was suppressed in 1862, but later he wrote a novel, *What is to be Done?* which had great influence in popularizing revolutionary ideas. Shapoff, writing from the historical point of view, urged the introduction of self-government and local autonomy. Organizations sprang up in the universities, and new regulations introduced by the Government increased the opposi-

tion of the students. The secret associations of Saint Petersburg united in 1863 under the name 'Land and Freedom.'

During the decade from 1860 to 1870 true Nihilism was first developed. Its fundamental principle was absolute individualism, the negation of duties imposed by family, State, and religion. An active materialistic propaganda was maintained. It stood for the rights of women and children, demanding equality of treatment for women, and in this respect it won a decided victory. But this individualism was confronted with misery among the common people which was not removed by the emancipation of the serfs. Economic conditions forced a change of policy and the development of political agitation. In 1868 Bakunin (q.v.) started a paper at Geneva, and became the leader of the anarchists, who gained control of the movement. Bakunin advocated the total abolition of the State and the substitution of small communes. The mir, or village commune (q.v.), had only to be freed from the State to make an ideal basis. The Russian students, forbidden in 1873 to study at Zurich, returned home to take active part in the propaganda. Associations sprang up throughout the land. Many of the aristocrats took part in this movement. The attention of the Government was of course attracted, and in 1873 and 1874 some 1500 persons were arrested. Most of these were released after a few months' imprisonment; the rest were confined for three or four years, and in 1877 193 were banished to Siberia. During this same period, and indeed at all times, there existed a more moderate party; but it did not satisfy the demands of the young men and women, particularly of the universities, which have been a hotbed of political agitation. About 1875 the 'Narodniki' became a prominent and widespread organization. It was under the leadership of the society at Saint Petersburg. The Government now became active, and during 1876 and 1877 the prisons were filled with propagandists. The trials of 1877 and 1878 mark the end of the first period of revolution. The number of persons involved in these trials was about 3800.

The attempts to organize the people into revolt now ended. The cruelty of the Government led to reprisals, and the Nihilism which began peacefully in the seventies took on another nature. At first spies of the Government were murdered. February 5, 1878, Vera Zassulitch, a young woman of twenty-eight, shot at General Trepoff, who had caused a prisoner to be whipped for refusing to take off his hat to him. She was tried before a jury of educated men, eight of whom held Government positions, and, to the general surprise, she was acquitted. The Government was enraged at this, and the verdict was annulled. August 4, 1878, General Mezentseff was killed in the streets of Saint Petersburg. On February 21, 1879, the Governor of Kharkov, Prince Krapotkin, was assassinated, and other attempts were made to assassinate hated officials. April 14, 1879, an attempt to assassinate the Emperor, Alexander II., was made by Solovieff, who was captured and hanged. Two later attempts were likewise failures, but the next (March 13, 1881) was successful. (See ALEXANDER II.) It was hoped that the terror inspired by the death of the Emperor would lead to the introduction of a constitutional system. When

this hope failed, constructive measures were sought. In 1880 two reform parties were prominent; one of them had as its mouthpiece the *Tcherny Perediel*, which found its chief support in the workmen, and proposed to educate and organize society in order that social revolution might be effected. The second and more important party was the *Narodnaia Volia* (Will of the People), which sought to overthrow despotism by the communistic instincts of the peasants. It set forth a programme with the following demands: (1) A representative assembly having supreme control in all State matters; (2) provincial self-government with elective officers; (3) village communes, which were to be economically and executive independent; (4) freedom of conscience, press, speech, association, and political agitation; (5) manhood suffrage; (6) militia instead of a standing army; (7) nationalization of land; (8) measures to socialize factories, etc. The *Narodnaia* practically dissolved in 1884. With its downfall there came a period of quiet in the social movement, although in the cities there still exists a reform movement among the workmen. See **COMMUNISM**; **SOCIALISM**.

Consult: Turgeneff, *La Russie et les Russes* (Paris, 1847); Herten, *La conspiration russe de 1825* (London, 1858); Thun, *Geschichte des russischen Nihilismus* (Basel, 1883); Stepniak, *Underground Russia* (London, 1883); id., *Russia Under the Tears* (ib., 1885); Tikhomirov, *Russia, Political and Social* (ib., 1887); Oldenburg, *Der russische Nihilismus* (Leipzig, 1888); Stegmann, *Handbuch des Socialismus*, article "Russland" (Zurich, 1897); Karlowitsch, *Die Entwicklung des russischen Nihilismus* (3d ed., Berlin, 1880), a convenient short history of the movement; Kennan, *Siberia and the Exile System* (New York, 1891); Krapotkin, *Memoirs of a Revolutionist* (Boston, 1899).

NIHONGI, *nēhōn-gē'* (Jap., Chronicles of Japan). An ancient Japanese historical book. In A.D. 712 the *Kojiki* (Records of Ancient Matters), the first book written in Japan, appeared. It was followed in 720 by the *Nihongi*, which gives the substance of the *Kojiki* in Chinese form. Not only are Chinese phrases and sentences employed, but it is fashioned throughout on the model of Chinese histories. It transforms, for example, the two gods from whom sprang the Japanese race into the 'positive' and 'negative' principles of the Chinese philosophy, and it puts into the mouths of mythical Japanese monarchs speeches filled with quotations from the Chinese classics. It omits a few legends, explains away the grossness of a few others, and gives variant versions of still others. It adds also 72 years of history. In Japan it has far excelled the *Kojiki* in popularity, but to the serious student it is of much less value, though it is still a secondary source for the history of ancient Japan.

NIIGATA, *nē-gā'tā*. A seaport on the west coast of Hondo, Japan, and capital of a prefecture, at the mouth of the Shinano River, in latitude 37° 55' N. and longitude 139° 3' E. (Map: Japan, F 5). By the treaty of 1858 Niigata was opened to foreign commerce on January 1, 1869, but the existence of a heavy bar at the mouth of the river has prevented its commercial development. The Province of Echigo, in which Niigata lies, abounds in mineral wealth, petro-

leum, coal, and metals, and the soil yields rice, silk, tea, and the lacquer tree, and inferior lacquer ware is manufactured at Niigata on a large scale. The town is clean, and well provided with schools, banks, newspapers, and post offices. The climate is very hot in the summer and extremely cold in the winter. Population, in 1898, 53,336.

NIJAR, *nēhār*. A town of Southeastern Spain, in the Province of Almería, situated in an artificially irrigated plain, 15 miles northeast of Almería (Map: Spain, D 4). There are mines of lead, iron, manganese, and phosphorite, and the town manufactures woolen blankets and fine ironstone pottery. Population, in 1900, 12,558.

NIJKERK, *nī'kērk*. A town in the Province of Gelderland, Holland, 28 miles southeast of Amsterdam (Map: Netherlands, D 2). It has a good harbor connected with the Zuider Zee by a wide canal two miles long. The chief industries are matting and flax-spinning; a brisk trade is carried on in grain, wood, and cattle. Population, in 1899, 8124.

NIJMEGEN, *nī'mā-gen*. A city of the Netherlands. See **NIMEGUEN**.

NIJNI-NOVGOROD, *nyēzh'nyē nōv'gō-rōd*. A city in Russia. See **NIZHNI-NOVGOROD**.

NIKA (*nē'ka*) **BIOT**. An insurrection against the Emperor Justinian at Constantinople in 532. It was occasioned by the oppressive taxation and the fights between the Blue and the Green factions of the Circus. Justinian favored the Blues at first, but soon both Blues and Greens joined in a popular uprising. Justinian yielded to their demands for reform, and this encouraged the mob, who set fire to the city. Saint Sophia and many public buildings were burned. The mob forced Hypatius to assume the Imperial insignia, and Justinian wished to flee, but was dissuaded by Theodora. Finally Belisarius (q.v.) attacked the rioters in the hippodrome, and put down the rebellion by the slaughter of as many as thirty thousand. See **JUSTINIAN**.

NI'KE (Gk. *νίκη*, victory). The Greek goddess of victory, corresponding to the Roman Victoria. She was the daughter of Styx and Pallas, and sister of Zelos (zeal), Cratos (power), and Bia (force). Having assisted Zeus in his combat with the Titans, she was taken to live with him on Olympus. She is usually represented with wings and bearing a wreath and palm branch, and is often found in sculpture in connection with other divinities, especially with Athena, who is also called Nike.

NIKE APTEROS (Gk. *Νίκη Ἀπτερος*, Wingless Victory), or **ATHENE NIKE**, **TEMPLE OF**. A beautiful small temple of simple Doric architecture standing on a bastion flanking the entrance to the Athenian Acropolis. The temple was erected as part of the scheme of beautification of the city undertaken by Pericles, and was built by Callicrates, the architect of the Long Walls. It was torn down by the Turks in the latter part of the seventeenth century, and the material was used in the construction of a bastion. Lord Elgin took some of the slabs of its frieze to London. In 1835, when the bastion was destroyed, the stones of the building were recovered, and the temple was rebuilt on the original foundation, missing portions being supplied by terra-cotta casts. The temple, 18 by 27 feet, consists merely of a small cella, with four

Ionic columns, 13½ feet high, in the front and rear. The sculptures of its frieze represented an assembly of divinities, combats between Greeks and Persians, and a combat between Greeks and Greeks. The balustrade surrounding the precinct of the temple was adorned with reliefs of sacrifices in honor of Athena, to whom the temple was consecrated under the name of Nike Apteros, in order to distinguish her from the usual winged representations of Nike.

NIKISCH, ARTHUR (1855—). An Hungarian musical conductor, born at Lébény Szent-Miklós. He was educated under Dessoff and Hellmesberger at the Vienna Conservatory, and on the conclusion of his course entered the Court orchestra as a violinist. His first engagement as a conductor was at the Leipzig Theater. Here he became noted for conducting without score, while his ability and technical skill won him a leading place. From 1889 to 1893 he was conductor of the Boston Symphony Orchestra, succeeding Wilhelm Gericke, and being in turn succeeded by Emil Paur. He returned to Pesth, where he was appointed the director of the Royal Opera House and conductor of the city Philharmonic Society concerts. His most important musical engagement and the scene of his greatest success was as the successor of Reinecke (1895) in the conductorship of the Gewandhaus concerts of Leipzig.

NIKITA, nê-kê'tâ, LOUISE (1872—). The professional name of Louisa Margaret Nicholson, an American singer, born in Philadelphia. She studied in Paris under Maurice Strakosch, and sang there and in Germany with considerable success. Her operatic début was in 1889 as Zerlina in *Don Giovanni*, and in 1894 she became prima donna at the Paris Opera. Her best-known rôles are in *Fille du régiment*, *Manon*, *Traviata*, *Lakmé*, and *Pagliacci*.

NIKITIN, nyê-kê'tyên, IVAN SAVITCH (1824-61). A Russian lyric poet, born at Voronezh. He began to write for the press in 1850; attracted attention by his patriotic poem *Russia* in 1853; and in 1856 had a volume of poems published under the patronage of Count Tolstoi. His greatest popularity was won by his poem *Kulak*, or 'The Money-Lender' (1858), a remarkable picture of peasant life. Besides his lyrics, Nikitin wrote two novels. A collected edition of his works was published at Moscow (6th ed. 1892).

NIK'KO (Jap., Sun's Brightness). A town and tourist resort in the Prefecture of Tochigi, Japan, about 80 miles northwest of Tokio, famous for its natural beauties, as well as for the mortuary shrines of Iyéyasu, the founder of the Tokugawa family, and of Iyémitau, his grandson (Map: Japan, F 5). As a holy place its reputation dates from the eighth century, but the gorgeous mortuary shrines were not built until 1617, since which time they have been embellished by the lavish gifts of vassals, the wonders of Hidari Jin'goro's wood carving, magnificent gifts of works of art in bronze, granite, and other stones, with offerings from the Dutch, Loo-Chooans, Koreans, etc. The name Nikko is also applied to the surrounding region.

NIKLA URSS, nê'klâ urs (Rum., Nicholas the Bear). A popular name for a Rumanian patriot, Juon Hora (q.v.).

NIKOLAYEV, nyê'kô-lâ'yêv. An important naval and commercial river port in the Government of Kherson, South Russia, situated on the river Bug, 42 miles northwest of Kherson (Map: Russia, D 5). The river at Nikolayev is of sufficient width and depth for the largest vessels. The town has two gymnasias, a naval school, an observatory, a theatre, and a number of parks. Nikolayev is among the largest commercial ports of Russia. It is especially important in the export of grain, the imports being comparatively insignificant. The harbor is strongly fortified, and the navy yard with its wharves and various shops covers a large area. The industrial establishments, except those connected with the navy yard, are few and consist of tobacco factories, tallow-melting establishments, etc. The city forms a separate administrative district under a military Governor, who is also commander-in-chief of the Black Sea fleet. There are many consular representatives at Nikolayev.

Population, in 1897, 92,060, of whom about 75 per cent. were Greek Orthodox, and about 17 per cent. Jews. Nikolayev was founded by Potemkin in 1784. Until 1860 it was only a naval port, which played a prominent part in the building up of the Russian navy.

NIKOLAYEVSK, nyê'kô-lâ'yêfsk. A town in the Government of Samara, Russia, situated on the Great Irigiz, a tributary of the Volga, 110 miles south-southwest of Samara (Map: Russia, G 4). It carries on a brisk trade in agricultural products and animals, and produces brick, leather, and tallow. In the district of Nikolayevsk are a number of prosperous German colonies. The town was founded by the Raskolniks (dissenters) in 1782. Population, in 1897, 12,500, chiefly Raskolniks, and including about 1900 Tatars.

NIKOLSBURG, nê'kôls-bôörk. A town of Moravia, Austria, situated about 30 miles south of Brünn (Map: Austria, E 2). On a rock near the centre of the town stands the castle of the princes of Dietrichstein, to whom the town has belonged since 1675. There are a number of churches, a higher gymnasium, a library, and a natural history museum—the two last in the castle. In the vicinity of the town is produced good wine. Nikolsburg is noted for the peace concluded there between Ferdinand II. and Bethlen Gábor in 1622, and the armistices between Prussia and Austria and Prussia and Bavaria in 1866. Population, in 1900, 8091.

NIK'ON (1605-81). A patriarch of the Russian Church. He was born near Nizhni-Novgorod, became a priest and monk, and in 1646 was appointed, by the Czar Alexis Mikhailovitch, Archimandrite of the Novospasky Monastery at Moscow. In 1648 he became Metropolitan of Novgorod, and in 1652 was elevated to the patriarchate. In 1658, having lost the favor of the Czar, he retired to the Monastery of the Resurrection of Christ, which he had himself built, and in 1666 was deposed by a council called to consider his case, and banished as a common monk to a monastery at Bielozersk. Czar Feodor Alexeyevitch granted him permission to return to the Monastery of the Resurrection of Christ, but he died on the journey thither. Nikon was an ardent upholder of monasticism, and was noted for his benevolent life and character, showing much kindness to the poor and unfortu-

nate. He tried to uplift the people, promoted education, and attempted to introduce many reforms into the Church, the most important of which was the effort to revise the Church books and correct them according to the old Eastern liturgies. This effort met with opposition from some who were opposed to change, and led to a division in the Church. See RASKOLNIKS. Consult Palmer, *The Patriarch and the Tsar* (London, 1871-76).

NIKOP'OLI, or **NICOP'OLIS**. An ancient and fortified town in the north of Bulgaria, situated on the right bank of the Danube, about 24 miles north-northeast of Plevna (Map: Balkan Peninsula, E 3). It is commanded by a citadel and has an old castle and a Byzantine church. The surrounding country produces good wine, and there is some trade between Nikopoli and Wallachia. Nikopoli is noted for the defeat here in 1396 of a large Christian army under Sigismund of Hungary by the Turks under Bajazet I. The fortress was occupied by the Russians in 1810, and the fortifications were partly demolished. In 1829 a Turkish fleet was defeated by the Russians near Nikopoli, and in 1877 the town was nearly destroyed by the Russian army. The Nikopolis ad Istrum, founded by Trajan, with which Nikopoli is sometimes identified, is now believed to have been situated a few miles down the river.

NILE (Lat. *Nilus*, from Gk. *Νεῖλος*, *Neilos*, Nile; possibly connected with Heb. *nahal*, stream, Egyptian *H'pi*), **THE**. The largest river of Africa, and the longest in the world excepting the Missouri-Mississippi, its length from the Victoria Nyanza to the Mediterranean being about 3670 miles. Authorities have definitely ascertained that the fountainhead of the Nile is a little stream situated just north of latitude 3° S., in longitude 29° 30' E., near the northern extremity of the mountains bordering the northeast coast of Lake Tanganyika. This stream, rising among the mountains at a height of 6114 feet above the sea, gives birth to the Ruvuvu River, which is the mother branch of the Kagera or Alexandra Nile, emptying into Victoria Nyanza on its west coast. The area of the Nile's basin has been estimated at from 1,082,000 to 1,780,000 square miles. The general course of the river is from south to north, and though it has some largely developed sinuosities, its delta is almost directly north of the Albert Nyanza, which the Nile enters and from which it emerges, the delta and lake being separated by a distance of about 2000 miles.

The Nile has some special features that may be mentioned before describing it. While the river and its tributaries bring down from the tropics an enormous quantity of water, little of it reaches the sea, except at high flood, as nearly all the water that does not evaporate in the long journey northward is spread over the fields of Egypt, where it serves the double purpose of supplying moisture and fertilizing sediment. Its upper and its lower courses are navigable. Its middle course is not navigable except at very high flood, and then only with difficulty. The six cataracts of the Middle Nile extend along 1100 miles, with long stretches of smooth water between them; but this entire section of the river may be regarded as unavailable for very important navigation. These Nubian cataracts afford abun-

dant water power, but it has never been utilized. Like all large rivers flowing north and south, the Nile tends to impinge more strongly upon its right bank, owing to the revolution of the earth from west to east. The boundary of the Nile basin is more clearly outlined in the south than in the north. The river differs from all other great African rivers in that it passes through various climatic zones and departs very little from its main direction.

The Nile may be divided into four sections—the Upper, Middle, and Lower Nile, and the Delta, each having its distinctive aspects. The Upper Nile extends from the lakes to the confluence of the Blue and White Niles at Khartum. It is distinguished as being the region of tributaries, all of them being included excepting the Atbara, which is not perennial. It is also the region of heavy tropical rains. Three great reservoirs receive the numerous affluents in the equatorial regions. The Nile issues from the largest of these reservoirs, the Victoria Nyanza, which is nearly equal to Scotland in area, and lies 3900 feet above the sea. The river, issuing from the middle of the north shore of the lake, plunges 13 feet over Ripon Falls, and is 1200 feet wide where its waters start on their journey north. This is the Victoria or Somerset Nile. It flows to the northwest, passes through the small Gita and Kioga lakes, down the Karuma rapids, thunders over Murchison Falls (120 feet high, 270 miles from the outlet), and then pursues a peaceful course for about 30 miles till it empties into the northeast corner of Albert Nyanza, only to emerge at the northern apex of the lake as the Bahr-el-Jebel, a deep and majestic stream, bound on its long journey to the Mediterranean. South of Albert Nyanza is Lake Albert Edward, sending its waters, collected chiefly from the great mountain mass of Rowenzori, through the Semliki River to Albert Nyanza, which is 1600 feet below the level of the Victoria Nyanza. The headwaters of the Upper Nile are thus collected in the Albert Nyanza. From the Albert Nyanza the river descends with slow current and scarcely any slope to Dufile, where it passes between two mountain walls. Soon after leaving the mountains the slope becomes greater, the river foams over the Fola Rapids, leaves the plateau of Central Africa, enters the grass lands, and below Bor its banks are lost in the wide-spreading swamps on either side, and the channel splits into several branches, the Bahr-el-Jebel, the Bahr-el-Seraf, and others, which meet again in Lake No or farther down the river. In Lake No, the Bahr-el-Jebel meets the large tributary from the west, the Bahr-el-Ghazal (Gazelle River), and they leave the lake as the Bahr-el-Abiad or White Nile, which owes its name to the fact that in the sluggish current through the swamp region and in Lake No the sediment settles, leaving the river light in color, and this is accentuated farther down by the white waters of the Sobat tributary.

This area of swamps and branches is the vast region of the sudd (barrier), where all the channels are often completely choked by dense masses of vegetation. The current brings down fresh masses of weed and the sectional area of the river channel is quickly reduced. The velocity of the current is consequently increased, and the succeeding portions are sucked under the original block, thus adding to its thickness. By degrees, under the severe action of the water,

the whole becomes compressed into a dense and solid mass, which covers the river surface from bank to bank, and underneath which the stream rushes as through a sluice gate. These blocks at times attain a thickness of 15 feet below the water and 4 or 5 feet above it. The surface in places is so solid that hippopotami and even elephants can cross it without danger. Navigation of the river is thus rendered impossible. In 1899-1900, after the reconquest of the Sudan, the Government attempted with much success to open navigation in the main channel by cutting down into the sudd, tearing the sections away by steamboats, and setting the masses thus separated afloat. This region is very unhealthful and the inhabitants are few. It is believed that the swamp and sudd region embraces an area of about 12,000 square miles. All the streams are reunited 62 miles below Lake No and receive on the right bank the Sobat River, coming from the southern extension of the Abyssinian highlands, a navigable river for 212 miles from its mouth. Below the Sobat, the White Nile takes a definite northern course and flows, a mighty, though sluggish stream, to Khartum, where the White and the Blue Niles mingle their waters.

The Blue Nile is a very different river. It rises in the Alpine heights of Abyssinia, descends to the White Nile between its high banks with a very rapid current, and in the flood time it is reddened by the quantities of alluvia with which it is surcharged. The White Nile gives to Egypt the larger quantity of water; the Blue Nile spreads over the fields the fertile sediment that enriches them. Thus each had its distinctive function in creating Egypt out of the desert sands. Khartum, at the junction of these rivers, is at the heart of the great hydrographic system, and is naturally the metropolis of the Eastern Sudan. The Blue Nile, from its great reservoir, Lake Tsana, 5840 feet above the sea, has a winding course of 839 miles down the plateau and over the plain to Khartum. Much land in its valley is suitable for agricultural development. The river needs scientific regulation so that it may best serve the interests of Egypt. Under the agreement with King Menelek of Abyssinia (1902) for the delimitation of the boundary between his country and the Sudan, the Egyptian Government has authority to regulate the flow of water in the upper river. The Cape to Cairo Railroad will follow the Blue Nile for a considerable distance above Khartum, to avoid the swamp region of the White Nile.

From a little below Khartum to the Mediterranean the river flows through one of the most arid deserts in the world, without receiving a single tributary excepting the Atbara, 180 miles below Khartum, which drains the northern highlands of Abyssinia, but is nearly dry in summer. Throughout this long course, the valley of the Nile is merely a cleft in the desert plateau, the alluvial plain along the river being bounded by barren cliffs, which here and there rise to 1000 feet. The volume of the river is greatly depleted by evaporation in this part of its course. The second section of the river, the Middle Nile, extends from Khartum to Assuan, a distance of 1124 miles. It is a region of cataracts, there being 351 miles of rapids, with a total fall of 656 feet, and 773 miles of navigation, with a fall of 312 feet. The cataracts, in their order as the

river is descended, may be briefly described: The Sixth Cataract, beginning 52 miles below Khartum, is a little over one mile long, and the drop in the river is 20 feet. The Fifth Cataract begins 28 miles north of Berber, is 100 miles long, has three principal rapids, and the descent is over 200 feet. Abu Hamed is a little below the foot of this cataract. The Fourth Cataract is between Abu Hamed and Dongola, and drops 160 feet in 68 miles. The very fertile region of Dongola is between the Fourth and the Third cataracts. The Third Cataract, with two rapids, is 45 miles long and the fall in the river bed is 36 feet. The Second Cataract is 73 miles farther down the river, is 124 miles long, with four rapids, and it falls 216 feet. The town of Wadi-Halfa lies at its foot. The First Cataract is 214 miles farther down the Nile, is three miles long, drops 16 feet, and Assuan lies at its foot. The fact that below Assuan lies the great region of irrigation, fertility, and dense population, and that this portion of the Nile is hemmed in by high hills, marked Assuan as the best place to build a great dam across the river to keep back at flood time much of the water which hitherto had gone to waste, so that it might be utilized in the dry season and give Egypt perennial irrigation.

The third section of the river is the Lower Nile, extending from Assuan to the head of the Delta, an open waterway, navigable by large vessels, with Cairo near its foot. The current is slow during the low river in summer—less than two feet a second. The velocity in flood is from $3\frac{1}{4}$ to $6\frac{1}{2}$ feet per second. Along the lower part of this section a divergent channel known as the Bahr-Yusuf (Joseph's Canal) extends parallel to the Nile on the west side, finally discharging its waters in the depressed area of the Fayum (q.v.). The fourth section of the river is the Delta or 'Garden of Egypt.' It is pierced in all directions by irrigation canals and navigable channels. When the Nile is in flood, its tendency is to increase the height of its banks by deposits of loam and sand. These banks are artificially strengthened and the river thus kept to a definite course. The river reaches the sea through the Rosetta and Damietta mouths, and the canals that cover the Delta like a network carry their surplus waters into a chain of salt lakes that extends behind the sandy shore. As a drainage outlet, a navigable highway, and a source of power the Nile is surpassed by many other rivers. Its unique distinction is that it has turned Egypt from a desert into one of the richest agricultural lands, supporting a population of about 600 to the square mile. There are periods of exceptional flood and low water; but the extraordinary regularity with which, as a rule, the river rises and falls contributes to the security of farming.

The heavy rains in the basin of the White Nile during April drive the waters of that marshy region down upon Egypt, where they appear at Cairo about June 15th. A fortnight later the real flood begins, for the May rains in Abyssinia fill the Blue Nile with the richest muddy water. The rise is sometimes as rapid as three feet a day, the flood being heightened by the large volume brought down by the Atbara. The maximum flood reaches Assuan about September 1st, and it would be at Cairo a few days later were it not that the water is diverted to the land and the whole Nile Valley is a great lake. For this

SCENE ON THE NILE

reason the maximum flood at Cairo appears only about October 1st. The rains cease in Abyssinia about the middle of September, the floods of the Blue Nile and the Atbara disappear, and then the great lakes and marshes of Central Africa are the main supply of the river until the following June. This routine of the waters is marked by marvelous regularity. The time between an early and a late flood is not more than three weeks. The height of the flood at Assuan is usually about 25 feet above the minimum supply. If the water rises 29 feet above the minimum, the crops of Egypt are in danger. If it rises only 20 feet above the minimum, large areas cannot be flooded. The mean flood discharge at Cairo is about 280,000 cubic feet per second (about equal to the average flow of the Niagara River), the maximum about 400,000 feet. The general slope of the valley on each side is away from the river. Along each edge of the river is an earthen embankment too high to be topped by the floods. Along the valley is a series of embankments, one end of which is at the river edge and the other on the sides of the hills that wall in the valley. The whole country is thus divided into a series of oblongs surrounded by artificial embankments on three sides and by the slope of the desert hills on the fourth. There are 120 of these oblongs, varying in extent from 60,000 to about 3000 acres. It is easy to cut short, deep canals in the banks which fill as the flood rises and carry the mud-charged water into these basins of irrigation. There the water remains for a month or more, three to four feet deep, depositing its mud. At the end of the flood the water is passed off through sluices from one basin to another and ultimately back into the river. In November seed is sown, and so saturated is the soil that the grain sprouts and thrives and the harvest is gathered in April or May without a drop of rain or any fresh irrigation. After the crop is reaped the fields remain dry and cracked in the fierce summer heat until the next flood comes on. A little below Cairo is a great dam or barrage across the river, by means of which all available water in the Nile before it begins to rise in June is diverted into canals that carry it to the cotton fields of the Delta. This barrage makes it possible to irrigate Delta crops in the dry season, so that to a large extent two crops a year are raised there. The water in the Delta would not be sufficient if a strict system of control were not maintained by which each cultivator is supplied in turn every fifteen or twenty days.

The great need has long been to store the waters during flood time (when a large part of them run to waste) so that they might be turned over the fields during the months of low Nile, thus giving to Egypt the benefits of irrigation at all seasons, and making it possible to raise two or three crops annually where only one or two were grown. Near Assuan, the gateway to Lower Egypt, the work on the great and much desired reservoir was begun. It was completed and formally opened in December, 1902. The work consists chiefly of an enormous wall or dam of masonry nearly 2 miles long and averaging 60 feet in height. The wall is pierced by 180 openings, each containing sluices through which the low Nile may pass and the retained flood waters may escape as they are needed for irrigation. A roadway runs along the top of the wall. It is estimated by Sir William Garstin that the vol-

ume of water impounded by the dam will reach the enormous total of 37,812,179,000 cubic feet. He estimates also that in the distribution of this reserve supply 70,000 acres in Upper Egypt, between Assuan and Assiut, will receive perennial irrigation; also 458,000 acres now irrigated as basins in Middle Egypt between Assiut and Cairo; that, further, 52,000 acres in the Fayum now untillied may be reclaimed; and that in Lower Egypt or the Delta the additional water will insure the cotton crop against drought, and reclaim an area of 120,000 acres now uncultivated. In the Province of Ghizeh likewise an area of 106,000 acres of basin cultivation will be converted into perennially irrigated land. Since the dam at Assuan closes the Nile to navigation, a canal 6540 feet in length with four locks is being constructed around it. Mail steamers and any stern-wheeler now on the Nile may pass through the canal, and sailing vessels may pass Assuan all the year round, though heretofore they have been able to get through the cataract only during high Nile. Below Assuan a barrage has also been constructed at Assiut for the purpose of raising the level of the river in summer, so that water may be delivered at that point at a higher level, increasing the discharge into the Ibrahimia Canal, which carries the supplies to the basins as far north as Minieh and Beni-Suef. These great works will add enormously to the productivity of Egypt, will increase the value of all the farm lands, and will augment the revenues of the Government. See EGYPT AND EGYPTIAN SUDAN.

BIBLIOGRAPHY. Most of the information on the Nile is scattered through official publications and books relating to Egypt, the Anglo-Egyptian Sudan, and the Lake Region of Central Africa. Among these are: Bruce, *Travels to Discover the Sources of the Nile* (3d ed., London, 1813); Beke, *The Sources of the Nile* (ib., 1860); Speke, *Journal of the Discovery of the Source of the Nile* (ib., 1863); Baker, *The Nile Tributaries of Abyssinia* (ib., 1867); id., *The Albert Nyanza, Great Basin of the Nile and Exploration of the Nile Sources* (ib., 1871); Chavanne, *Afrikas Ströme und Flüsse* (Vienna, 1874); Schweinfurth, *Heart of Africa*, trans. (2d ed., London, 1875); Ebers, *Aegypten in Bild und Wort* (Stuttgart, 1879; trans. as *Egypt, Descriptive, Historical, and Picturesque*, London, 1898); Poole, *Egypt*, in "Foreign Countries and British Colonies Series" (ib., 1881); Hartmann, *Die Nilländer* (Leipzig, 1884); Edwards, *A Thousand Miles Up the Nile* (London, 1889); Willcocks, *Egyptian Irrigation* (ib., 1889); Junker, *Travels in Africa*, trans. (ib., 1890-92); Budge, *Dwellers on the Nile* (ib., 1890); Chélu, *Le Nil, le Soudan, l'Égypte* (Paris, 1891); Baumann, *Durch Massailand zur Nilquelle* (Berlin, 1894); Gessi, *Sette anni nel Sudan egiziano* (Milan, 1891); *Report on Perennial Irrigation and Flood Protection for Egypt* (Cairo, 1894); *Report on the Nile and Country Between Dongola, Suakin, Kassala, and Omdurman* (2d ed., London, 1898); Stuhlmann, *Mit Emin Pasha ins Herz von Afrika* (Berlin, 1894); Colville, *The Land of the Nile Springs* (London, 1895); Brown and Carstin, *History of the Barrage at the Head of the Delta of Egypt* (Cairo, 1896); Wood, *Egypt Under the British* (London, 1896); *Notes on Egyptian Crops* (Cairo, 1896); Casati, *Ten Years in Equatoria* (London, 1898); White, *The Expansion of Egypt*

(ib., 1899); Willcocks, *The Nile Reservoir Dam at Assuan and After* (ib., 1901).

NILE GROUP. A large marble group, one of the most important Alexandrine works of art, representing the river god reclining and leaning on a Sphinx. About and over his body sixteen children are climbing and playing, emblematic of the sixteen cubits to which the Nile rises before overflowing the surrounding country. The god holds in his left hand a cornucopia with flowers and fruits, in his right a bunch of grain, types of the fructifying power of the inundation. The group was found near the Church of Santa Maria sopra Minerva, Rome, in the time of Leo X., and is now in the Vatican.

NILES, nilz. A city in Berrien County, Mich., 92 miles east of Chicago, Ill.; on the Saint Joseph River, and on the Cleveland, Cincinnati, Chicago and Saint Louis and the Michigan Central railroads (Map: Michigan, G 7). It derives excellent power from the river and has extensive manufactures of all grades of paper, furniture, windmills, steel tanks, flour, etc. There is also a large fan and lithographing establishment. The surrounding country is chiefly agricultural, and the river scenery is unusually fine. The government, as provided by general charter of 1896, is vested in a mayor, annually elected, and a unicameral council. The water-works and electric light plant are owned and operated by the municipality. Population, in 1890, 4197; in 1900, 4287. On or near the site of Niles stood Fort Saint Joseph, the capture of which by the Spaniards in 1781 was the basis of Spain's claim (in 1782-83) to a large tract of Western territory. The foundations of the old fort are still visible. Early records show that a French mission was here established as early as 1697, and a complete census of a settlement in 1767 is extant. Niles was settled permanently in 1828, ten years later was incorporated as a village, and in 1859 it received a city charter.

NILES. A city in Trumbull County, Ohio, 58 miles southeast of Cleveland; on the Mahoning River, and on the Erie, the Pennsylvania, and the Baltimore and Ohio railroads (Map: Ohio, J 3). It is primarily a manufacturing centre, these interests being represented by tin mills, automatic press works, sheet mills, boiler works, and manufactories of electric and steam cars, incandescent lamps, chinaware, iron roofing, metal lath, office supplies, foundry and blast furnace products, mine and mill supplies, and galvanized iron. Niles, first incorporated in 1864, is governed, under a charter of 1895, by a mayor, elected every two years, and a unicameral council. The city owns and operates the water-works and electric light plant. Population, in 1890, 4289; in 1900, 7468.

NILES, HEZEKIAH (1777-1839). An American journalist and publisher. He was born in East Bradford, Chester County, Pa., where he was educated in the village schools. He learned the printers' trade, and in 1800 established himself in the printing and publishing business in Wilmington, Del. Failing in business, he removed to Baltimore, Md., where he became associated with George Bourne in the editing of *The Evening Post*. In 1811 he began the publication of a weekly, largely devoted to politics and the discussion of public affairs, which he

called *Niles's Register*. This journal he continued until his death, removing the publication office in 1837 to Washington and renaming the paper *Niles's National Register*. In 1838 the office was moved back to Baltimore, and there the publication of the paper was continued after Niles's death until 1849 by his son, W. O. Niles, and others. The files of the paper from 1811 to 1849 constitute an invaluable source for the study of American political history during that period.

NILES, JOHN MILTON (1787-1856). An American journalist, politician, and Cabinet officer. He was born in Windsor, Conn., received a common school education, and studied law by himself. In 1817 he settled at Hartford, Conn., and established the *Times*, which, under the editorial control of Niles, whose connection with it lasted for thirty years, became one of the most influential newspapers in New England. It was one of the earliest papers in the section to give its support to Andrew Jackson for the Presidency, and after his election Niles received the appointment to the Hartford postmastership as a reward. In 1835 he was appointed United States Senator to fill a vacancy, serving until 1839. In 1840 he was appointed Postmaster-General in Van Buren's Cabinet, remaining in office until Harrison's inauguration. From 1843 to 1849 he was a member of the United States Senate. He published: *The Independent Whig* (1816); *Gazetteer of Connecticut and Rhode Island* (1817); *Life of Commodore Oliver Hazard Perry* (1820); *A History of the Revolution in Mexico and South America, with a View of Texas* (1829); and *The Civil Officer* (1840).

NILES, NATHANIEL (1741-1828). An American politician and theologian, born in South Kingston, R. I. He graduated at Princeton in 1766, later studied medicine and law, taught school in New York City, then studied theology, and preached in various Congregational churches in New England. While living at Norwich, Conn., he invented a process by which bar iron could be made into wire by the use of water power, and also established a wool-card manufactory. About the close of the Revolution he settled in Orange County, Vt., and founded West Fairlee. He was frequently a member of the Vermont Legislature, and in 1784 was Speaker; was later a judge of the State Supreme Court; was a Representative in Congress from 1791 to 1795; was six times a Presidential elector, and also helped, as a "censor," to revise the State Constitution. Shortly after the battle of Bunker Hill he composed a song, "The American Hero," which proved popular, and he later contributed essays to the *Theological Magazine*, and published a considerable number of books on theological and other subjects.

NILGAI, nil-gi' (Pers., Hind. *nilgau*, *nilgar*, *lilgar*, blue ox, from *nil*, Skt. *nīla*, blue + *gau*, Skt. *gau*, ox, cow). An East Indian antelope (*Bos-elaphus tragocamelus*) with a somewhat ox-like head and body, but with long, slender limbs, and of great activity and fleetness. It is one of the largest of antelopes, and stands about 4½ feet high at the shoulder. The horns of the male are about as long as the ears, smooth, black, pointed, slightly curved forward. The female has no horns. The neck is deep and compressed, not rounded, as in most of the antelopes. The general color is brownish gray. A slight mane runs

along the neck and the elevated forward part of the back, and the breast is adorned with a long hanging tuft of hair. The nilgai inhabits the bushy parts of India, where it has long been regarded as one of the noblest kinds of game. It is capable of domestication, but is said to manifest an irritable and capricious temper with advancing age. Consult Blanford, *Fauna of British India: Mammals* (London, 1889), and works on sport in India. See Plate of ANTELOPES.

NILGIRI (nêl-gê'rê) **HILLS**, or **NEIL-GHERRY HILLS**. An almost isolated plateau or mountain group in Southern India, Presidency of Madras (Map: India, C 6). It is situated about 40 miles from the west coast, 200 miles north of Cape Comorin, and rises in general to heights of between 3000 and 6000 feet above the surrounding plains, the highest point being Mount Dodabetta, with an altitude of 8760 feet. Granite ridges connect it with the neighboring Ghat Mountains, and it is itself composed of granite covered with a rich layer of soil. The slopes are covered with dense, hot, and unhealthy forest jungles, but the uplands consist of beautiful grassy plains with a temperate-zone flora and a delightful climate, which has made the Nilgiri Hills one of the principal sanatoriums in India for European invalids, who are chiefly concentrated in the town of Utkamand. The native inhabitants are Dravidian herdsmen.

NILOMETER (Gk. *Νειλομέτριον*, *Neilometrion*, from *Νεῖλος*, *Neilos*, Nile + *μέτρον*, *metron*, measure). A construction for measuring the height of the Nile. Two such constructions have survived from antiquity. The first is situated on the island of Roda, south of Cairo. This *mikyâs*, as it is called in Arabic, is a square well, 16 feet in diameter, with an octagonal graduated pillar of marble in the centre, marking 17 cubits of 21.386 inches. The official guarding it announces that the water has risen high enough to cut the dams and to begin the irrigation when the river has risen to 15½ cubits. Taxation was formerly regulated in accordance with the height of the inundation. This construction is due to the Caliph Suleiman, A.D. 715-717, but has been restored repeatedly since the ninth century. The other nilometer is situated on the island of Elephantine (q.v.), near the First Cataract. It consists of a well with a staircase of stone, and is very correctly described by Strabo. It was restored to official use in 1870.

NILSSON, nil'son, CHRISTINE (1843-). A Swedish soprano. She was born near Wexiö, and although her parents were in humble circumstances, she became proficient on the violin, learned the flute, and attended fairs and other places of public resort, at which she sang, accompanying herself on the violin. While performing in this manner at a fair in Ljungby in 1857, her voice attracted the attention of F. G. Tornerhjem, who sent her to Stockholm, where she received instruction from Franz Berwald. She made her début at Stockholm in 1860, and then went to Paris to continue her musical education, under Masset and Wartel. In 1864 she appeared at the Théâtre Lyrique of Paris, as Violetta in *La Traviata*, with such success that she was engaged for three years. She made her first appearance in London in 1867, where she immediately became a favorite. In 1868 she sang the

part of Ophelia in the opera *Hamlet*, by Ambroise Thomas, at the Grand Opéra in Paris. During the same year she sang in England at the Handel festival at the Crystal Palace. In 1870 she came to America, appearing in concerts and operas, and achieved popularity wherever she was heard. She was married in 1872 to Auguste Rouzaud, a merchant of Paris. After leaving Saint Petersburg, where she had been very successful, she returned to America with the Strakosch Italian opera troupe. She also sang Elsa in Wagner's *Lohengrin*. The death of her husband in 1882, after she had retired from the operatic stage, caused her to return to it, but her marriage to Count Miranda in 1887 brought about her permanent retirement in 1888. What her voice lacked in volume was compensated for in smoothness, sweetness, and evenness of tone.

NILSSON, nil'son, SVEN (1787-1883). A Swedish zoölogist and archæologist, born near Landskrona. At twenty-five he became assistant professor of natural history at Lund. He was appointed director of the Zoölogical Museum of that city in 1819, and returned there after four years in a like post at Stockholm. He resigned in 1856. Nilsson wrote, on Scandinavian fauna and antiquities: *Ornithologia Suecica* (1817-21); *Prodromus Ichthyologiae* (1832); *Observationes Ichthyologicae* (1835); *Skandinavisk fauna* (1820-53); and *Skandinaviska Nordens urindvånare* (1838-43; in German translation by Mestorf, 1863-68).

NIMBLE FLY. A fly of the family Dexiidae, a group allied to the parasitic family Tachinidae, so called from its rapid movements. Their legs are unusually long, and in their early stages they are parasitic in various insects, especially in beetles and also in snails. About fifty species inhabit North America.

NIMBUS. See CLOUD.

NIMBUS (Lat., cloud). In art, especially in sacred art, the name given to the disk or halo which enriches the head of the sacred personage who is represented. Its use is occasional in non-Christian religious art, especially the Hindu, and it was not unknown to classic and Oriental art. The nimbus, strictly so called, was first systematically used in Christian art, appearing first in the fifth century. Later, in Christian art, it became almost a necessary appendage of all representations of God or of the saints. It is of two kinds—either circumscribed by a well-defined outline, or radiating in vanishing lines. It took various forms. The square or oblong shape indicated a saintly person, such as a pope, still living, and was used mainly between the fifth and ninth centuries. The square form was symbolic of the material and earthly. The common form was the circular, symbolic of the spiritual and perfect. The earliest figure to receive the nimbus was that of Christ, and this nimbus almost immediately took a peculiar form, which was ordinarily given to Him up to the sixth century, and this was the monogram 

or  in the shape of a cross, called the Constantinian monogram (see LABARUM), formed of the first two letters of the Greek word for Christ, circumscribed in the circle and appearing above and on either side of His head. This became, after the sixth century, the ordinary cruciform

nimbus which was the rule up to the Renaissance, when the nimbus went out of fashion for all figures except occasionally in the form of a poised circlet or band. The interior of the nimbus, of whatever form, is gilt, either plain or in rays, excepting occasionally that of the Virgin, made of blue or some other color or starred. Up to the Renaissance the nimbus forms a circle against the background, but Renaissance artists tilted it or poised it naturalistically. God the Father was not represented until the late Middle Ages, and to Him was given a circular nimbus, but the Renaissance often gave it a triangular radiating shape. The dove of the Holy Ghost also had a circular nimbus. So had all duly canonized saints, for it was a symbol of the blessedness of eternal life in heaven. In later art the nimbus became lighter and more aerial, melting, as it were, into the picture; and in Raphael's saints it occasionally fades into the very faintest indication of a golden tinge around the head. Mosaic paintings, frescoes, illuminated manuscripts, and altar-pieces are the principal classes of monuments illustrating the use of the nimbus. See ICONOGRAPHY.

NIMEGUEN, nîm'e-gên (Dutch *Nijmegen*). A city in the Province of Gelderland, Holland, on the Waal, four miles from the German frontier (Map: Netherlands, D 3). It is situated on several hills, has the form of an amphitheatre, and is, for the most part, poorly built, with steep and narrow streets. The town is strongly fortified and garrisoned. Among the noteworthy edifices are the Church of Saint Stephen, a handsome Gothic structure dating from the thirteenth century, and the town hall, with a museum of Roman antiquities. In the beautiful Valkhof Park are ruins of an ancient Imperial palace. Nimeguen is a large market for cattle and agricultural products, especially grain and wine. It is noted for its Weissbier and its eau de cologne, and has manufactures of flour, cigars, tin, and other metal ware, leather, and furniture. Population, in 1895, 37,008; in 1900, 42,756, chiefly Catholics.

Nimeguen was founded by the Romans, who made it a permanent camp, in order to keep in subjection the Teutonic tribes northeast of the Rhine. In the Middle Ages it was a member of the Hanseatic League. It was taken by the Spaniards in 1585, but was recovered six years later. The Peace of Nimeguen in 1678-79 brought to a close the war between France and the Dutch and their allies, initiated by Louis XIV.'s invasion of the Netherlands in 1672. Peace between France and Holland was concluded on August 11, 1678; between France and Spain on September 17, 1678; between France and the Emperor on February 5, 1679; and between Holland and Sweden, the ally of France, on October 12, 1679. France secured possession of Franche-Comté and a portion of Flanders. The Peace of Nimeguen was the culminating point in Louis XIV.'s career and made France the leading power of Europe.

NÎMES, nêm. The capital of the Department of Gard, France, in Lower Languedoc, situated on a fertile plain at the southern base of a range of outlying hills of the Cévennes. 174 miles south-southwest of Lyons (Map: France, L 8). The climate of Nîmes is not particularly agreeable, owing to its winds and dust storms, and to its heat in summer. It is a unique city in that it contains very ancient constructions side by side with modern and handsome buildings,

streets, etc. It has splendid monuments of Roman times, and its antiquities are of almost every description. The fine Esplanade, approached by the spacious Avenue Feuchères, and flanked by the immense Roman amphitheatre, and adorned by a magnificent fountain decorated with statues by Pradier, forms a centre of striking interest. Here also are found the modern Palace of Justice, and a statue to Soleillet, the French explorer. The amphitheatre—Les Arènes—is an ellipse 438 feet long, and while smaller than the famous ones of Italy, is in a better state of preservation. Its construction is interesting. It was built at the beginning of our era and was capable of seating 24,000. Its restoration was begun in 1858.

The most striking structure in Nîmes is the far-famed Maison-Carrée, an imposing Roman temple, well preserved. It is 76 feet long and 40 feet wide, and is embellished with 30 Corinthian columns. The whole edifice is in excellent taste and possesses rich features. It is now thought to have been built early in our era. It evidently belonged in the ancient forum. After having served various degraded uses during the centuries, it was artistically restored in the eighteenth century. It contains a collection of Roman relics, some exhibiting a fine style of workmanship. Its Venus of Nîmes, however, is mediocre. The Romanesque Church of Saint Paul has splendid mural paintings by the two Flandrins. Nîmes has a Reformed Grand Temple of a very simple architectural style. The uninteresting cathedral was built of materials from ancient ruins. The Jardin de la Fontaine is a lovely garden, with a canal, cascades and basins, and a statue of Antoninus Pius, who was born in Nîmes. Among the Roman remains are the Tour Magne, 90 feet high, affording a fine view; a little Temple of Diana; and the Porte d'Auguste. The Hôtel-Dieu has an attractive façade. The Central Prison, with a capacity for 1400 persons, was an ancient citadel.

The Ecole des Beaux-Arts is modern. The city library has 75,000 volumes. This collection is installed in a former Jesuit college which has been provided with a handsome modern façade. The Maison-Carrée contains an archaeological museum. In the picture gallery in the southern part of the town are some creditable paintings. Nîmes has a Calvinistic consistory, a lyceum, a Protestant normal school for women, a Catholic seminary for priests, and industrial and art schools. The manufacturing industries are still important, though declining. Silk, wine, liquors, are extensively produced and dealt in. Nîmes also manufactures upholstery, shawls, lace, handkerchiefs, carpets, leather, and iron products. Population, in 1901, 80,605, nearly one-fourth being of the Reformed faith.

Nîmes (Lat. *Nemausus*) was the leading Roman colony in Gaul after B.C. 120, and was a provincial city of true magnificence. It fell under the scourge of the Vandals in A.D. 407, and was plundered by the Northmen in 859. It turned Calvinist at the Reformation and entered upon a troubled career. After the fall of Napoleon its citizens—or the *Bandes Verdets*—persecuted the Protestants. Guizot and Daudet were born there. The beautiful ruined Pont du Gard is northeast of Nîmes. Consult: Pieyre, *Histoire de la ville de Nîmes, depuis 1830 jusqu'à nos jours*.

(Nîmes, 1886-88); Bazin, *Nîmes gallo-romain* (Paris, 1891).

NIMRAVUS (Neo-Lat., from *Nimr*-od + Lat. *avus*, ancestor). A fossil cat found in the John Day Miocene beds of Western North America. See **SABRE-TOOTHED TIGER**.

NIMROD (Heb. *Nimrôd*). According to Gen. x. 8 seq. (I. Chron. i. 10), the founder of the Babylonian, and later of the Assyrian Empire; also "a mighty hunter before Jehovah." No explanation of the name and legend has as yet received common assent. The mythical theory which found in Nimrod Orion or the sun is now generally abandoned; and the dispute lies between a mythological and an historical personage. (1) According to the mythological view, Nimrod is identified either with the Babylonian god Marduk, a theory which would well explain his name, through the correspondence of three radicals (see **NISROCH**), or he is identified with Gilgamesh (q.v.), the hero of the Babylonian epic, who appears typically in art as engaged in combat with a wild beast, and is associated with Erech, one of Nimrod's cities. (2) Advocates of the historical view seek, by reason of the exact historical details, a character in Babylonian annals whose name may be the original of Nimrod. Such a person is suggested in a certain Kassite King of Babylonia of the fourteenth century B.C., Nazi-marattash (the latter component being supposed to be a god of hunting). But at present under any theory the legend must be regarded as made up of several sources. Yet, while the name is a problem, the biblical reference is of great interest as giving a correct tradition of early Babylonian history. Cush, the father of Nimrod, is now identified with the Kassites, an Elamitic race, which ruled Babylonia for the greater part of the second millennium B.C. (See **KASSITES**.) The four cities of Nimrod's kingdom mentioned in Genesis x. 10 are ancient and famous. That "out of that land he went forth into Assyria [the proper translation], and built Nineveh," etc. (Gen. x. 11-12), corresponds with the facts of the ethnical and social origin of Assyria from Babylonia. Of the four cities here mentioned, Rehoboth and Resen are not yet identified. In Micah v. 6, "the land of Nimrod" is in parallelism to "the land of Assyria." The characterization of Nimrod as a huntsman (an ancient and doubtless pre-Israelite saying), would be appropriate to a mythological character or to many an Oriental monarch. The mythological expression "a mighty hunter before Jehovah" would mean that Nimrod attracted the attention of the deities by his prowess, or even rivaled them in the art of hunting. Consult: Maspero, *Dawn of Civilization* (London, 1894); Sayce, *Patriarchal Palestine* (London, 1895).

NIMRUD. The modern name of a mound on the east bank of the Tigris, about 20 miles below Mosul (Map: Turkey in Asia, K 4), marking the ruins of an ancient Assyrian city identical with Calah (q.v.) mentioned in Gen. x. 11. It is one of a group of cities which clustered around Nineveh and may be regarded as a suburb of the latter. The chief discoveries were made at Nimrud by Layard in 1845-47 and 1849-51, though there were also later excavations by George Smith and Rassam. The city was a quadrangle about five miles in circumference, surrounded by a wall

VOL. XIV.—37.

with towers. The most important buildings discovered were: (1) a stage-tower (*sikkurra*) at the northwest corner of the mound; (2) temples near the tower, in which valuable inscriptions were found; (3) the so-called northwest palace built by Assurnazirpal (B.C. 885-860), and restored by Sargon (B.C. 722-705), 350 feet square; the sculptures found here were particularly fine and instructive, and there was a rich harvest of small objects of art, utensils of daily life, tools, armor, and the like; (4) the centre palace (of Shalmaneser II., B.C. 860-825, rebuilt by Tiglath-pileser III., B.C. 745-727); here was found one of the most interesting of all Assyriological monuments—the famous black obelisk of Shalmaneser II., now in the British Museum, which gives an account of the campaigns of the King during thirty-one years of his reign; (5) the southwest palace (Esarhaddon's, B.C. 681-668), built with materials taken from the northwest and centre palaces; (6) the southeast palace (Asshuretililani's, after B.C. 625); (7) a temple of Nebo, at first wrongly called the tomb of Sardanapalus. The history of Calah has been traced back to Shalmaneser I. (c.1300 B.C.), who calls himself its builder. It was afterwards neglected for a time, but was rebuilt by Assurnazirpal and was the capital of the Empire for two centuries. About B.C. 700 it gave way to Nineveh, and was destroyed by the Medes and Babylonians when they conquered Assyria. For bibliography, see **NINEVEH**; see also **ASSYRIA**; **ASSYRIAN ART**.

NIMWEGEN, nîm'wâ-gen. A city of the Netherlands. See **NIMEGUEN**.

NINDE, nînd, WILLIAM XAVIER (1832-1901). A bishop of the Methodist Episcopal Church. He was born at Cortland, N. Y., and graduated from Wesleyan University, Middletown, Conn., in 1855. After teaching for a year at Rome, N. Y., he entered the ministry. In 1861 he was sent to a church in Cincinnati, Ohio, and remained a pastor in that city until 1868, when he went abroad for travel through Europe and the East. The remainder of his pastoral life was spent in Detroit at the Central Methodist Episcopal Church. His terms here were divided by a period spent as professor of practical theology in Garrett Biblical Institute at Evanston, Ill. This institution called him to its presidency in 1879, and here he remained until 1884, when he was chosen a bishop of the Methodist Episcopal Church. He was one of the organizers of the Epworth League and its second president. He died at Detroit, Mich. Consult the memoir by his daughter (New York, 1902).

NINDEMANN, nîn'de-mân, WILHELM FRIEDRICH CARL (1850—). A German-American Arctic explorer, born at Gingst, island of Rügen. When seventeen, he came to the United States. He joined the *Polaris* expedition, and in 1872, when the vessel was caught in the ice, with eighteen of the crew he was carried on an ice field for nearly seven months. He was rescued off Labrador by the *Tigress*; volunteered on that vessel and afterwards on the *Jeannette* in the search for the *Polaris*; and after the loss of the *Jeannette* was sent south for help by De Long, in the quest for whom he later joined. Nindemann wrote in German a description of his Arctic voyages (1885).

NINE-EYES. In England, a lamprey (q.v.).

NINEKILLER. One of several similar names applied to shrikes, this one expressing a German rustic notion that the bird murders nine victims in a series. Compare BUTCHER-BIRD.

NINETY-SIX. A village in Abbeville County, S. C., about 80 miles southwest of Camden, said to have been so named from its having been located 96 miles from Keowee, the principal town of the Cherokees. During the Revolutionary War, it was an important strategic point, and in 1781, while occupied by a Loyalist force of about 550, under Lieutenant-Colonel Cruger, was unsuccessfully besieged by a force of Americans, under General Greene, from May 21st to June 19th, when, on receiving news of the near approach of a greatly superior British force under Lord Rawdon, General Greene withdrew. The loss of the Americans, incurred chiefly during an assault on June 18th, was about 185 in killed and wounded; that of the Loyalists was about 85. On June 29th the place was evacuated by Lord Rawdon. Consult Dawson, *Battles of the United States* (New York, 1858).

NINEVEH. The later capital of the great Assyrian Empire. The etymology of the name (written *Ninua* and *Ninā* in cuneiform inscriptions) is unknown. A popular etymology connected it with *nānu*, 'fish,' and made Nineveh the 'fish-city.' Presumably the word is connected in some way with *Ninā*, a Babylonian goddess, subsequently identified with Ishtar (q.v.). Nineveh was situated on the east bank of the Tigris, opposite the present Mosul (Map: Turkey in Asia, K 4), where for centuries its ruins were indicated by a number of mounds, the two principal ones being known as Koyunjik and Nebi Yunus, the latter the traditional site of the preaching of the prophet Jonah and crowned by a famous Mohammedan shrine. References in Arabic geographers and early European travelers show that the location was always preserved in local tradition, although the value of this tradition was called in question in the eighteenth century. Its trustworthiness was established by Claudius James Rich, whose examination of the mounds in 1821 marks the beginning of scientific investigation; he gave the first accurate description and prepared excellent maps (published, after his death, in 1836). The first excavations were made at Koyunjik by Paul Botta in 1842-43. At this early stage of Assyriological investigation sculptures or other large objects which could be sent to Europe and arouse popular wonder were the main desiderata; and when three months' labor had brought to light nothing but fragments of reliefs and inscriptions, Botta considered the work disappointing and abandoned Koyunjik for Khorsabad (q.v.). Layard, while excavating at Nimrud (q.v.) in 1845-47, dug a few trenches at Koyunjik and made a tentative examination which located the so-called southwest palace (Sennacherib's). During his second expedition (1849-51) he made a more thorough examination of this palace, brought to light numerous valuable sculptures, and discovered the famous library of Assurbanipal. After Layard's departure operations were continued by Rassam (1852-54), while Victor Place was also attempting to excavate at the same mound, the work of the two investigators not always proceeding in a spirit of friendly coöperation. Rassam discovered the north palace (Assurbanipal's), the sculp-

tures of which belong to the finest specimens of Assyrian art. He also found here the second half of Assurbanipal's library, including the Babylonian account of the deluge. The examination of the palace was continued for a short time after Rassam's departure by Loftus and Bouché. The next attempt at Koyunjik was made by George Smith during two brief periods aggregating not more than three months together in 1873-74, and resulted mainly in the recovery of inscriptions from Assurbanipal's library, popularly considered disappointing after the brilliant successes of Layard and Rassam, but in reality as important as any discoveries yet made. Rassam, during his four campaigns in 1878-82, made further excavations at Koyunjik; owing to the unfortunate attempt to do too much and the unsystematic and unscholarly methods followed, the results were not all that could have been desired. Rassam also excavated at this time at Balawat (q.v.), about fifteen miles east of Mosul, like Khorsabad and Nimrud one of the many cities grouped around Nineveh, and attempted without success to examine Nebi Yunus. It is known that the latter mound contains memorials of Adadnirari III. (B.C. 812-783) and palaces of Sennacherib (B.C. 705-681) and Esarhaddon (B.C. 681-668), but this mound has not yet been examined. Much also still remains to be done at Koyunjik. The earliest explorations of Layard were carried on at the expense of Sir Stratford Canning and Layard himself; other investigations have been supported by the British Museum, where most of the antiquities discovered are now stored. Besides ornaments, seals, and similar small objects of great importance as works of art, colossal statues were found, and small bas-reliefs representing incidents of war, hunting scenes, sacrificial rites, religious processions, building operations, and other events of daily life. The inscriptions on clay cylinders, obelisks, slabs, statues, and tablets of stone and other material have furnished data for tracing the history of the Assyrian empire with considerable detail from about B.C. 1100 to the fall of Nineveh.

The ancient city was a strongly fortified town, an irregular trapezium in shape. The walls have been traced and found to have been about a mile and one-quarter in length on the north, something less than three miles on the east, about half a mile on the south, and two and one-half miles along the Tigris on the west. A remarkable gate was discovered by Layard near the centre of the northern wall; on the city side there were colossal man-headed bulls and winged human figures. The river Khosar flowed through the city from west to east, dividing it into two nearly equal parts. The superficial area was about 1800 acres. According to a statement of the Book of Jonah (iv. 11), the population when the city was at the height of its glory has been estimated at 600,000. This is probably too great. Commander Jones calculated in 1852 that the population of the city and suburbs cannot have exceeded 350,000, while the city itself may have been the home of about 175,000 souls. The statement that "Nineveh was an exceeding great city of three days' journey" (Jonah iii. 3) does not seem greatly exaggerated, if the suburbs be taken into account.

The first certain mention of Nineveh is in the code of Hammurabi—latter half of the twenty-

third century B.C. (See HAMMURABI.) The name occurs in certain Babylonian inscriptions which are at least 500 years older, but it is not certain that the reference is to the Assyrian capital. The earliest seat of the Assyrian rulers was at Asshur (Kileh Shergat, on the west bank of the Tigris, about 50 miles below Mosul). The seat of government was first transferred to Calah (Nimrud, q.v.). Shalmaneser I. (c.1300 B.C.), who calls himself the builder of the latter city, is known to have restored a temple of Ishtar at Nineveh, which is also mentioned in an inscription of Shamshiadad (c.1800 B.C.) and in the code of Hammurabi. From the time of Asshur-belkala (c.1090 B.C.) to the reign of Assurnazirpal (B.C. 885-860) Nineveh was the capital. The latter King returned to Calah, but in the days of Sennacherib (B.C. 705-681) Nineveh regained its position. Sennacherib's predecessor, Sargon II. (B.C. 722-705), seems to have given the preference to Khorsabad. Under Sennacherib and his successors Nineveh attained to its greatest prosperity and fame. It fell before the combined efforts of Medes and Babylonians, the Median King, Cyaxares (B.C. 625-585), entering into an alliance with the Babylonian King, Nabopolassar (B.C. 625-605), for the destruction of the Assyrian Empire. The last days of Nineveh are obscure. That the city held out for a considerable time by virtue of its strong fortifications is probable. The year of its fall is uncertain; a probable date is B.C. 607. According to tradition its King, Sinsharishkun, ended his life in the flames which consumed his capital. The destruction of the city was complete. Xenophon with the Ten Thousand Greeks passed by its site about two centuries later, and does not even mention its name. It is probable, however, that the 'great uninhabited cities' which he calls Mespila and Larissa (*Anab.* iii. 4, 7-12) were Koyunjik and Nebi Yunus, respectively.

BIBLIOGRAPHY. All that was known about Nineveh before the beginning of excavations may be found in Tuch, *Commentationes Geographicae de Nino Urbe* (Leipzig, 1845), and Marcus von Niebuhr, *Geschichte Assurs und Babels* (Berlin, 1857). The authoritative accounts of the excavations are: Layard, *Nineveh and Its Remains* (London, 1848); id., *The Monuments of Nineveh*, series i., 100 plates, series ii., 71 plates (ib., 1849-53); id., *Discoveries in the Ruins of Nineveh and Babylon* (ib., 1853); Smith, *Assyrian Discoveries* (ib., 1875; 3d ed., New York, 1876); Rassam, *Asshur and the Land of Nimrod* (Cincinnati, 1897). For the topography, consult Rich, *Narrative of a Residence in Koordistan and on the Site of Ancient Nineveh* (London, 1836); Jones, "Topography of Nineveh, with Maps," in the *Journal of the Royal Asiatic Society*, vol. xv. (London, 1855). For the inscriptions consult Layard, *Inscriptions in the Cuneiform Character from Assyrian Monuments* (London, 1851); Rawlinson and Pinches, *The Cuneiform Inscriptions of Western Asia* (ib., 1861-91); Bezold, *Catalogue of the Cuneiform Tablets in the Koyunjik Collection of the British Museum* (ib., 1889-99). The following works are also recommended: Rich, *Collected Memoirs* (London, 1839); Loftus, *Travels and Researches in Chaldaea and Susiana* (ib., 1857); Layard, *Early Adventures in Persia, Susiana, and Babylonia* (ib., 1887; 2d ed., abridged, 1894); the *British Museum Guide to the Assyrian Antiquities* (new ed., ib., 1900); vol. i., parts

1-3 of the photographs of the antiquities in the British Museum published by Stephen Thompson (ib., 1872); Maspero, *The Struggle of the Nations* (ib., 1896) and *The Passing of the Empires* (ib., 1900), both profusely illustrated; Billerbeck and Jeremias, "Der Untergang Ninevhs und die Weissagungsschrift des Nahum von Elkoseh," in *Beiträge zur Assyriologie*, vol. iii. (Leipzig, 1898), a description of the defenses and fortifications with maps and illustrations; Kaulen *Assyrien und Babylonien* (5th ed., Freiburg, 1899); Goodspeed, *A History of the Babylonians and Assyrians* (New York, 1903); Schrader, *Die Keilschriften und das alte Testament* (Giessen, 1883; Eng. trans., London, 1897); Pinches, *The Old Testament in the Light of the Historical Records and Legends of Assyria and Babylonia* (London, 1902); Hilprecht, *Explorations in Bible Lands During the Nineteenth Century* (Philadelphia, 1903); and the works mentioned in the article ASSYRIA. See also ASSYRIAN ART; CUNEIFORM INSCRIPTIONS, and the biographical notices of the different excavators.

NINE WORTHIES, THE. Nine heroes of history and romance, long popular in mediæval art and story. They are mentioned in the preface to Caxton's *Malory's Morte d'Arthur*, as the "Nine Worthly and the best that ever were;" to wit, three Paynims, three Jews, and three Christian men. These are Hector of Troy, Alexander the Great, Julius Cæsar, Joshua, David, Judas Maccabæus, King Arthur, Charlemagne, and Godfrey of Bouillon. These heroes were a familiar and popular subject in tapestries and paintings, and figured also in masks and pageants. Dunlop mentions in *History of Prose Fiction* a rare romance, the "Triumphes des neuf Preux," in which the author had a vision of the nine worthies. Brunet intimates that the original was of Spanish origin. The nine are mentioned also in English literature. Shakespeare parodies them in *Love's Labor's Lost*, and Dryden alludes to them in *The Flower and the Leaf*.

NING-PO, ning'pō' (Chin., Calm Waves). A treaty port in the Province of Che-kiang, China, on the river Tatsish, 12 miles from the sea (Map: China, F 6). The inclosed space is about five miles in circumference. The brick walls, 25 feet high and 22 feet thick at the base, are pierced by six gates. The city is famous for its temples, pagoda, stone bridges, and a library, the fourth in point of number of volumes in the Empire. The gold and silver work, confectionery, lacquer work, and carving are noted all over China. The Portuguese settled in Ning-po, but were driven out in 1545 after a massacre, in which 800 out of 1200 Europeans were slain. The city was occupied by the British forces for six months in 1841-42, and was opened to foreign trade in 1842. It is an important centre of Christian missions. Ning-po has little direct trade and is principally a distributing station for Shanghai. Its total trade, chiefly imports, amounted in 1900 to more than \$10,000,000. The principal articles of commerce are green tea, cotton, opium, silk, and sugar. Population, estimated at 255,000.

NIN'IAN, SAINT. The Apostle of the Picts. He lived in the latter half of the fourth and the beginning of the fifth century. Whether Christianity had been introduced among the Picts before the time of Ninian has been a subject of

controversy. However this may be, it is certain that when Ninian appeared among them, the Picts were in the main a pagan people. He was a Briton, and of noble birth, but had been educated at Rome, and there ordained a bishop in 394. The exact time of his preaching in Scotland is unknown. His labors appear to have commenced in Cumbria, and to have extended over the greater part of the district as far north as the Grampian Hills, his see being fixed at Candida Casa, or Whithorn, in the modern Wigtonshire. His death is placed by the Bollandists in 432; his festival is September 16th. His *Life*, by Ailred, is in Forbes, *Historians of Scotland*, vol. v. (Edinburgh, 1874).

NINIGRET (c.1610-c.1677). A sachem of an Algonquian tribe of Indians, the Niantics. He assisted the English colonists in the Pequot war of 1637, but soon afterwards began to scheme for their expulsion or extermination. A visit to the Dutch on Manhattan Island in 1652-53 caused him to be suspected of plotting against the United Colonies, whose commissioners, in April, 1653, declared war against him, but were unable to prosecute it, owing to the opposition of Massachusetts. Ninigret, however, soon attacked the Long Island Indians, allies of the English, and the commissioners, after summoning him in vain to Hartford, sent Major Samuel Willard against him with a force of 310 men. Ninigret took refuge in a swamp, but subsequently (1662), in conjunction with several other chiefs, sold a large part of his territory to the colonists. Several of his successors from whom land titles were secured by Rhode Island were also called Ninigret.

NIÑO, nē'nyō, PEDRO ALONSO (c.1455-c.1505). A Spanish navigator, born at Moguer. He had sailed to the west coast of Africa several times in Portuguese vessels before 1492, when he became pilot of one of Columbus's three ships. In June, 1496, Niño sailed to Santo Domingo with supplies, and on his return nearly ruined the fortunes of Columbus by his braggadocio and his tardiness in reporting at court. After sailing on Columbus's third voyage, he planned with Cristóbal de la Guerra, a Spanish merchant, the first successful commercial voyage to the New World (1499). Niño died soon after his return, after having been accused of cheating the Crown of a part of its share in the profits of the voyage.

NINON DE L'ENCLOS, nē'nōn de lān'-klō', or LENCLOS (1616-1706). A Parisian courtesan, remarkable for beauty, grace, and intellectual culture, as well as for keen wit. Her career began at sixteen. Among her many lovers were successively the Count de Châtillon, the Marquis de Villars, the Marquis de Sévigné, the Marquis de Gersay, Marshal Condé, the Duc de la Rochefoucauld, Marshal d'Albret, Marshal d'Estrées, Abbé d'Effiat, Gourville, and La Châtre. She counted among her friends Queen Christina of Sweden, Madame Scarron (afterwards Madame de Maintenon), and Madame de La Fayette. Her salon seemed for a time a rival of the Hôtel de Rambouillet. Molière and Scarron are said to have taken literary counsel with her. Her beauty lasted into old age. Consult: Drouxmesnil, *Mémoires* (Rotterdam, 1752); and the *Works* of Saint-Evremond (Amsterdam, 1706), but especially the contemporary 'portrait' in Mlle. de Scudéry's *Clélie* (Paris, 1556-60), where she figures as 'Clarisse.'

NIOBE, nī'ō-bē (Lat., from Gk. *Niobē*). In Greek legend, the daughter of Tantalus, King of Lydia, and (according to the most popular version) the sister of Pelops. She was the wife of Amphion, King of Thebes, and bore him many children, the numbers varying usually between twelve and twenty. In her pride she boasted her superiority to Leto, the mother of Apollo and Artemis. The angry goddess moved her children to avenge the insult, and Apollo with his arrows slew the sons, while Artemis killed the daughters in the palace. Niobe in her grief prayed the gods, who in pity transformed her into a stone image on Mount Sipylus in Lydia. The story appears in the epic, and was retold by tragedians, poets, and chroniclers with many divergencies in detail. The fullest version which has survived is by Ovid (*Metam.*, vi. 146 sqq.). Representations of the story on vases and reliefs are not numerous, but it is the subject of one of the most famous groups of ancient statues. Consult: Stark, *Niobe und die Niobiden* (Leipzig, 1863); Ame-lung, *Führer durch die Antiken in Florenz* (Munich, 1897).

NIOBIUM (Neo-Lat., from Lat. *Niobe*, daughter of Tantalus; so called from its close resemblance to the metal tantalum, from Lat. *Tantalus*, father of Niobe). A metallic chemical element, same as columbium (q.v.).

NIOBRARA, nī'ō-brā'rā. A river rising in Laramie County, Wyo., flowing east through northern Nebraska, and emptying into the Missouri River at Niobrara, after a course of about 450 miles (Map: Nebraska; C 1). It is a shallow and rapid stream, and is not navigable. In its upper course it flows through a sandy region, after which it traverses a deep, rocky cañon; but in the lower part it winds through fertile bottom lands.

NIOBRARA STAGE. The name given to a division of the Cretaceous system (q.v.). The rocks, including sandstones, limestones, and chalks, are exposed in Kansas, South Dakota, and in the States farther westward, and attain a maximum thickness of 2000 feet.

NIORT, nyōr. The capital of the Department of Deux-Sèvres, France, on the Sèvre-Niortaise River, 49 miles by rail southwest of Poitiers (Map: France, F 5). Its chief points of interest are the Church of Notre Dame, with its famous tower and elaborate interior, the Church of Saint Andrew, Museum of Art and Natural History, Museum of Antiquities and the Public Garden. The inhabitants of the adjoining region are engaged in cattle-raising and farming, and the town has a large trade in gloves, oil, brushes, and leather; there are also extensive nursery interests. Niort dates from 1155; was under the rule of England for a short period; and as a Protestant stronghold endured many hardships during the Religious Wars. Madame de Maintenon was a native of Niort. Population, in 1901, 23,897.

NIPA (Neo-Lat., from the native name). A genus of plants referred by most botanists to the order Palmæ. *Nipa fruticans*, the only species recognized, common in the East Indian Archipelago, is a low-growing tree, which flourishes with the mangrove in places inundated by the tide. It abounds in saccharine sap, from which a kind of palm wine and also excellent sugar are made. The leaves are employed for roofing

and are exported from Tenasserim for this purpose.

NIPHER, FRANCIS EUGENE (1847—). An American electrical engineer and physicist. He was born at Port Byron, N. Y.; graduated from Iowa State University in 1870; and, after four years as instructor of physics in that institution, was chosen professor of physics and of electrical engineering in Washington University. Nipher organized the Missouri weather service (1877) and the Magnetic Survey of the State (1878); became a prominent member of the Saint Louis Academy of Science; and contributed to its *Transactions* articles on physics and meteorology. His more interesting researches include his proof that a photographic plate over-exposed may be developed as a positive, and that between positive and negative there is a zero value which cannot be developed.

NIPIGON, nip'i-gôn (or **NEPIGON**), LAKE. A lake of Ontario, Canada, 35 miles north of Lake Superior (Map: Ontario, M 8). It is about 60 miles long from north to south, and 45 miles wide. A coast line with bold headlands and deep bays gives a total length of shore of 580 miles. It is 813 feet above Lake Superior. A great number of mountain streams flow into it, and its waters flow out through the Nipigon River, 40 miles in length, southward, to Nipigon Bay, an arm of Lake Superior. The lake is very deep, studded with islands, and well stocked with fish.

NIPISSING, nip'is-sing (still-water place, or little-water place). An Algonquian tribe, formerly residing about the lake of the same name in Northern Ontario, Canada. When first known to the French, early in the seventeenth century, they were one of the most prominent and influential tribes of Canada, and were regarded by the Jesuit missionaries as the typical Algonquian tribe, and their language as the standard for the whole linguistic stock. On the destruction of the missions by the Iroquois about 1650 they were forced to fly to the north and west, almost to the extreme western end of Lake Superior. They afterwards returned and settled, some in their old country on the lake shores, others at the Three Rivers, and also with the Catholic Iroquois at the Lake of Two Mountains, near Montreal, where they still have a village. It is impossible to give any reliable statement of the past or present number of the Nipissing, as they are generally included in the estimates with the other tribes known collectively as Algonquian (q.v.). The Indians now on a reservation on Lake Nipissing are officially classed as Ojibwa (q.v.).

NIPISSING (or **NEPISSING**), LAKE. A lake in Ontario, Canada, nearly midway between Lake Huron and the Ottawa River, with a length of about 55 miles, and a maximum breadth of 28 miles (Map: Ontario, D 1). Its waters are mostly received from the north through Sturgeon River, which connects it with a chain of smaller lakes. The only outlet is French River, by which the lake discharges into Georgian Bay, an inlet of Lake Huron. There are a number of small islands. The vicinity is inhabited by Indians. There is a regular steamer service on the lake, and its waters and shores are extensively resorted to for angling and

shooting. Le Caron, a Récollet priest, was the first European to visit the lake, in 1614.

NIPMUC (fresh-water people). A collective term for the small inland tribes of Algonquian stock formerly living in central Massachusetts and the adjacent sections of Connecticut and Rhode Island. Their chief seats were at the headwaters of the Blackstone and the Quinebaug rivers, and about the ponds of Brookfield. Their villages had no apparent political connection, and the various bands were subject to their more powerful neighbors, the Massachusetts, the Wampanoag, the Narraganset, and the Mohegan, or even tributary to the distant Mohawk. There were seven villages of "praying Indians" among them in 1674, but on the outbreak of King Philip's War the next year almost all of them joined the hostiles, and at its close some of them fled to Canada or westward to the Mohican, and others to the districts about the Hudson.

NIPPER, SUSAN. A character in Dickens's novel *Dombey and Son*, the nurse of Florence Dombey, sharp-tongued but faithful.

NIPPERDEY, nip'për-di, KARL LUDWIG (1821-75). A German philologist, born in Schwerin, September 13, 1821. He studied at the universities of Leipzig and Berlin, and after teaching in the former university, became professor at Jena, 1852. He published a number of translations and critical studies of Latin prose, among them works on Cæsar, Nepos, and the *Annales* of Tacitus. These works passed through many editions, the translation of Nepos having reached its tenth edition in 1896, and the translation of the *Annales* of Tacitus, with exegetical notes, having passed through the ninth edition in 1892. Consult Schöll's collection of his works, under the title of *C. Nipperdei Opuscula* (1877), and the biography by the same author (1875). Nipperdey committed suicide, January 2, 1875.

NIPPLES. See BREAST.

NIPPOLD, ni'pôlt, FRIEDRICH (1838—). A German Church historian. He was born at Emmerich and studied at Halle and Bonn. After 1865 he served as professor of Church history at the universities of Heidelberg, Bern, and Jena. Nippold became a representative of liberal theology, and took a prominent lead in the modern Church movement. His numerous theological treatises include *Handbuch der neuesten Kirchengeschichte* (1857), which is his chief work, and *Amerikanische Kirchengeschichte* (1892).

NIPPON, or **NIHON**, né'hôn'. The Japanese pronunciation of the name "Jih-pen" (sun-origin) given to 'Japan' by the Chinese. 'Japan' is a corruption of the same words. The name was employed first officially by the Japanese Government about A.D. 670. Before that time various high-sounding titles had been used, and two native names still survive in literature, 'Yamato,' strictly speaking, the name of a province, and 'O-mi-kuni' (Great August Country). 'Nippon' was misapplied by Occidentals for a time as the name of the largest island of the archipelago.

NIPPUR (modern name, NUFFAR). One of the most important cities of ancient Babylonia, situated on the northeast edge of the district now occupied by the Afej tribes of Arabs, be-

tween the Tigris and the Euphrates, about 100 miles southeast of Bagdad. The Talmud identifies it with Calneh (Gen. x. 10). Nippur was famous as the seat of worship of the god Bel (or En-lil), who at an early period acquired a unique position as the chief deity of the Babylonian Pantheon. This is indicated by his name, which signifies 'lord' par excellence. The close connection in ancient Babylonia between political supremacy and religious prominence justifies the supposition that for a considerable period Nippur, the city of Bel, also exercised control over at least a large portion of the Euphrates Valley. The religious sanctity of the place, however, outlasted its political history, and for many centuries after Nippur had yielded its political supremacy to other centres it continued to be a favorite place of pilgrimage, and the kings of both Babylonia and Assyria vied in rendering homage to the great Bel by restoring ruined portions of his temple. The chief temple was known as Ekur, 'Mountain House,' and there was also a stage-tower (*zik-kurrat*), rising to a considerable height, with a shrine of Bel at the top. Besides Bel and his consort, Belit, other gods were worshiped at Nippur, and temples or shrines were erected to them, so that there came to be a large sacred complex, shut off from the rest of the city by a double wall.

Systematic explorations at Nippur have been conducted by the University of Pennsylvania, beginning in 1888 under the direction of the Rev. Dr. John P. Peters, the founder and organizer of the expedition, and continued at intervals till 1900. During 1893-96, and again in 1898-1900, the work was in charge of J. H. Haynes, who was joined in the field during the spring of 1900 by Prof. H. V. Hilprecht. As a result a considerable portion of the temple area and adjoining grounds has been laid bare, the character and plans of the ancient buildings have been determined, and a large number of inscriptions, historical and votive, as well as over 30,000 commercial and literary tablets, have been found. The larger number of the tablets were discovered in a section of the mound containing an edifice or edifices used for the legal and literary archives of the temple. Through the historical and votive inscriptions, of which two volumes have been published by Professor Hilprecht (*Old Babylonian Inscriptions, Chiefly from Nippur*, Philadelphia, 1893-96), the history of Nippur has been traced to a date, according to some, as early as c.4500 B.C., according to others to c.3200 or 3000 B.C. Much light has been shed on the general course of events from this early period down to the rule of the Kassites in Babylonia (c.1700-1200 B.C.), who appear to have been particularly attached to the cult of Bel of Nippur. A third volume by Professors Hilprecht and Clay (*Business Documents of Murašū. Sons of Nippur*, Philadelphia, 1898) consists of 120 tablets of a commercial character, illustrating business methods in Babylonia during the Persian period. Consult, besides the works already mentioned: Peters, *Nippur, or Explorations and Adventures on the Euphrates* (New York, 1897); Hilprecht, *Explorations in Bible Lands during the Nineteenth Century* (Philadelphia, 1903).

NIRGUA, nēr'gwā. A town of the State of Carabobo, Venezuela, 110 miles southwest of

Caracas (Map: Venezuela, D 2). It is situated in the richest district of the State, in a region producing coffee, cacao, sugar, tobacco, and cotton, as well as live stock. Nirgua was founded in 1554, and in 1565 rich gold deposits were discovered in the vicinity. The population of the municipality, in 1891, was 8394.

NIRUKTA, nē-rōōk'ta (Skt., explanation, from *nis*, out + *ukta*, p.p. of *vac*, to speak). The name of that one of the six *Vēdāṅgas* (see *VĒDĀNGA*) which explains difficult Vedic words. There must have been several works of this character in a remote period of Hindu antiquity, which bore the name *Nirukta*, for 'Nirukta authors' are quoted either generally or by name in several Sanskrit authors; but the work which is especially called *Nirukta*, and which, thus far, is the only surviving representative of this important division of the *Vedāṅgas*, is that of Yaska, who was a predecessor of Panini (q.v.). His work consists of three parts—the *Nāighaṇṭuka*, where, for the most part, synonymous words are given; the *Nāigama*, which contains words that usually occur in the Vedas only; and the *Dāivata*, which contains words chiefly relating to deities and sacrificial acts. A commentary on this work has been composed by the same Yaska, and it likewise bears the name of *Nirukta*. In this, Vedic passages are quoted in illustration of the words to be explained, and the comment given by Yaska on these passages is the oldest known instance of a Vedic gloss. Besides the great importance which Yaska's *Nirukta* thus possesses for a proper understanding of the Vedic texts, it is valuable also on account of several discussions which it raises on grammatical and other questions, and on account of the insight it affords into the scientific and religious conditions of its time. The text and commentary of the *Nirukta* have been edited by Roth (Göttingen, 1852), and by Samassami, *The Nirukta, with Commentaries* (Calcutta, 1882-91).

NIRVANA, nēr-vā'nā (Skt. *nirvāṇa*, extinction, from *nis*, out + *vāna*, a blowing, from *vā*, to blow). In Buddhistic doctrine, the term denoting final deliverance from transmigration. It implies, consequently, the last aim of Buddhism, since transmigration is tantamount to a relapse into the evils or miseries of *samsāra*, or the world. But as Hinduism, or the Brahmanical doctrine, professes to lead to the same end, the difference between *nirvāṇa* and *mōkṣa*, *apavarga*, or the other terms of Brahmanism designating eternal bliss, and consequent liberation from metempsychosis (q.v.), rests on the difference of the ideas which both doctrines connect with the condition of the individual after that liberation. According to the Brahmanical doctrine, man has a soul, and Brahma being the existing and everlasting cause of the universe, eternal happiness is to the Brahmanical Hindu the absorption of the soul into that cause whence it emanated, never to depart from it again. On the other hand, as the ultimate cause of the universe, according to Buddhism, is non-entity, the deliverance from transmigration is, to the Buddhists, the return to non-entity, or the absolute extinction of individuality. Buddhism acknowledges no soul. In Brahmanism the separate soul is reabsorbed into the All-soul. In Buddhism, individuality ceases. But to some Buddhists, as also to the Jains, nirvana became a term significant rather of emancipation, eter-

nal blissful repose. Further changes naturally followed. We are told, for instance, that nirvana is quietude and identity, whereas samsara is turmoil and variety; that nirvana is freedom from all conditions of existence, whereas samsara is birth, disease, decrepitude, and death, sin and pain, merit and demerit, virtue and vice; that nirvana is the shore of salvation for those who are in danger of being drowned in the sea of samsara; that it is the port ready to receive those who have escaped the dungeon of existence, the medicine which cures all diseases, and the water which quenches the thirst of all desires. To Buddha, who received the term from earlier Hinduism and did not invent it, nirvana meant, first of all, the extinction of desire, of anger, of ignorance. Whether it was also synonymous with annihilation he refused to state, although this may be inferred.

The later Buddhist interpretations show that it was impossible to retain the notion of a non-psyche individuality persisting after death, and that the goal of extinction steadily faded before the older and more permanent notion of eternal felicity in one form or another. The first of these later views is that which confounds with nirvana the preparatory labor of the mind to arrive at that end, and therefore assumes that nirvana is the extinction of mentality, or even of self-consciousness. The erroneousness of this view is based on the fact that the mind, even though in a state of unconsciousness, as when ceasing to think, or when speculating, is still within the pale of existence. Thus, to obviate the mistaken notion that such a state is the real nirvana, Buddhist works sometimes speak of the "nirvana without a remainder of substratum" in contradistinction to the "nirvana with a remainder;" meaning by the latter expression that condition of a saint which, in consequence of his bodily and mental austerities, immediately precedes his real nirvana, but in which, nevertheless, he is still an occupant of the material world.

The second heterodox view of nirvana is that which, though acknowledging in principle the original notion of Buddhist salvation, clearly represents a compromise with popular prejudice. It belongs to a still later period of Buddhism, when this religion, in extending its conquests over Asia, had to encounter creeds which abhorred the idea of an absolute nihilism. This compromise coincides with the creation of a Buddhist pantheon, and with the classification of Buddhist saints into three classes, each of which has its own nirvana; that of the two lower degrees consisting of a vast number of years, at the end of which, however, those saints are born again; while the absolute nirvana is reserved for the highest class of saints. Hence Buddhist salvation is then spoken of, either simply as *nirvāṇa*, the lowest, or as *parinirvāṇa*, the middle, or as *mahāparinirvāṇa*, final and absolute extinction of individuality; and as those who have not yet attained to the highest nirvana must live in the heavens of the two inferior classes of saints until they reappear in this world, their condition of nirvana is assimilated to that state of more or less material happiness which is also held out to the Brahmanical Hindu before he is completely absorbed into Brahma.

When, in its last stage, Buddhism assumes

an Adi, or primitive Buddha, as the career of the universe, nirvana, then meaning the absorption into this Buddha, ceases to have any real affinity with the original Buddhist term, and becomes identified with the *mōkṣa*, or salvation by absorption, of the pantheistic philosophers. See also **BUDDHISM** and **LAMAISM**. Consult: Oldenberg, *Buddha, His Life, His Doctrine, His Order* (London, 1882); Hopkins, *Religions of India* (Boston, 1895); Dahmann, *Nirvana, eine Studie zur Vorgeschichte des Buddhismus* (Berlin, 1896).

NI'SAN. In the Jewish calendar, the first month of the ecclesiastical year. See **ABIB**.

NISARD, né-zär', Désiré (1806-88). A French literary critic and historian, born at Châtillon-sur-Seine, Côte-d'Or. Nisard began literary life as a liberal journalist. He supported the July Monarchy after a brief period of vigorous radicalism as editor of *Le National* and fellow-worker of Armand Carrel. In 1835 he was made Supervisor of Normal Schools, and, with official promotions, grew yearly more conservative and even reactionary. From 1842 to 1848 he was Deputy, and, after temporary eclipse at the Revolution of 1848, recovered under Napoleon III. favor and office, which he used so servilely, in lecturing at the Collège de France, as to provoke student riots and require police protection (1855). In recompense for this he was made Commander of the Legion of Honor (1856), Director of the Normal School (1857), and Senator (1867). He had belonged to the Academy since 1850. His more noteworthy works are *Histoire de la littérature française* (1844-61); *Etudes* (1859); and *Nouvelles études* (1864). As critic he stands for classic as opposed to romantic ideals. He neglects the Middle Ages and the Renaissance, and regrets alike the perversity of the eighteenth century and the degeneracy of the nineteenth. His objective method and martinet spirit delighted only in the clear precision of the Classic School. Thus he is the opposite of Sainte-Beuve and the forerunner of Brunetière. Nisard died March 15, 1888, at San Remo. Consult his *Souvenirs et notes biographiques* (1888).

NISCEMI, né-shá'mé. A town in the Province of Caltanissetta, Sicily, 30 miles southeast by south of the city of Caltanissetta (Map: Italy, J 10). A ruined castle is the chief object of interest. In 1790 the town suffered from an earthquake, the ground sinking in one place to the depth of 30 feet. Population (commune), 1881, 11,962; 1901, 14,689.

NISH, nêsh, or **NISSA**, nîs'sá. The second city of Servia, situated on the Nishava, a tributary of the Morava, about 130 miles southeast of Belgrade (Map: Balkan Peninsula, D 3). It is fortified and divided into a Turkish and a Servian town. It is gradually assuming a European aspect. Its educational institutions include a gymnasium and a training school for teachers. Situated at the junction of the Vienna-Belgrade-Constantinople and the Nish-Saloni-ki railway lines, as well as at the converging point of several important roads, Nish is of great commercial and strategic importance. It was prior to 1901 the seat of the National Assembly. Population, in 1895, 21,524, including about 2000 Mohammedans.

Nish is the Niassus of the Romans, a prominent city, according to Ptolemy, and the birthplace of Constantine the Great. It fell in 1456 into the hands of the Turks, under whom it was an important stronghold. It was the scene of a severe defeat of the Servians by the Turks in 1809, and was captured by the Servians under Milan in 1878.

NISHAN EL-AAMAN, nī-shān' ēl ā-mān' (Ar. *nishān al-āman*, order of the best). A Tunisian order with one class founded by Mohammed-es-Sadok in 1859 in commemoration of the adoption of the Constitution.

NISHAN EL-IFTIKHAR, if'ti-kār' (Ar. *nishān al-iftihār*, order of honor). A Tunisian order of merit, civil and military, modeled on the French Legion of Honor, founded by Ahmed Bey. It has five classes. The decoration is a star with the Bey's monogram.

NISHAN EL-IFTIKHAR. A Turkish order, conferred on foreigners for services to the Turkish State. It was founded by Sultan Selim III. and renewed in 1827. The decoration is an ornate medallion with the Sultan's monogram suspended from the star and crescent.

NISHAN-I-IMTIAS, ē-ēm'tē-ās' (Ar.-Pers. *nishān-i-imtiyās*, order of excellence). A Turkish order of merit conferred on civil and military officials who have displayed at least three of the qualities the names of which appear on the decoration: patriotism, zeal, bravery, and fidelity. It was founded in 1879 by Sultan Abdul Hamid.

NISHAN-I-SHEFKAT, ē-shēf-kāt' (Ar.-Pers. *nishān-i-shifqat*, order of clemency). A Turkish order with three classes, conferred on women for services in war and in times of distress. It was founded by Sultan Abdul Hamid in 1878. The decoration is a sun with laurel wreath and star suspended from a crescent.

NISHAPUR, nīsh'ā-pūr'. A town of North-eastern Persia, in the Province of Khorasan (Map: Persia, G 3). It is situated in a fertile and populous plain 40 miles west of Meshed, and is surrounded by half-ruined walls. It was formerly one of the most important cities of Persia, but has greatly declined. It still has some trade in turquoises. Population, about 11,000. Nishapur was the birthplace of Omar Khayyam.

NISIBIS (Lat., from Gk. *Nisibis*). The capital of ancient Mygdonia, the northeastern part of Mesopotamia. It was situated in a fertile district, and was of importance, both as a place of strength and as an emporium of the trade between the East and the West. Nisibis is mentioned in the cuneiform inscriptions under the name Nasibina. It seems to have been rebuilt by Seleucus, and during the Macedonian rule was known as *Antiochia Mygdonia*. It was taken in B.C. 149 by the Parthians, and in their wars with Rome changed hands more than once, being captured by Lucullus (B.C. 68) and again by Trajan (A.D. 116). After its third capture by Lucius Verus, A.D. 165, it remained the chief bulwark of the Roman Empire against the Persians, till it was surrendered to them by Jovian after the death of Julian in 363. Nisibin is still the name of a Turkish village near the ruins of the ancient city.

NISI PRIUS (Lat., unless before). A term applied to certain trial courts, consisting of one judge and a jury, which have jurisdiction for

the trial of civil cases. The term originated in England through the practice of inserting in writs of venire (q.v.), by which jurors were summoned, a clause directing them to appear at the Court of Common Pleas at Westminster on a certain date, unless before (*nisi prius*) that time one of the judges in Eyre (circuit) should hold court in their county. It also became common, when cases from a distant county were commenced at Westminster, to fix a certain day on which they were to be tried unless before that time court was held in that county, and this was entered on the record, being known as the '*Nisi prius* clause.' This practice was sanctioned by the statute of 13 Edw. I., c. 30, known as the "Statute of *Nisi Prius*." The sessions held by these circuit judges came to be known as *Nisi Prius* Courts, and this continued until after the sittings of the judges became fixed and certain, when the alternative phrase was omitted from the venire; and thereafter the use of the term as applied to the courts was gradually discontinued. To-day the cases tried before the judges of the King's Bench Division of the High Court of Justice in London are known as *nisi prius* actions, and this seems to be the only use of the term which has judicial sanction in England at present, although in the country districts the name is still popularly applied to the proceedings in the civil courts held in the various circuits under the Judicature Acts (q.v.). In a few of the United States the term is applied to certain civil courts, the sessions of which are held by judges who travel from one county to another, in a fixed circuit of several counties, during the year; but the original significance of the term has become obsolete. See CIRCUIT; COURT; JUDICATURE ACTS, and consult the authorities there referred to.

NISQUALLI, nīz'kwā-lē. A Salishan tribe of North American Indians originally occupying the territory about the river of the same name at the southern end of Puget Sound, Washington. With the Puyallup (q.v.) and several smaller bands, all speaking dialects of the same language, they participated in the Medicine Creek Treaty of 1854 and were assigned to a reservation, but have recently been given industrial allotments and are now citizens. They subsisted chiefly upon wappato and camas roots, wild berries, and salmon. They lived in great communal houses of cedar planks and used cedar dugout canoes of elaborate workmanship and ornamentation. Slavery was a regular institution, and head-flattening was practiced, but not scalping. They buried their dead in canoes raised upon posts. They took part in the general Indian war in Washington in 1858. They number now only about 100 souls.

NIS'ROCH (Heb. *Nisrōk*). According to II. Kings xix. 37 (Is. xxxvii. 38), the god in whose temple Sennacherib was assassinated by his sons. No such god, however, has been discovered in the Assyrian pantheon, and the word is manifestly a corruption. It has been variously identified with Asshur, Nusku, and others, but most probably it represents Marduk, the chief of the later Babylonian pantheon. (See MEMODACH.) For a like corruption, see NIMROD. Consult Cheyne, *Sacred Books of the Old Testament* (London, 1896, et seq.).

NISSA, nīs'sā. A city of Servia. See NISH.

NISSEN, HEINRICH (1839—). A German archaeologist. He was born at Hadersleben, studied at Kiel and Berlin, and became professor of ancient history at Marburg (1869), Göttingen (1877), Strassburg (1879), and Bonn (1884). Nissen especially devoted himself to the critical study of early Roman history. He wrote *Kritische Untersuchungen über die Quellen der vierten und fünften Dekade des Livius* (1863), *Das Templum* (1869), *Pompejanische Studien* (1877), *Italische Landeskunde* (1883), and "Griechische und römische Metrologie" (1887) in Iwan Müller's *Handbuch der klassischen Altertumswissenschaft*.

NISUS (Lat., from Gk. *Nisos*, *Nisos*). (1) In Greek mythology, a King of Megara, and son of King Pandion of Athens. His daughter Scylla fell in love with Minos, King of Crete, when the latter, on his expedition against the Athenians, besieged Megara, and betrayed the city to him. She slew her father by cutting off a purple lock of hair, on the preservation of which his life depended, but Minos punished her treachery by dragging her after his ship and drowning her. She was changed into the bird called Ciris, in which form she was constantly pursued by Nisus, transformed into a sea-eagle. The legend is treated by Vergil in the *Ciris*, and by Ovid, *Met.*, viii. 145. (2) A companion of Æneas and friend of Euryalus, with whom he was slain in the war against Turnus.

NITHARD (c.795-843). A Frankish historian, son of Bertha, daughter of Charles the Great. He was a warrior and a statesman and sided with Charles the Bald in the quarrels between the sons of Louis the Pious. Nithard fought in the great three days' fight at Fontenoy in 841, and was killed two years after in a battle with the Northmen near Angoulême. His Latin history deals with the dissensions of the sons of Louis the Pious; it is valuable, but strongly partisan, and is remarkable as one of the few documents of the Middle Ages written by a layman. The work is edited by Pertz (*Hanover*, 2d ed., 1870). Consult: Pätz, *De Vita et Fide Nithardi* (Halle, 1865), and Meyer von Knonau, *Ueber Nithards vier Bücher Geschichte* (Leipzig, 1886).

NITHSDALE, nich'däl, WILLIAM MAXWELL, Earl of (1676-1744). A Scotch Jacobite, the Willie of 'Kenmure's up and awa'. He participated in the Jacobite rising of 1715. He was captured after Preston, and was rescued from the Tower by his wife, who took his place in prison while he escaped in her clothes. He made his way to Rome, where he joined the Pretender. The Countess of Nithsdale wrote the story of his escape published in the first volume of the *Transactions of the Societies of Antiquaries of Scotland*.

NITOCRIS. A Queen of Egypt (Nitaqert, or Nitaqrit), the last ruler of the Sixth Dynasty. She was sister of Menthuthopis, whom she succeeded, and whose murder she avenged by drowning all she suspected of connection with the plot, after having called them together for a feast. The third in size of the great pyramids was enlarged by Nitocris, and there she was buried. About her beauty legends grew up; the Greeks called her Rhodopis, translating the Egyptian epithet, red-cheeked; they argued she must have been a Greek, made her a courtesan, and told how the King married her, having

fallen in love with her lost slipper—the earliest form of the legend of Cinderella. Another legend in the Middle Ages makes her a beautiful spirit who haunts the pyramid and drives men mad for the love of her.

NITRATE OF SODA. See MANURES AND MANURING.

NITRATES. See NITRIC ACID.

NITRE. See SALTPETRE.

NITRIC ACID (from Neo-Lat. *nitrum*, nitre, natron, Lat. *nitrum*, from Gk. *nitron*, *nitron*, *litron*, natron, of Semitic origin, cf. Heb. *neter*, natron, from *netar*, to loose), HNO₃. A powerfully acid compound of hydrogen, nitrogen, and oxygen. Geber, in his *De Inventione Veritatis*, described a method of preparing the acid by heating potassium nitrate with alum and copper sulphate, and Glauber was probably the first to prepare it by the action of free sulphuric acid upon saltpetre (the acid was long known as '*spiritus nitri fumans Glauberi*'). In 1669 Mayow described nitric acid as containing two components, one from the air and one from the earth. In 1776 Lavoisier demonstrated that one of its constituents was oxygen, and in 1785 Cavendish showed the composition of the acid by synthesizing it from oxygen and nitrogen in the presence of water. However, the true composition of its molecule was not recognized until long afterwards, when chemists had realized that acids in general were compounds necessarily containing hydrogen. (See CHEMISTRY.) Nitric acid does not occur in a free state in nature, but after thunder storms traces of it are found in rain water, and according to Boussingault, amounts of nitric acid up to 0.66 mg. to the liter have been found in the rain falling on the Alps. It occurs largely, however, combined in the form of alkaline nitrates, in Chile and elsewhere, the formation of the nitrates being supposed to originate in the putrefaction of nitrogenous organic matters: the latter are assumed to be converted into ammonia, and this to be oxidized in presence of the hydroxide of potassium, sodium, or calcium, into the corresponding nitrate. Nitric acid may be made by the action of strong sulphuric acid on the nitrate of sodium or potassium, the former being generally employed on a commercial scale on account of its cheapness. Cast iron retorts are charged with about 670 pounds of dry sodium nitrate, about 530 pounds of strong sulphuric acid are added, and heat is applied. The volatile nitric acid, on forming, passes into a series of large bottles provided with inlet and outlet tubes ('Woulff's bottles') and containing small amounts of water. Nitric acid is, however, not the only product, a certain amount of peroxide of nitrogen being formed at the same time. Some of this dissolves in the nitric acid, imparting to it a more or less intense red coloration. Another portion of the peroxide is caused to come into contact with moist air, in a tower attached to the last of the large bottles, and thus this portion of the peroxide is converted into nitric acid. Sodium sulphate remains as a by-product of the process in the cast-iron retorts. The acid product generally contains about 55 per cent. of nitric acid, the rest being water and small amounts of chlorine, iodic acid, oxide of iron, sulphuric acid, sodium sulphate, and peroxide of nitrogen, the non-volatile of

these impurities being carried over mechanically during the process of distillation. Most of the impurities may be readily gotten rid of by a second distillation, the first portion of the distillate and a small last portion containing nearly all the impurities, while the large intermediate portion is practically pure, although it still contains a large percentage of water and a small amount of nitrogen peroxide. A third distillation, this time after mixing the liquid with an equal volume of concentrated sulphuric acid, yields a nitric acid of over 99.5 per cent. strength. To free this from peroxide of nitrogen, it is gently warmed, then removed from the source of heat, and a current of dry air is passed through it until the temperature has been reduced to that of the surroundings. Thus nitric acid is purified for use in chemical laboratories. For many purposes in the arts, however, the acid need be neither very strong nor very pure. Pure nitric acid is a colorless liquid with a specific gravity of 1.53 at ordinary temperatures. The pure acid, as well as its strong aqueous solutions, decomposes slowly under the influence of light, with formation of water, oxygen, and peroxide of nitrogen, the latter coloring the acid yellow. A similar decomposition, only more rapid, is effected by heat, at temperatures above 86° C. (187° F.). A given amount of nitric acid may be decomposed entirely by sealing it up in a glass tube and raising the temperature to 260° C. (500° F.). Under reduced pressures nitric acid may be distilled without decomposition; thus, it may be entirely freed from nitrous acid by several distillations under a pressure of 15 millimeters of mercury, at the temperature of 45° C. (113° F.).

Nitric acid is used in large quantities in chemical laboratories, in both analytical and synthetic work. Its uses in the manufactures are very extensive indeed. It is used in the manufacture of explosives, of coal-tar colors, and of commercial nitrates, including those of silver, lead, iron, aluminum, barium, and strontium. A mixture of nitric and hydrochloric acids is known as *aqua regia* (q.v.). Nitric acid is one of the most powerful oxidizing agents and in a concentrated state readily oxidizes sulphur, phosphorus, carbon, most metals, and many organic substances. The oxidation of turpentine, for example, when added to strong nitric acid, is rapid enough to be accompanied by an evolution of light and of heat of a very high temperature. The following may be mentioned among the *physiological effects* of nitric acid: the strong acid is a powerful caustic, staining the skin yellow and causing erosions and ulcers; even a 10 per cent. solution in water will cause swelling if applied to the skin. In highly dilute form the acid is sometimes administered internally, the effect being an improved appetite and an increased secretion of urine. If continued, however, the administration of the acid will cause the gums to turn spongy and to bleed, and will loosen the teeth. Whether given internally or employed in the form of baths, nitric acid will further cause dyspepsia, foul breath, headaches, debility, etc. It has been successfully given in cases of intermittent fever, to allay thirst in diabetes, and for a variety of other purposes. Externally it is used as an ingredient of gargles, in the treatment of chilblains, for the

removal of warts, etc. Aqua regia is sometimes used for the same purposes as nitric acid alone. For a convenient method of detecting nitric acid, see below under *Nitrates*.

NITRATES. The salts of nitric acid, i.e. the compounds resulting from the substitution of metals for the hydrogen of nitric acid, are termed nitrates. The most important of these is *nitrate of silver*, AgNO_3 , which is extensively used in photography and in medicine. It is made by dissolving metallic silver in gently heated 30 per cent. nitric acid, the pure salt crystallizing out on cooling. It may be purified by fusing, when the nitrates of other metals that are likely to be present are reduced and rendered insoluble, so that pure silver nitrate may be dissolved out of the fused mass on cooling. Silver nitrate is very soluble in water and dissolves in four times its weight of cold alcohol. It forms colorless tabular crystals of the rhombic system. It melts at 198° C. (388.4° F.) without decomposition; but if heated to redness it is reduced to metallic silver. Fused silver nitrate, usually in sticks rendered firm by the addition of a little potassium nitrate, or silver chloride, is used as a cauterizing agent, being commonly known as *lunar caustic*. When applied to the skin, silver nitrate combines with albumin to form an insoluble white albuminate of silver. When used, the sticks are moistened with water and rubbed over the surface of the skin. The nitrate is thus used in diphtheria, croup, chronic ulceration and simple inflammation of the larynx and trachea, simple chronic laryngitis, whooping cough, various forms of neuralgia, in various diseases of the eye, in erysipelas, for burns, etc. The stain left by it on the skin may be removed by the use of potassium cyanide. Internally nitrate of silver is sometimes given in certain diseases of the stomach and the heart and in bronchitis, and it has been found useful in certain diseases of the nervous system; for example, in paralysis and epilepsy. In cases of poisoning by silver nitrate, the patient should swallow a large amount of a solution of common salt, which transforms the nitrate into the insoluble and harmless silver chloride, and induces vomiting; the solution of salt should be followed by moderate amounts of milk. Nitrates of lead, iron, and aluminum are used in dyeing and calico printing. *Lead nitrate*, $\text{Pb}(\text{NO}_3)_2$, may be obtained by dissolving metallic lead, or oxide or carbonate of lead, in dilute nitric acid, the salt crystallizing out on slow evaporation. It is soluble in water, but is insoluble in strong alcohol. It is sometimes used in medicine, especially as an application for sore nipples. *Nitrate of iron*, or ferric nitrate, $\text{Fe}_2(\text{NO}_3)_6$, is likewise sometimes used in medicine, its solution being prepared by the action of nitric acid on freshly obtained moist ferric hydroxide. *Barium nitrate*, $\text{Ba}(\text{NO}_3)_2$, and *strontium nitrate*, $\text{Sr}(\text{NO}_3)_2$, are used in making fireworks. The nitrates of potassium and sodium will be found described under *SALTPETRE*. Nitric acid and its salts may be most readily detected in solutions by the use of the alkaloid brucine: a little brucine in solution and a few drops of strong sulphuric acid are added to the liquid under examination, which turns pink if it contains nitric acid or a nitrate. The nitrates also include a number of organic substances, the most important of which are nitroglycerin and gun-cotton (qq.v.). See also **NITROGEN**.

NITRIFICATION. The term applied to the formation of nitrates in soils and manures through the agency of micro-organisms. It includes three different stages, viz., (1) *ammonization*, the transformation of organic nitrogen compounds into ammonia; (2) *nitroization*, or the conversion of ammonia into nitrites; and (3) *nitration*, or the formation of nitrates from the nitrites. Modern investigation has shown that all three of these changes are due to the activity of micro-organisms, the first being brought about by a variety of organisms of the putrefactive class, the most prominent being *Bacillus mycoides* and *Proteus vulgaris*, while the second and third are the work of specific organisms (*nitrosomas*, nitrous organisms, and *nitrobacteria*, nitric organisms), which have been isolated and studied with some minuteness. The retrograde action known as denitrification, by which nitrates are reduced to the less highly oxidized forms and even to free nitrogen, has also been shown to be the work of micro-organisms, mainly *Bacillus denitrificans* I. and II., although a large number of other organisms bring about denitrification. The first of the denitrifying organisms named works best in absence of oxygen; the second is aerobic and works most energetically in connection with *Bacillus coli-communis*. The discovery of the true nature of nitrification was made by Schloesing and Müntz in 1877. Since that date the nature of the organisms causing nitrification and the conditions best suited to their activity have been carefully studied by many other investigators. These studies have shown that the activity of the nitrifying organisms is limited by a certain range of temperature, viz. from slightly above freezing to about 50° C., the organisms being most active, according to Schloesing and Müntz, at a temperature of about 37° C. Other essential conditions are an adequate supply of air (oxygen), for which reason activity is generally confined to the surface layer of soil and moisture, and the presence of certain mineral plant food constituents, especially phosphoric acid and a salifiable base (lime as carbonate).

Nitrification will go on only in a slightly alkaline medium, but excessive alkalinity is as fatal to the process as acidity. Winogradsky, Warington, and Frankland have demonstrated the interesting fact that the nitrifying organisms do not require organic matter, but can grow in a purely mineral medium, deriving their carbon from carbon dioxide. The organisms are widely distributed and very abundant in all soils except such as are deficient in lime compounds and are acid. Müntz found them in abundance on the bare surfaces and in the cracks and fissures of rocks at the summit of mountains in the Pyrenees, Alps, and Vosges. They are also found in well water, river water, and sewage. As a rule they do not occur in rain or in the air. They decompose carbon dioxide most readily, and hence cause nitrification most rapidly in the dark.

While nitrification probably goes on to some extent during the winter, the conditions are usually most favorable to rapid nitrification during the summer months, especially in fields lying in bare fallow. The rate is of course very variable. Warington found it in an unfertilized Rothamsted soil to be 1.3 pounds of nitric nitrogen per day per acre to a depth of nine inches. Similar soil fertilized with sulphate of ammonia showed nearly twice this rate. Much higher

rates than these have been reported. Ammonium salts, since they have already passed the first stage of nitrification, are considered more readily nitrifiable than organic substances which must first be converted into ammonium compounds. Müntz and Girard place them first in order of nitrifiability; then follow guano, green manures, dried blood and meat, powdered horn, poudrette, wool, and leather. Frequently, however, the rate of nitrification of ammonium salts is found to be much slower than that of organic manures. This may be due to a deficiency of lime or to other unfavorable conditions, but Withers and Fraps report experiments in which the order of nitrification of different fertilizing materials in presence of an abundance of calcium carbonate was: dried blood, cottonseed meal, dried fish, bat guano, tankage, ammonium sulphate, bone. A portion of the nitrogen of soil humus is readily nitrifiable, while a part strongly resists the action of nitrifying organisms. The rate of nitrification in barnyard manure in the soil is very variable, but is probably greater than that of soil nitrogen. The old-time nitre beds or plantations were simply examples of rapid nitrification under peculiarly favorable conditions.

The constant production of nitrates in the soil and the readiness with which they are washed out in the drainage furnish a strong argument in favor of the practice of a system of cropping which keeps the soil covered with vegetation as constantly as possible. The conditions favorable to denitrification are exactly the opposite of those which favor nitrification, viz. excess (and deficiency) of water and a limited supply of air (oxygen). Under certain conditions denitrification is especially rapid in barnyard manure and results in considerable losses of nitrogen from this material.

NITRITE OF AMYL. See AMYL NITRITE.

NITRITES. The salts of nitrous acid (q.v.).

NITRO-BENZENE, or NITRO-BENZOL, $C_6H_5NO_2$. An aromatic nitro-compound manufactured from the benzene derived from coal-tar, and in its turn transformed into the aniline that is used in making dye-stuffs. Nitro-benzene is an oily yellow liquid of specific gravity 1.2 at 0° C. (32° F.) and boiling at 205° C. (401° F.); it may be distilled without decomposition. It has a sweet taste, is insoluble in water, but dissolves freely in alcohol and ether. Its odor is very similar to that of oil of bitter almonds, which has led to its use in perfumery, under the name of *essence of mirbane*. Most of the nitro-benzene of commerce is, however, transformed into aniline. On a large scale nitro-benzene is made by gradually adding a quantity of benzene to a mixture of concentrated nitric and sulphuric acid placed in a large iron vessel, the tempera-

ture being kept low by cooling with water, and the mixture being constantly stirred with the aid of some special arrangement with which the vessel is provided. After all the benzene has been added, the temperature is raised for a short time to about 80°C . (176°F .). Then the mixture is diluted with water and distilled with a current of steam. For laboratory purposes nitro-benzene may be purified by washing with dilute soda, drying, and subjecting to a process of fractional distillation. Nitro-benzene is a very poisonous substance, its vapors, if inhaled, being capable of causing coma and death in a few hours.

NITRO-CELLULOSES. See GUNCOTTON.

NITROGEN (from Neo-Lat. *nitrum*, nitre, natron, Lat. *nitrum* + Gk. *-γενής*, *-genēs*, producing, from *νιτρεός*, *gignesthai*, to become). A gaseous element discovered by Rutherford in 1772, who found that when a small animal was allowed to breathe air in a confined space for a time, and the carbon dioxide thereby produced removed by absorption, a gas still remained which was incapable of supporting respiration. On account of its presence in nitre, Chaptal named it nitrogen (French *nitrogène*); and owing to its incapacity for supporting life, Lavoisier named it *azote* (1787). It is one of the most widely distributed of the elements, and is found free in the atmosphere, of which it forms about four-fifths by volume. Considerable quantities of it occur in volcanic gases and in the air-bladders of certain fishes, the bone cavities of birds, and in plants. It is likewise found in meteorites, and its presence has been demonstrated in the atmosphere of the sun. In combination it is found associated with oxygen as nitric and nitrous acids, with hydrogen as ammonia, and with oxygen, hydrogen, and carbon in many substances of organic origin. It is an essential constituent of animal and vegetable organisms, and is found in many minerals, as saltpetre and soda nitre. The separation from nitrogen of the other gases contained along with it in atmospheric air was considered a very easy matter before the discovery of argon (q.v.). In fact, the water-vapor of the air can be readily removed by the use of strong sulphuric acid or burnt lime or any other good dehydrating agent; the carbonic acid of the air can be removed by means of the caustic alkalis or alkaline earths; the oxygen can be removed by passing air over red-hot copper, by burning phosphorus in the air, and by similar methods. But argon is itself an inert substance that cannot be removed by any known chemical reagent. Nitrogen might possibly be isolated from it by liquefying the mixture and subjecting it to fractional distillation. But an easier and more certain way of obtaining pure nitrogen consists in causing it to be liberated from certain of its compounds. Thus pure ammonium nitrite breaks up, on heating, into pure nitrogen and water. Similarly, nitrogen may be obtained by heating a mixture of potassium nitrite and ammonium chloride, or by heating equal parts of potassium nitrite and ammonium sulphate with a mixture of three parts of water and two parts of glycerin.

Nitrogen (symbol, N; atomic weight, 14.04) is a colorless, tasteless, and odorless gas. By the application of pressure at low temperature (see CRITICAL POINT), nitrogen has been liquefied, and the liquid has been caused to freeze. In the gaseous

state it is slightly soluble in water. It combines directly with but very few elements, although indirectly it can be made to form compounds with a large number of the elementary bodies. Nitrogen combines with oxygen to form the following five oxides: (1) *Nitrogen monoxide*, or nitrous oxide, N_2O , called also 'laughing gas,' was originally obtained by Priestley in 1772, by the action of moist iron filings on nitric oxide (NO). It is now usually prepared by the distillation of ammonium nitrate, and is a colorless gas of pleasant odor and sweetish taste. It is a valuable anæsthetic (q.v.), and is largely employed for producing insensibility during short operations. It may be considered as the anhydride of hyponitrous acid (q.v.). (2) *Nitrogen dioxide*, or nitric oxide, NO , was first obtained by Van Helmont, who failed, however, to recognize it as a distinct chemical substance. Its properties have been clearly known since 1772, when Priestley succeeded in isolating it, and its composition was correctly determined by Cavendish in 1784. It is formed when various substances (hydrogen, illuminating gas, wood, coal, etc.) are burned in the air. It may be prepared by the action of cold dilute nitric acid on metallic copper (concentrated nitric acid yields laughing gas). In the absence of oxygen it remains colorless; but it readily combines with oxygen to form red fumes of nitrogen tetroxide. Still, if heated alone to 520°C ., nitric oxide decomposes with formation of laughing gas, free nitrogen, nitrogen trioxide, and nitrogen tetroxide. Solutions of ferrous salts absorb considerable quantities of nitric oxide. (3) *Nitrogen trioxide*, N_2O_3 , may be obtained by heating nitric acid with starch in a large retort, drying the gaseous product over calcium chloride, and liquefying it by means of freezing mixtures. At 10°C . it is a dark blue liquid and it boils below 0°C . Within a few degrees above that point its vapors decompose into nitric oxide and nitrogen tetroxide. The decomposition, however, is partial, and even at as high as 150°C . the trioxide is not yet completely decomposed. The trioxide has been recommended as a disinfectant; for this purpose a mass containing one part of sodium nitrite, two parts of acid sodium sulphate, and two parts of gypsum, is kept dry when not used; on mixing it with water it yields the trioxide of nitrogen. Nitrogen trioxide is the anhydride of nitrous acid (q.v.). (4) *Nitrogen tetroxide*, or nitrogen peroxide, has the formula N_2O_4 at lower temperatures and NO_2 at high temperatures. (See DISSOCIATION.) The tetroxide is formed when dry nitric oxide comes in contact with oxygen. It may be prepared by passing a perfectly dry mixture of two parts (by volume) of nitric oxide and one part of oxygen into a U-tube immersed in a freezing mixture at -20°C ., and if the mixture is absolutely dry the tetroxide is thus obtained in the form of colorless crystals. Above -20°C . it is usually a liquid of yellow color, the color becoming more and more intense as the temperature rises. The vapor is the more intensely colored, the more it is dissociated. (See DISSOCIATION.) The boiling-points of the liquid, as given by different observers, are between 22° and 28°C . (5) *Nitrogen pentoxide*, N_2O_5 , was discovered by Sainte-Claire Deville in 1849. It may be prepared by the action of phosphorus pentoxide on nitric acid completely dehydrated by repeated distillations with

sulphuric acid and freed from nitrogen trioxide by passing a current of dry air. The nitrogen pentoxide thus obtained is passed into a suitable receiver kept in a freezing mixture; when a crystalline mass has formed in the receiver, the portion remaining liquid is decanted off; then the crystals are allowed to melt, the liquid is again caused to solidify, and any portion remaining liquid is again rejected. By repeating this operation several times, it is easy to obtain perfectly pure nitrogen pentoxide. The colorless rhombic crystals of this substance may be preserved very long by keeping out of contact with the air and away from light. They melt at about 30° C. and the liquid boils at about 45° C., but slightly above this temperature the substance undergoes decomposition. If exposed for some time to the light the crystals melt and may decompose with explosive violence. Nitrogen pentoxide is the anhydride of nitric acid.

The compounds of nitrogen with hydrogen include ammonia, NH_3 , hydrazine, N_2H_4 , and hydrazoic acid, N_3H . The most important of the compounds of nitrogen with the halogens is nitrogen tri-chloride, NCl_3 , which may be considered as ammonia in which all the hydrogen has been replaced by chlorine. It is prepared by passing chlorine gas into a warm solution of ammonium chloride. It is a yellowish, volatile, extremely explosive, oily substance, which must be handled with extreme caution and the preparation of which should not be undertaken by any one not thoroughly accustomed to experimenting with dangerous substances. Its explosion may be brought about by the action of heat or light, or by contact with phosphorus, turpentine, and other substances.

NITROGLYCERIN, or **GLONIN**, $\text{C}_3\text{H}_5\text{O}_2(\text{NO}_2)_3$. An explosive substance discovered by Sobrero in 1846. Although Sobrero pointed out the possibilities of the substance as an explosive agent, it found no other than a limited use, in dilute alcoholic solution, as a remedy for headache, under the name of 'glonoin.' Its use as an explosive remained undeveloped until 1862, when Alfred Nobel (q.v.) discovered means of controlling its explosive properties and devised a practical method of making it on a large commercial scale. Nitroglycerin is made by running from 210 to 230 pounds of pure glycerin into 1500 pounds of mixed acids, consisting of three parts by weight of concentrated sulphuric, and two parts by weight of concentrated nitric acid. As considerable heat is set free by the reaction it is necessary that the glycerin should be added slowly and intimately mixed with the acids. This is accomplished by injecting the glycerin into the acid mixture, stirring the whole, and cooling it by means of cold water run through pipes which are coiled within the leaden vessel ('the converter') in which the conversion is carried out. When all of the glycerin is converted into nitroglycerin, the entire charge of the converter is run into a tank, where, on standing, the nitroglycerin separates in a layer on top of the acids. The nitroglycerin is then drawn off, washed with water until nearly free from acid, then with a dilute solution of sodium carbonate until it is neutral in reaction, and then run through a filter by which it is dried.

Pure nitroglycerin is a colorless, odorless,

transparent oily liquid, but as made on a commercial scale it is colored various shades of yellow. Solidified nitroglycerin melts at 8° C. (46.4° F.). Its specific gravity in the liquid state is 1.599; when frozen, 1.735. It gives off vapors to a slight extent at the ordinary temperature, and it may be completely evaporated by continuous exposure at a temperature of 70° C. (158° F.). It is soluble in methyl alcohol, ethyl alcohol, ether, benzene, and many other organic liquids, but it is nearly insoluble in water. When the vapors of nitroglycerin are inhaled or the substance is taken into the stomach, it produces most violent headaches. Some persons are so sensitive to its action that they are poisoned by it when nitroglycerin touches the skin. The production of undecomposed vapor of nitroglycerin, when the substance is exploded, seriously interferes with its use in tunnels, mines, and other confined places. The common antidote is black coffee. Pure nitroglycerin will keep indefinitely at common temperatures; but if continuously exposed to temperatures above 45° C. (113° F.) it undergoes decomposition, which progresses the more rapidly the higher the temperature. At 180° C. (356° F.) it explodes violently. It is also decomposed by contact with sulphuric acid, or with an alkali, and decomposition due to the presence of acid has repeatedly given rise to accidental explosions of this substance. It may be exploded by percussion, concussion, or fire, but the surest and safest way of firing it is by exploding a detonator containing mercuric fulminate in contact with it.

The name nitroglycerin, as applied to the substance discovered by Sobrero, is a misnomer, and conveys a false impression as to its accepted constitution; for instead of being, as supposed when the name was given, a nitro-substitution compound, it has been shown by Berthelot to be a nitric ester, namely, the tri-nitrate of glyceryl ($\text{C}_3\text{H}_5\text{O}_2$), a radicle forming part of the molecule of glycerin.

Nitroglycerin is used directly in 'shooting' oil wells to make them yield more freely, and in blasting under water; but its liquid state renders it unsuitable and even dangerous for general use as an explosive. Its largest uses are in the manufacture of dynamite, blasting gelatin, and some varieties of smokeless powders, notably cordite and ballistite. Medicinally, nitroglycerin is used in a weak dilution to reduce arterial tension and relieve the heart of strain, by dilating the arterioles and capillaries. Its action is similar to, though less rapid and fugacious than that of amyl nitrate, and less persistent than that of the nitrite of sodium or potassium. It is employed in a certain type of asthma, in chorea, epilepsy, angina pectoris, and gastralgia. It has been recommended in certain forms of Bright's disease. Although the manufacture of nitroglycerin did not begin in the United States until 1867, and its progress was at first slow, in the year 1900 there were manufactured here 35,482,947 pounds, of which amount 31,661,806 pounds were used in the manufacture of dynamite, blasting gelatin, and smokeless powder. NITRO-HYDROCHLORIC ACID, NITRO-MURIATIC ACID, or AQUA REGIA. See AQUA REGIA.

NITROPHILOUS PLANTS (from Lat. *nitrum*, natron + Gk. *φίλος*, *philos*, loving, from *φιλεῖν*, *philein*, to love). Plants which thrive best in soils rich in nitrogenous materials. The term is objectionable, since it implies qualities about which there is great doubt. Certain plants found particularly in the neighborhood of manure piles have been supposed to prefer soils rich in nitrogenous substances, but the evidence upon which this based is very slight. It is, of course, true that all plants require nitrogenous food, which is particularly hard to get in certain cases, and especially in the case of plants which have no symbiotic fungus relation. It may be, therefore, that autophytes require larger amounts of nitrate of ammonia than do mycotrophic plants.

NITROUS ACID (from Lat. *nitrosus*, full of natron, from *nitrum*, natron), HNO_2 . An acid compound of hydrogen, nitrogen, and oxygen, known chiefly by its salts, which are called *nitrites*. The acid itself is not known in an isolated state, being a very unstable compound; even in an aqueous solution rapidly decomposing into nitric acid and nitric oxide (NO). Nitrites, however, are very stable bodies and are usually formed by the reduction of nitrates. Small quantities of ammonium nitrite are found in our atmosphere, and other nitrites are contained in the juices of certain plants. In nature the nitrites are formed usually by the decomposition of organic matter, and generally indicate contamination with sewage. One of the most important nitrites is that of potassium, which is formed either by fusing potassium nitrate or by heating that salt with lead or copper. Certain organic compounds of nitrous acid are of considerable importance.

NITROUS ETHER, or ETHYL NITRITE, $\text{C}_2\text{H}_5\text{NO}_2$. A pale yellow fluid, lighter than water, and evolving an agreeable odor of apples. On evaporation, it produces a great degree of cold; it boils at 64.4°F. (18°C.), and it is very inflammable. It does not mix with water, but is readily miscible with alcohol. When kept in contact with water it soon decomposes, and an acid mixture of a very complicated character is formed. It is usually prepared by the action of nitric acid on alcohol. The *spirit of nitrous ether* or *sweet spirit of nitre* used in medicine is a mixture of nitrous ether with about four times its volume of rectified spirit. It is used, in conjunction with other medicines, as a diuretic, especially in the dropsy which follows scarlatina; and it is employed, in combination with acetate of ammonia and tartarized antimony, in febrile affections.

NITROUS OXIDE. Nitrogen monoxide, or laughing gas, N_2O . It is made by heating solid ammonium nitrate in a flask. The result is water and nitrous oxide, $\text{NH}_4\text{NO}_3 = 2\text{H}_2\text{O} + \text{N}_2\text{O}$. Laughing gas possesses the peculiar property of intoxicating animals. It may be inhaled pure or mixed with atmospheric air for a considerable period with safety. When first inhaled there is a feeling of exhilaration experienced, which is succeeded by profound anæsthesia, during which minor surgical and dental operations may be performed. There is no resulting depression, and in cases

where the inhalation is not continued over twenty minutes the patient experiences absolutely no unpleasant sensations, and is able to go about his avocations without loss of time, on recovering consciousness. It is the custom with many American surgeons to secure anæsthesia by the use of nitrous oxide and then substitute ether as the anæsthetic, in all operations where over fifteen or twenty minutes are requisite for the completion of the work. This expedient prevents the nervous excitement consequent upon the administration of ether from the first, diminishes shock, and prevents much of the nausea consequent to ether anæsthesia. The term laughing gas is used because the patient is apt to laugh or exhibit other emotion if but a little gas is administered, and then the inhalation is intermitted. See NITROGEN.

NITTIS, GIUSEPPE DE (1846-84). An Italian painter, born at Barletta, Naples. He was a pupil of the Naples Academy, but found his style rather by diligent observation of nature, and in 1868 went to Paris, where he studied under Brandon, Gérôme, and Meissonier. After exhibiting genre scenes and landscapes he devoted himself chiefly to the painting of city views, the result of extensive travels, and distinguished for keen observation, elegant drawing, and extraordinary transparency of color. In 1878 he was awarded a first-class medal for a "Corner of Boulevard," "Triumphal Arch," a water color, and "In the Bois de Boulogne," a pastel. His frequent studies in the open air led him gradually to a conception of nature much akin to that of the Impressionists, and from 1879 on he cultivated especially the pastel. Of his Parisian views the "Place des Pyramides" (1876) and "Place du Carrousel" (1883) found their way into the Luxembourg Museum, and several genre scenes are in private collections in New York City and Philadelphia.

NITZSCH, KARL IMMANUEL (1787-1868). A German theologian. He was born at Borna, Saxony. He studied for the church at Wittenberg, where he took his degree in 1810, and where, in 1813, he became parish minister. In 1822 he was called to Bonn as ordinary professor of theology and university preacher. In 1847 he succeeded Marheineke at Berlin, and as professor, university preacher, and upper consistorial counselor, he exercised with prudence and moderation a wide ecclesiastical influence. He belonged to the school, of which Neander was the chief representative, which sought to reconcile faith and science by pointing out their distinctive spheres; in theology he subordinated dogma to ethics, and became one of the leaders of the *Vermittlungstheologie*. Besides numerous smaller treatises on dogmatics, the history of dogmas and liturgies, three larger works call for special mention: his *System der christlichen Lehre* (1829; 6th ed. 1851; Eng. trans., *System of Christian Doctrine*, Edinburgh, 1849); his *Praktische Theologie* (1847); and his *Predigten*, or sermons, of which several collections have appeared.

NIU-CHWANG, nū'chwāng', or YING-TSE. The only treaty port of Manchuria, China, situated in the Province of Shing-king, about 13 miles from the mouth of the Liao River, which falls into the Gulf of Pe-chi-li, and on the southern branch of the Trans-Siberian line (Map: China, F 3).

It has greatly increased in importance since the construction of the Trans-Siberian line, and the recent Russian acquisitions in the southern part of the peninsula, which make Niu-chwang the only port of Manchuria open to foreign trade. The vicinity of Niu-chwang is not very productive agriculturally, but important coal mines have lately been opened along the railway line, and the city acquires additional importance from its railway connection with Tien-tsin and Peking. The chief exports are beans, bean cake, and oil, which go largely to Japan. The imports consist mostly of cotton goods, which come largely from the United States, petroleum, and opium. The value of the exports in 1900 was nearly \$8,000,000, of which the exports to foreign countries amounted to about \$2,700,000. The imports for the same year were valued at over \$7,000,000, of which foreign imports amounted to over \$5,000,000.

Niu-chwang has a considerable foreign colony, and many consular representatives, including two from the United States. The population of the city is estimated at 50,000. Niu-chwang, or rather the small town of the same name, about 40 miles from the coast, was opened to foreign trade by the treaty of 1858. The present port was taken by the Japanese in 1895, and was originally a part of the territorial concessions of China, but Japan was forced to relinquish it. Since the uprising of Manchuria against Russia in 1900 Niu-chwang has been occupied by Russia, and its administration is still to a large extent in Russian hands, although the date set for its evacuation (April 8, 1903) is passed.

NIUE, né'wá, or SAVAGE ISLAND. A small coral island in the Pacific Ocean, situated about 350 miles southeast of the Samoan Islands, in latitude 19° S., longitude 170° W. Area, 36 square miles. It is 200 feet high, consisting of coral limestone, and has a fertile soil. The chief export is copra. Population, in 1901, 4050, all Christians. In 1900 Niue was taken under British protection as a dependency of New Zealand.

NIVELLES, né'vél' (Flem. *Nyvel*). A town in the Province of Brabant, Belgium, 18 miles south of Brussels (Map: Belgium, C 4). Its most important edifice is the Romanesque Church of Saint Gertrude, dating from 1048 and containing interesting relics. Nivelles has manufactures of linen, cotton, and lace, and carries on an active trade in grain and live stock. The town grew up around the ancient convent founded in the seventh century by the daughter of Pepin of Landen. Population, in 1900, 11,475.

NIVERNAIS, né'vár'ná'. A former province in the middle of France. It was ruled in the Middle Ages by the Counts of Nevers, who were succeeded by the Duke of Nevers. It is at present included almost entirely in the Department of Nièvre.

NIVÔSE, né'vôz' (Fr., snow month). The fourth month in the French Republican calendar. It ran from December 21st to January 19th in the years I., II., III., V., VI., and VII.; from December 20th to January 20th in the years IV., VIII., IX., X., XI., and XIII.; and from December 23d to January 21st in the year XII.

NIX (Ger. *Nix*, OHG. *nichus*, *nihhus*, Icel. *nykr*, AS. *nicor*, water-goblin, water-beast, Eng. *Nick*, name of the Devil; connected with GK. *νίττω*, *niptein*, Skt. *nij*, to wash). The common name for all water spirits in the Teutonic mythology. They are represented as of human form, or sometimes as passing into that of a fish or of a horse. They love music and dances, and possess the gift of prophecy, like the Greek muses, sirens, and other water-gods. The nix taught, in return for a good gift, the art of playing on a stringed instrument; and in the evening sunshine the nixes, combing their long hair, were wont to mingle in the dances of mortals; but their company was dangerous, for, though sometimes wearing a mild appearance, they were more frequently cruel and malignant.

NIX'ON, JOHN (1733-1808). An American soldier. He was born in Philadelphia, and was the son of a shipping-merchant. Upon the passage of the Stamp Act, in 1765, he became active in opposing the encroachments of the English Government upon American liberties, signed the non-importation agreement, and was a member of the first committee of correspondence in Pennsylvania. In April, 1775, he became lieutenant-colonel of the 3d battalion of the 'Associators,' and he was also a member of the Committee of Safety. From May to July, 1776, he had charge of the defenses of the Delaware at Fort Island, after which he was placed in command of Philadelphia. On July 8th he made the first public proclamation of the Declaration of Independence from the steps of the Philadelphia Court House. He resigned from the army in 1780, and in the same year became a director of the so-called 'Bank of Pennsylvania.' Afterwards he assisted in organizing the Bank of North America, of which he was president from 1792 till his death in 1808.

NIXON, LEWIS (1861-). An American naval architect, born in Leesburg, Va. He graduated at the United States Naval Academy in 1882, being first in his class; then spent three years in the Royal Naval College, Greenwich, England, where he specialized in ship-building and graduated in 1885; and having been appointed naval constructor in the United States Navy, in 1884, went on several tours of inspection through European navy yards, before his return to America. He was superintending constructor of the navy at Cramp's shipyard and assistant constructor at the Brooklyn Navy Yard, and in 1890 designed the battleships of the *Indiana* class. When these vessels were contracted for by the Cramps of Philadelphia Nixon became their superintending constructor, resigning from the navy. Five years afterwards he left the Cramps and leased the Crescent Shipyard, Elizabeth, N. J., where, with only four hundred feet of water front, he built many vessels. He became connected with many other manufacturing concerns, and in 1898 was appointed president of the New York East River Bridge Commission. In 1901 he was named head of Tammany Hall, but resigned the post in May of the next year after five months' service. He became president of the United States Shipbuilding Company of New York City in 1902.

NIZA, *Sp. pron.* né'thà, MARCOS, or MARCO DE, known as Fray MARCOS (c.1495-c.1550). An

Italian missionary and explorer in the service of Spain, born at Nice, whence his name. He became a Franciscan monk, was sent to America in 1531, and went first to Peru, then to Guatemala, and finally to Mexico. In 1539, under the immediate direction of Francisco Vasquez de Coronado, Governor of 'New Galicia,' he, accompanied by a number of natives and a negro, Estevanico (or Stephen), who had been with Cabeza de Vaca on his journey across the continent, made an extended journey of exploration into the Northwest to investigate the stories told by Cabeza de Vaca. He penetrated into territory now forming part of Arizona, thus earning the title 'Discoverer of Arizona,' by which he is sometimes known, and on his return made a report, *Descubrimiento de las siete ciudades*, in which he gives the first positive account of the Seven Cities of Cibola. The exact route taken by Fray Marcos is not known, but it is fairly certain that he crossed Sonora and Arizona to the region of Zúñi, and that the seven cities to which he referred were Zúñi pueblos. After his return, Fray Marcos was made provincial of his Order, and in 1540-42 accompanied Coronado in the latter's famous expedition into what is now Arizona and New Mexico, as a result of which Fray Marcos's accounts of the great wealth of Cibola were proved to be fabulous.

NIZAMI, né-zá'mé (1141-1203). A Persian poet, whose full name was Nizām ed-Din abu Mohammed Ilyas. He was one of the canonic seven epic poets of Persia. His place of birth is uncertain; from his early home, Ganjah, he is called Ganjavi. The poet's early years were spent in asceticism, and his first poem, *Makhzān al-'asrār*, or 'Treasury of Mysteries,' is didactic in tone and strongly influenced by the Sufi poets, although it shows in the narrative parts traces of the *Shāh-Nāmāh* of Firdausi. It was written when Nizami was forty. Soon after he wrote *Khusrū wa Shirin* (1180), which dealt with the love of Khusru Parviz and his rival, the architect Farhad, for Shirin, an Armenian princess (possibly an Irene of Byzantium), and the Shah's success. The poem won Nizami high favor at court, which did not corrupt his independence. The *Dirān*, a collection of ethical poems, dates from 1188. With the old theme of Laila and Majnun, a Bedouin tale of lovers separated by family feud, their brief joy on earth and their happy meeting in Paradise, the poet returned to his own field of the romantic epic. The *Iskandar-Nāmāh*, an account of the legendary adventures of Alexander the Great, is an attempt to rival Firdausi; its latter part is ethical and makes Alexander a searcher for truth. In 1197 Nizami wrote his great romance, the *Haft Paikār*, or 'Seven Beauties,' in which seven princesses, the daughters of Behram Gur, each tell a story. Nizami died at Ganjah. His five poems called *Panj Ganj*, or the 'Five Treasures,' were prototypes of several quintuples or series of five. The *Makhzān al-'asrār* was edited by Bland (London, 1844); the *Khusrū wa Shirin* was translated by Hammer (Leipzig, 1809); the *Lailā wa Majnūn* was edited at Lucknow in 1888 and translated by Atkinson (London, 1836); the *Haft Paikār* was edited and translated by Erdmann (Kazan, 1844); the first part of the *Iskandar-Nāmāh* has been edited repeatedly, as at Lahore in 1889, and

translated by Clarke (London, 1881), and in part by Rückert (Nuremberg, 1824); the second part was edited by Sprenger (Calcutta, 1852-69). Complete editions of Nizami's works have been issued at Bombay in 1834 and 1839, and at Teheran in 1845. Consult Bacher, *Nizamis Leben und Werke* (Leipzig, 1872).

NIZAM'S DOMINIONS. A native State of India. See HYDERABAD.

NIZHNI-NOVGOROD, nyézh'nyé nóv'gò-ród. A government of Russia, bounded by the Government of Kostroma on the north, Viatka, Kazan, and Simbirsk on the east, Penza and Tambov on the south, and Vladimir on the west. Area, about 20,000 square miles (Map: Russia, F 3). The government is divided by the Volga and the Oka into two parts, of which the northern is low, marshy, and covered with thick forests, while the southern is more or less elevated and intersected by many river valleys. The district is watered by the Volga, the Oka, the Vetluga, and a number of smaller rivers, most of them navigable. The climate does not differ essentially from that of other parts of Central Russia. The mean annual temperature is about 40°. Of minerals Nizhni-Novgorod has iron, alabaster, and various kinds of clay. Agriculture is the foundation of the economic life of the region. Rye and oats are the chief agricultural products. The forests cover nearly 40 per cent. of the total area.

In the development of the house industry the Government of Nizhni-Novgorod is inferior only to few parts of Russia. In the northern section wooden articles are the chief manufactures, while in the southern part locks, knives, and other small articles of iron are manufactured. Leather and leather products are manufactured all over the district. Large numbers of the inhabitants are also engaged in navigation. The factory system is only slightly developed. The census of 1895 gives for the Government of Nizhni-Novgorod 361 establishments, employing over 20,000 persons and yielding an output of over \$10,000,000. The chief products are flour, machinery, chemicals, leather, spirits, etc. The commerce is practically confined to the capital, Nizhni-Novgorod. Population, in 1897, 1,600,304, including a considerable number of Mordvins (q.v.) and Tatars.

NIZHNI-NOVGOROD. Capital of the government of the same name, and a great commercial centre of Russia, situated at the confluence of the Oka with the Volga, 273 miles east of Moscow (Map: Russia, F 3). It consists of the upper town with the Kremlin, the lower town along the Oka and the Volga, and the fairgrounds with the adjoining suburb on a sandy tongue formed by the confluence of the two rivers and connected by a bridge with the town proper. The upper town, situated on hilly ground, contains the principal buildings—the Kremlin, surrounded by a wall dating from the sixteenth century and inclosing two cathedrals, the ancient palace now occupied by the Governor, the arsenal, and the law courts. The town has about 60 Greek Orthodox churches, a number of monasteries, a mosque, and an Armenian church. Among the ecclesiastical edifices are the church in the Monastery of the Annunciation, containing a holy image of great antiquity (933), which attracts many pilgrims, the thirteenth-century Cathedral of the Archangel, with a fine treasury, and the

Cathedral of the Transfiguration, rebuilt in 1834 and holding the tombs of the princes and princesses of Nizhni-Novgorod. The chief secular buildings are the palace of the Governor, the Museum of Art, housed in one of the Kremlin towers, and the theatre. The educational institutions include a theological seminary, an institution for the sons of noblemen, a military academy, two gymnasia, a *Realschule*, and a number of special schools.

The fair to which the city chiefly owes its fame and importance was transferred to Nizhni-Novgorod from Makariev (about 55 miles below the city) in 1817. The value of the merchandise brought annually to the fair averaged somewhat over \$16,000,000 for the decade of 1817-26, about \$96,000,000 for 1877-86, and about \$89,000,000 for 1887-96. The construction of railways and the general modernization of commercial methods in Russia during the last part of the nineteenth century have naturally detracted from the importance of the fair. It is still, however, a great factor in the economic life of the country, and derives additional interest from the fact that it is the most important representative of a commercial system which is rapidly disappearing from civilized countries. The central industrial governments of Russia are represented at the fair by their different manufactures, the regions of the Lower Volga by fish, and that of the Kama by salt. The Caucasus sends petroleum, wine, and native manufactures; the southwestern governments, sugar; and the region along the middle course of the Volga, grain and lumber. From Siberia come furs, tallow, and oil; from China, tea; from Central Asia, furs and raw cotton; from Persia, fruit; and from Western Europe manufactures and groceries. The fair, which opens in the last week of July and lasts till about the middle of September, attracts over 100,000 merchants from every part of the Empire.

There are thousands of shops, the material of construction being stone, and a splendid fair palace was erected in 1890. The grounds are lighted by electricity and traversed by an electric railway line. The industries of the city are comparatively unimportant. The chief products are beer, locomotives, machinery, and candles. There are a number of important financial institutions. Population, in 1897, 95,100, which is increased during the fair to about 200,000.

The town was founded by the Grand Prince of Suzdal, Yuri Vsevolodovitch, in 1221. It was attacked repeatedly by the Tatars and the neighboring princes and suffered much from famine and pests. It was annexed to the Principality of Moscow about the close of the fourteenth century.

NIZHNI-TAGILSK, *tà-gilsk'*. An important mining and iron manufacturing centre in the Government of Perm, Russia, situated in the Ural Mountains, 88 miles northwest of Ekaterinburg (Map: Russia, J 3). In the vicinity are extensive iron, copper, gold, and platinum deposits and large iron foundries and steel mills. The first iron mill in this region was founded by Nikita Demidoff in 1725. Population, in 1897, about 30,000.

NIZHNI-TCHIRSK, *chirsk*. A town in the territory of the Don Cossacks, South Russia, situated on the Don, 210 miles northeast of Novo-Teherkask. It lies in a vine-growing district and has an important annual fair lasting for ten days. Population, in 1897, 15,196.

VOL. XIV.—38.

NJÖRD, *nyërd*. In Scandinavian mythology, the father of Frey. See *Æsir*; *Frey*.

NOACK, *nō'āk*, AUGUST (1822—). A German historical painter, born at Darmstadt. A pupil of Sohn, Lessing, and Schadow at the Düsseldorf Academy in 1839-42, he studied afterwards in Munich and Antwerp. In 1855 he settled in his native city and was appointed grand ducal court painter, and in 1871 professor at the Polytechnicum. Besides a "Visit of Landgrave Philip the Magnanimous to Luther" (Rostock Gallery), and "The Disputation at Marburg" (Darmstadt Gallery), he painted several fine altarpieces.

NOAH, *nō'ā* (Heb. *Nō(a)ch*). According to the Book of Genesis, the son of Lamech, who appears in the Old Testament in a double capacity: (a) the chief survivor of the Deluge, which involved the destruction of all mankind (Gen. vi. ix. 17), and hence the second father of mankind; and (b) the first agriculturist to plant vines (ib., ix. 20-27). According to critical scholars, in the biblical study of Noah two traditions have been connected with him and combined, the one a story of a destructive flood which came to the Hebrews from the Babylonians (see *DELUGE*), the other a tradition as to the beginnings of civilization, of which 'wine' is a general symbol in the Old Testament. This second tradition belongs to the same category as the tracing of the arts to Tubal Cain and Jubal (Gen. iv. 21-22) and of the building of cities to Cain (ib., 17); it is of a 'scholastic' character, whereas the other rests upon popular mythology and legendary lore. The attachment of various originally independent stories to one and the same personage is a common phenomenon in the process of myth and legend formation. The hero of the Babylonian deluge story bears two names—Pir-napishtim ('source of life') and Atra-hasis or Hasis-atra ('very clever' or 'very pious'). Both names are symbolical, and it is possible that a connection with Noah appears in the character of the latter as the father of the new mankind—in this sense the 'source of life'—and in the description of Noah (Gen. vi. 9) as *qaddik tamim*, 'pious exceedingly,' which is almost a literal translation of *Hasis-atra*. It is not absolutely certain, however, that the name of the hero in the Hebrew story was Noah. Gen. v. 29 suggests that it was Naham or Nahman.

NOAH, BOOK OF. See *APOCRYPHA*, section on *Old Testament*.

NOAH, MORDECAI MANUEL (1785-1851). An American journalist and politician, born in Philadelphia. He was appointed Consul-General at Tunis in 1813, at a time when the second war with England offered the Barbary Powers almost irresistible inducements to prey on American commerce. After his return to the United States the following year he edited the *National Advertiser* (a Democratic paper) and the *Courier and Enquirer*. He established the *Evening Star* in 1834, but soon withdrew from connection with the daily press and became one of the founders of the weekly *Sunday Times*. He held at various times the offices of sheriff of New York County, surveyor of the port of New York, and a judge of the Court of Sessions. He was a Jew, and in 1820 attempted to found a Jewish colony on Grand Island in the Niagara River. He wrote a number of dramas and other works, including

Travels in England, France, Spain, and the Barbary States (1819); and a *Discourse on the Restoration of the Jews* (1845).

NOAILLES, nō'y'y'. A noble French family of Limousin, which dates from the eleventh century. **ADRIEN MAURICE**, Duke de Noailles (1678-1766). A Marshal of France, born in Paris, the eldest son of Anne Jules, Duc de Noailles (1650-1708), who was Marshal also. The son bore the title of Count d'Ayen, entered the Musketeers in 1692, and served in Catalonia in 1694-95 and in Flanders in 1696-97. In 1715 the Duke entered the council of regency and became president of the Conseil de Finance, a post which he lost three years afterwards by his opposition to Law. After fifteen years of retirement, he received a command under the Duke of Berwick in the war of the Polish Succession, and in 1734, after his chief's death, was made Marshal of France. In the same year he captured Philippsburg, and in the next, at the head of the Sardinian forces, drove the Imperial army out of Italy. His last campaign was in the War of the Austrian Succession, and at Dettingen, in 1743, he was defeated. Entering the Conseil d'Etat, he took control of France's foreign policy, went to Madrid in 1746, prepared the campaigns of 1747 and 1748, and retired in 1756. His two sons, **LOUIS** (1713-93) and **PHILIPPE** (1715-94), were also Marshals of France.—**LOUIS MARC ANTOINE**, Viscount de Noailles (1756-1804), born in Paris, was associated with Lafayette (their wives were sisters) in the aid given to the American colonies in their struggle for independence. In 1789, at the opening of the French States-General, he was a Deputy among the nobles representing Nemours, and made the memorable proposition for the abolition of titles and feudal privileges of all kinds. During the excesses of the Jacobins he went to the United States, but returned to France as soon as the persecution of the old nobility ceased, and a few years later was made brigadier-general in Santo Domingo, where he died from wounds received in the capture of an English sloop of war near Havana by one of the most remarkable feats of naval daring on record.—**PAUL**, Duke de Noailles (1802-85), joined the Court of Louis Philippe in 1830. He published a *Histoire de la maison royale de Saint-Louis établie à Saint-Cyr* (1843) and a *Histoire de Mme. de Maintenon* (1848-50), and became a member of the Academy in 1849. His son, **JULES CHARLES VICTURNIEN** (1826-95), devoted himself to the study of economics and published *Cent ans de république aux Etats-Unis* (1886-89).

NO AM'MON. The name given to Thebes, the capital of Upper Egypt, in the Hebrew text of Nahum iii. 8. The shorter form No occurs in Jer. xli. 25 and Ezek. xxx. 14, 15, 16. The Greek version has μένος Ἀμμων, 'part of Ammon,' in Nahum, and elsewhere Διοσπολίς (*Diospolis*), the common later designation of Thebes; Jerome translated *Alexandria populorum*, probably influenced by the description of the city in Nahum as "situated among the rivers having the waters round about her, whose strength was the sea and water her walls." As the Assyrians called the city Nt, and the Egyptians themselves after the Twenty-first Dynasty called it Nt (probably pronounced Ne-t, Ne, with the feminine ending t; cp. early Coptic Nē), it is probable that the Hebrew consonants were also pronounced Nē.

Net means 'city.' The addition of Ammon renders the reference to Thebes certain. Nahum probably thought of the capture and sack of Thebes by Assurbanipal in B.C. 663. See THEBES.

NOBBE, nō'be, **FRIEDRICH** (1830—). A German agricultural chemist and plant physiologist, born in Bremen. He studied at Jena and Berlin, in 1861 became a professor in the Industrial School at Chemnitz, and in 1868 in the Academy of Forestry and Agriculture at Tharandt. There he established, with the assistance of the Agricultural Union of Leipzig, an experiment station for plant physiology. In 1869 he inaugurated scientific seed-testing, and the publication of the results of his investigations in this subject led to the system of European seed control, with its numerous stations conducted both independently and as branches of the agricultural experiment stations. Among his publications are *Ueber die organische Leistung des Kalium in der Pflanze* (with Schröder and Erdmann, 1871), and *Wider den Handel mit Waldgrassamen für die Wiesenkultur* (1876).

NOBEL, **ALFRED BERNARD** (1833-96). A Swedish inventor and philanthropist, born at Stockholm. As a child he went with his father to Saint Petersburg, where he was educated. In 1850-54 he studied mechanical engineering in the United States as a pupil of the distinguished John Ericsson, and in 1863 took out the first patent for the manufacture of an explosive composed of nitroglycerin and common gunpowder. In 1864 he was granted a second patent. The use of nitroglycerin was for a number of years attended by such serious accidents that the preparation was very widely discarded. In 1867, however, Nobel invented dynamite, or giant powder, composed of 75 per cent. of nitroglycerin and 25 per cent. of kieselguhr, a finely pulverized siliceous material derived from the shells of fossil infusorians. This compound could be handled with less risk than could gunpowder, and was not influenced by heat or damp. In 1870 the inventor patented an improvement known as explosive gelatin. Further inventions by Nobel—the total number reported filed in Great Britain is 129—include ballistite, a propellant which was among the earliest of modern smokeless powders, and artificial gutta-percha. In 1875, by his own statement, he controlled fifteen dynamite factories in various parts of the world, including those near San Francisco and New York City, in the United States. Much of his experimentation in his later years was conducted in his great laboratory at San Remo, near Nice. He subscribed half the amount necessary for the equipment of the aeronaut Salomon André, and gave much to general charities, but is best known as the founder of the Nobel prize fund of \$9,200,000 (reduced by taxation to about \$8,400,000), the annual interest on which is yearly to be divided into five equal parts, to be distributed to the five most deserving persons in as many departments of human activity. Award is made for (a) the most important invention or discovery in physics; (b) the most important discovery or improvement in chemistry; (c) the most important discovery in physiology or medicine; (d) the most remarkable literary work of an idealistic nature; and (e) the most or best work done in the interests of universal peace. The first four prizes are awarded by the Acad-

mies of Sweden, the fifth by the Norwegian Storting. The first awards were announced on December 10, 1901: in physics, to Wilhelm Röntgen, of Munich University, Germany, discoverer of the Röntgen rays; in chemistry, to J. H. Van 't Hoff, of Berlin University, founder of a new system of stereo-chemistry; in physiology and medicine, to Emil Behring, of Marburg University, discoverer of anti-toxin for diphtheria; in literature, to Armand Sully-Prudhomme, of the French Academy, author of *Justice* (1878) and other poems, and *De l'expression dans les beaux-arts* (1884) and other prose works; in peace work, divided between Henri Dunant, prime mover of the Geneva Convention, and Frédéric Passy, founder of the Universal Peace Union.

NOBILITY (OF. *nobilite*, *nobilited*, Fr. *nobilité*, from Lat. *nobilitas*, nobility, from *nobilis*, noble, from *noscere*, to know; connected with Gk. γινώσκειν, *gignōskein*, Skt. *jñā*, to know, and ultimately with Eng. *know*). A class possessing by hereditary transmission social rank and privileges, and often political privileges as well, greater than those belonging to the mass of the people, and aristocracy of birth or privilege. In the most primitive societies, when the stronger and abler men became chiefs of tribes or clans there was frequently a body of supporters who acquired prestige from the power of their leader. The ancient empires—Egypt, Babylonia, Assyria—which had developed out of earlier tribal conditions, had a noble class, priests and warriors, surrounding and upholding the throne, except when the aristocracy became too strong and ambitious and overthrew the despot who trampled on its privileges. In the empires acquired by conquest the warriors who had shared success for the conqueror became through his gratitude or his necessity a special caste, above the conquered, and handed down to their descendants the privileges they had won. In more advanced stages of society wealth or political influence have often purchased rank for their possessors, and in the highest civilization intellectual ability has been rewarded by hereditary rank. There was another type of nobility in ancient Athens and Rome, where a population early in possession retained privileges above all other comers, forming at once parties and privileged orders in the State—the eupatrids and the patricians. Among the ancient Germanic tribes class distinctions went back to the beginnings of the race, for at our first knowledge of them they were divided into nobles, freemen, and slaves. The constant warfare of centuries had effaced these distinctions to a considerable extent at the time of the Germanic invasions. The nobility of the nations of modern Europe has its origin in the feudal aristocracy. See FEUDALISM.

The Frankish Kingdom in Gaul was divided into governments, each under the authority of a chieftain called a count or *comes*—a designation derived from the *comes* of the Roman Empire—whose Teutonic equivalent was *graf*, an official of the Crown in the time of Charles the Great, but acquiring in the later confusion hereditary rights. (See COUNT; GRAF.) A higher dignity and more extensive jurisprudence was conferred on the *dux* or duke (q.v.), a term also of Roman origin, and implying the duty of leading the armies of the country. In the Lombard Kingdom of Italy the same term was applied to the great officers who were intrusted with the military

and civil administration of cities and their surrounding provinces. The marquis (q.v.) was the guardian of the frontier marches. (See MARCH.) In the subinfeudations of the greater nobility originated a secondary sort of nobility, under the name of vavasours, castellans, and lesser barons; and a third order below them comprised vassals, whose tenure, by the military obligation known in England as a knight's service, admitted them within the ranks of the aristocracy. In France the allegiance of the lesser nobles to their intermediary lord long continued a reality; in England, on the other hand, William the Conqueror obliged not only his barons, who held in fief of the Crown, but their vassals also, to take an oath of fealty to himself; and his successors altogether abolished subinfeudation. (See BARON; KNIGHT.) In Continental Europe, the nobles, after the tenth century, assumed territorial names from their castles or the principal town or village on their demesne; hence the prefix *de*, or its German equivalent *von*, still considered over a great part of the Continent as the criterion of nobility or gentility. In England, on the contrary, many of the most distinguished family names of the aristocracy had no territorial origin. In the later Carolingian Empire the powerful nobles encroached more and more on the royal authority; and in course of time many of them openly asserted an independence and sovereignty with little more than a nominal reservation of superiority to the King. By the end of the ninth century the Empire had been parceled into separate and independent principalities, under the dominion of powerful nobles. During the entire history of the Holy Roman Empire the Crown never succeeded in vindicating its power against the feudal princes. In France the royal authority gradually revived under the Capetians, the great fiefs of the higher nobility being one by one absorbed by the Crown. In England the resistance of the nobles to royal encroachments was the means of rearing the great fabric of constitutional liberty. All those who, after the Conquest, held in *capite* from William belonged to the nobility. Such of them as held by barony (the highest form of tenure) are enumerated in Domesday. Their dignity was territorial, not personal, having no existence apart from baronial possession. The *comes* was a baron of superior dignity and greater estates; and these were in England the only names of dignity till the time of Henry III. The rest of the landholders, who held by other tenures than barony, also belonged to the nobility or gentry.

After the introduction of heraldry, and its reduction to a system, the possession of a coat of arms was a recognized distinction between the noble and the plebeian. On the Continent the term noble still generally refers to those to whom or their ancestors arms have been granted. In England it is now more common to restrict the words noble and nobility to the five ranks of the peerage constituting the greater nobility, and to the head of the family, to whom alone the title belongs. Gentility, in its more strict sense, corresponds to the nobility of Continental countries.

The higher nobility, or nobility in the exclusive sense, of England, consists of the five temporal ranks of the peerage—duke, marquis, earl, viscount, and baron (in the restricted significa-

tion of the word), who are members of the Upper House of Parliament. See PARLIAMENT.

The once powerful feudal nobility of France had been reduced in the time of Louis XIV. to a mere aristocracy of courtiers through the steady growth of the royal power. Immediately before the Revolution 80,000 families claimed nobility, many of them of obscure station, and less than 3000 of ancient lineage. The Revolution overthrew all distinction of rank. On June 18, 1790, the National Assembly decreed that hereditary nobility was an institution incompatible with a free State, and that titles, arms, and liveries should be abolished. Two years later the records of the nobility were burned. A new nobility was created by the Emperor Napoleon I. in 1808, with titles descending to the eldest son. The old nobility was revived at the Restoration. All marquises and viscounts are of pre-Revolution titles, none having been created in later times.

Commercial pursuits have in different countries been considered more or less incompatible with nobility. In England this was less the case than in France and Germany, where for long a gentleman could not engage in any trade without losing his rank. A sort of commercial 'Bürger-Adel,' or half-gentleman class, was constituted out of the patrician families of some of the great German cities, particularly Augsburg, Nürnberg, and Frankfurt, on whom the emperors bestowed coats of arms. (See FUGGER; WELSER.) In semi-feudal Italy there was on the whole less antagonism between nobility and trade than north of the Alps. The aristocracy of Venice had its origin in commerce; and though untitled, they were among the most distinguished class of nobles in Europe. On the other hand, in Florence, in the fourteenth century, under a constitution purely mercantile, nobility became a disqualification from holding any office of the State. In order to be admitted to the enjoyment of political honors the nobleman had to be struck off the rolls of nobility; and an unpopular plebeian was sometimes ennobled in order to disfranchise him. A little later there grew up, side by side with the old nobility, a race of plebeian nobles—as the Ricci, the Medici—whose pretensions were originally derived from wealth, and who eventually came to be regarded as aristocrats by the democratic party.

In Spain the term *hidalgo* (*kijo d'algo*, son of somebody, not *filius nullius*) indicates nobility. The *hidalgo* alone has in strictness a right to the title *don*, which, like *sir* of the British knights and baronets, requires the adjunct of the Christian name. When the Christian name is omitted the title *señor* instead is prefixed with the addition of *de*. Members of the higher nobility bear the title of *grandee* (q.v.); formerly the title was *rico-hombre*, and the ceremonial of creation consisted in granting the right of assuming the pennon and caldron (*peñón y caldera*)—the one the rallying ensign of command, the other of maintenance of followers. In contradistinction to the *grandees*, the class of nobility below them are called *los titulados de Castilla*.

In Russia what nobility existed before Peter the Great was of a patriarchal, not a feudal, kind (see BOYAR), but, in his anxiety to assimilate everything to a Western standard, the Czar took the existing aristocracies of States quite differently situated as the model to which

to approximate the fortunate of his own subjects. Consult: Méneſtrier, *Les diverses espèces de la noblesse* (Paris, 1683); id., *Le blason de la noblesse* (ib., 1683); Escherny, *Essai sur la noblesse* (ib., 1814); Duvergier, *Mémoires historiques de la noblesse* (ib., 1839-40); Magny, *Le nobiliaire des maisons nobles de l'Europe* (ib., 1854-94); Kotzebue, *Vom Adel* (Leipzig, 1792); Laine, *Noblesse de France* (Paris, 1825-50); Langlois, *Les origines de la noblesse en France* (ib., 1902); Cerini, *La noblesse allemande et ses origines* (ib., 1899); Stranz, *Geschichte des deutschen Adels* (new ed., Waldenburg, 1851); Rose, *Der Adel Deutschlands* (Berlin, 1883); Vehse, *Geschichte des österreichischen Hofes und Adels* (Hamburg, 1851); Gneist, *Adel und Ritterschaft in England* (Berlin, 1853); Lawrence, *On the Nobility of the British Gentry* (London, 1824; 4th ed. 1840).

NOBLE, nɒbəl, ALFRED (1844—). An American civil engineer, born at Livonia, Wayne County, Mich. He served during the Civil War in the Army of the Potomac (1862-65), graduated at the University of Michigan in 1870, and in that year began practice as a civil engineer. From 1882 he devoted his attention to bridge engineering. He was resident engineer of the Washington Bridge, New York City, the Cairo (Ill.) Bridge over the Ohio, and the Memphis (Tenn.) Bridge over the Mississippi; and assistant chief engineer of the bridges over the Missouri at West Alton (Mo.), and Leavenworth (Kan.), and over the Mississippi at Alton (Ill.). In 1895 he was appointed a member of the Nicaragua Canal Board, from 1897 to 1899 was a member of the United States Board of Engineers of deep waterways, to make surveys and prepare plans and estimates in connection with a ship-canal route from the Great Lakes to the Atlantic seaboard, and from 1899 to 1901 was on the Isthmian Canal Commission. He became president of the Western Society of Civil Engineers in 1898. His writings include papers contributed to the *Proceedings* of the Chicago Academy of Sciences, and of the Western and American Societies of Civil Engineers.

NOBLE, Sir ANDREW (1832—). A Scottish physicist and artilleryman, born at Greenock and educated at the Edinburgh Academy and the Royal Military Academy, Woolwich. In 1858 he was appointed secretary to the Committee on Rifled Cannon, and to the Plates and Guns Committee in 1859, when he was also made assistant inspector of artillery. In 1860 he left the public service to enter that of Sir W. G. Armstrong at the Elswick Arsenal. There he had wider opportunities for experimental research, and his invention of the chronoscope in 1862, which made possible the measurement of the initial velocity produced by various powders, led to an increase in the substitution of rifles for smooth-bores. In 1900 Captain Noble was a member of the committee appointed by the Government to inquire into the properties of smokeless powder. Besides foreign honors, he received the Royal Society medal in 1880, was knighted in 1893, and made a baronet in 1902.

NOBLE, FREDERICK ALPHONSO (1832—). An American Congregational clergyman, born in Baldwin, Me. He graduated at Yale in 1858 and at Andover Theological Seminary in 1861. His first pastoral charge was in Saint Paul,

Minna, where he remained for six years. After occupying churches in Pittsburg, Pa., and New Haven, Conn., he was called to the Union Park Church, Chicago, in 1879, and preached there until his resignation in 1901. His publications include: *Divine Life in Man* (1896); *Discourses on Philippians* (1897); and *Our Redemption* (1898).

NOBLE, JOHN WILLOCK (1831—). An American lawyer and Cabinet officer, born at Lancaster, Ohio. After a year at Miami University, he entered Yale, where he graduated in 1851. He then studied law at Columbus and Cincinnati, removed to Saint Louis in 1855, and a year later settled in the practice of his profession at Keokuk, Iowa. There he took a prominent part in politics, and in 1859-60 was city attorney. In 1861 he enlisted in the Third Iowa Volunteer Cavalry as a private, gradually rose to the rank of colonel, and was brevetted brigadier-general at the close of the war. Settling again at Saint Louis after the war, he was United States District Attorney for the eastern district of Missouri from 1867 to 1870. He was Secretary of the Interior in the Cabinet of President Harrison from 1889 to 1893, after which he resumed his law practice in Saint Louis.

NOBLESVILLE, nō'b'ls-vil. A city and the county-seat of Hamilton County, Ind., 22 miles north by east of Indianapolis; on the White River, and on the Chicago and Southeastern and the Lake Erie and Western railroads (Map: Indiana, C 2). It is the centre of an agricultural section, and has a valuable supply of natural gas. Among its industrial establishments are a strawboard mill, foundries, enameling works, carbon works, flouring mills, grain elevators, etc. Settled in 1824, Noblesville was incorporated first in 1839. The government is administered under a charter of 1890, which provides for a mayor, elected every four years, and a unicameral council. Population, in 1890, 3054; in 1900, 4792.

NO-BODY CRAB, or **SEA-SPIDER**. See **PANTOPODA**.

NOBUNAGA, nō'bōō-nā'gā (1533-82). A Japanese soldier and ruler, who brought order out of anarchy in the latter half of the sixteenth century. Born of an humble family, he was free from the hatreds and jealousies of the nobles, and won his way by his own powers as an intrepid and skillful soldier. He was victorious in many contests, and, notably, he humbled the militant Buddhist priests, destroying two strongly fortified monasteries and putting the monks to the sword. Buddhism never regained its political power. As an aid in the contest with Buddhism he welcomed the Jesuit missionaries, his own son becoming a Christian. But his favor was wholly for political purposes. Nobunaga was a jovial, pleasure-loving man, a patron of the fine arts and of wrestling. His private life was stained not only by the vices common to the military men of his age, but by treachery. In consequence of his failure to respect a pledge given by one of his lieutenants he was assassinated, his murder being speedily avenged. In a desperate age Nobunaga began the work which was carried to its completion by his greater successors, Hideyoshi (q.v.) and Iyeyasu (q.v.). Consult: Brinkley, *Japan* (Boston, 1901); Griffis, *The Mikado's Empire*, new ed. (New York, 1883).

NOCERA DE' PAGANI, nō-chā'rā dā pā-gā'nā. A city in Italy. See **NOCERA INFERIORE**.

NOCERA INFERIORE, en'fā-rē-ō'rā, or **NOCERA DE' PAGANI**. A city in the Province of Salerno, Italy, 20 miles east by south of Naples by rail (Map: Italy, F 11). It is the see of a bishop, has a cathedral, ruins of a castle, formerly an Angevine stronghold, and large modern factories of linen and woolen goods. The town was the ancient Nuceria Alfaterna, destroyed by Hannibal in 216 B.C., but rebuilt by Augustus. Population (commune), in 1881, 15,858; in 1891, 19,796.

NOCTES AMBROSIAŊÆ (Lat., ambrosial nights). The name of a long series of critical, political, and poetical disquisitions in dialogue published in *Blackwood's Magazine* from 1822 to 1835, purporting to be the word-for-word report of the meetings at Ambrose's Tavern, Edinburgh, and elsewhere, of several of the literary celebrities of the day. For the first three years they were the work of many hands, but after 1825 they were mostly by 'Christopher North,' John Wilson (q.v.). The scheme was evidently taken from the symposia of the ancients. The *Noctes* had an immense vogue, but they are now little read. Their great creation is the character of the Ettrick Shepherd, an idealized portrait of James Hogg (q.v.).

NOCTILUCA (Lat., that which shines by night). An enormous monad-like form representing the order Cystoflagellata, of the class Mastigophora (q.v.). It is a highly phosphorescent organism, so small as to be scarcely seen with the naked eye, being from $\frac{1}{4}$ to 1 mm. (.01 to .04 inch) in diameter, and occurs in great numbers on the surface of the sea, including American harbors. It has a nearly spherical, jelly-like body, with a groove on one side, from which issues a curved filament or flagellum, used in locomotion. Near the base of this flagellum is the mouth, having on one side a tooth-like projection. Connecting with the mouth is a short esophagus or gullet, which passes into the digestive cavity, in front of which lies a nucleus. Beneath the outer skin or firm membrane surrounding the body is a gelatinous layer, containing numerous granules. The young result from a division or segmentation of the entire mass of the protoplasm of the body, forming small oval bodies with a long lash. The germs or zoöspores are somewhat like those of other flagellate infusoria, but very unlike the adult.

The only other representative of this order is *Leptodiscus medusoides*, which darts through the water by the contractions of its umbrella-shaped body. It was discovered at Messina, but has not yet been detected in American waters.

NOCTUIDÆ (Neo-Lat. nom. pl., from Lat. *noctua*, night-owl, from *nox*, night). A large and important family of moths, containing all of those forms known as owl moths (q.v.). Their larvæ include the cutworms (q.v.).

NOCTURNE, nōk-tŭrn' (Fr., night piece). The name given by John Field (q.v.) to a composition of a soft, dreamy character somewhat free in form. The greatest master of the nocturne is Chopin, who has filled this form with the loftiest contents.

NODDY (probably from *nod*, OHG. *anoton*, *nuoton*, dialectic Ger. *notteln*, to shake). A brownish black tern (*Anous stolidus*) widely

diffused in both hemispheres, and familiar to sailors, as it not infrequently alights on vessels, and suffers itself to be taken by the hand. At its breeding-places also, where not accustomed to the visits of man, it scarcely gets out of the way; and the female sits undisturbed on the nest; hence it commonly shares with the booby the reputation of unusual stupidity. The noddy is rare in the North Atlantic, but very abundant in warmer latitudes, and on some of the keys of the West Indies breeds in immense numbers, and the eggs are collected as food.

NODE (from Fr. *node*, from Lat. *nodus*, knot). A small, circumscribed swelling which occurs upon the surfaces of the bones of the head and extremities. Nodes are nearly always due to syphilis.

Another variety of node occurs in one form of arthritis deformans, and is called Heberden's *nodosities*. These bony tubercles appear upon the dorsal and lateral surfaces of the terminal phalanges of the fingers, and are incurable. They are most common in women and neurotic persons.

NODE. An astronomical term used in connection with planetary orbits. If we disregard certain small perturbations (q.v.) of planetary motion, we may say that each planet moves in an elliptic curve, having the sun in one of its foci. This curve lies in a plane called the plane of the orbit; and in the case of the earth this orbital plane is called the plane of the ecliptic. Now, if these orbital planes are imagined extended to the celestial sphere, they will cut out upon it great circles, one corresponding to each orbital plane. Such a great circle cut out by the plane of the earth's orbit is called the ecliptic (q.v.). If we consider the ecliptic and the corresponding great circle belonging to any other planet, we shall find that they intersect at two points on opposite sides of the celestial sphere. These two points, in the case of any planet other than the earth, are called the *nodes* of its orbit.

Thus all the planetary nodes lie on the ecliptic circle; and the position of any node is given by stating its celestial longitude. (See **LATITUDE AND LONGITUDE**.) This longitude of the node is one of the elements (q.v.) of a planet's orbit. Since the two nodes are directly opposite one another, their longitudes must differ by exactly 180°, so that the longitude of the one being given, that of the other is known also. By common consent, astronomers select that one of the nodes whose longitude is to be given as an element of the orbit as the *ascending* node. This is the node corresponding to the passage of the planet from the south side of the ecliptic to the north side in the course of its orbital revolution around the sun. The other node is called the *descending* node.

The effect of planetary perturbations (q.v.) is to cause the nodes to move backward on the ecliptic. The rate of motion is very slow, the most rapid being in the case of Uranus, whose node will travel once around the ecliptic in 37,000 years, while that of Mercury will consume 166,000 years in a single revolution.

NODE, NODAL POINTS. When a string or metallic cord, under strong tension, is made to vibrate, there are heard besides the principal sound secondary and shriller sounds, which are denominated overtones or harmonic sounds, and are pro-

duced by a certain portion of the cord vibrating independently. Investigation shows that every vibrating string is divided into a number of segments vibrating independently, and that the points which separate these portions from each other are at rest. These points are known as *nodal points*, and their situation may be found by placing small pieces of paper on a stretched string, and causing it to vibrate. When a string vibrating to its fundamental note, that is as a unit, is touched at its middle point with a feather, it will immediately resolve itself into segments of equal length vibrating twice as rapidly. The point where the string is touched with the feather being at rest would accordingly form a node, while the vibrating portions would be known as ventral segments. Chladni discovered that if a plate of glass or metal be clamped at the centre and then be touched by the finger at some middle point on one of the sides, and a well-resined fiddle bow be drawn across the edge, particles of fine dust or sand previously placed on the plate will arrange themselves in lines, showing that along these lines no vibration has taken place; these lines are *nodal lines*, and are found in most cases to group themselves together into geometrical figures, and occasionally to present the most beautiful designs. (See **CHLADNI FIGURES**.) The arrangement of the nodal lines depends on the point at which the plate is touched, and on the form of the plate itself. Similarly, a column of air vibrating in an open or closed organ pipe will divide itself into portions each in a state of vibration, and separated from one another by transverse sectional portions in which the air is at rest; these latter sections are known as *nodal sections*. In the open pipe the node is at the centre of the pipe, while in the closed pipe the node is at the end. See **ACOUSTICS**.

NODIAK (Papuan name). The Papuan spiny ant-eater. See **ECHIDNA**.

NODIER, nō'dyā', CHARLES (1780-1844). A French philologist, novelist, poet, and critic, born at Besançon, April 29, 1780. He studied at Strassburg. In 1802 he published *Stella ou les proscrits*, a novel after the manner of Rousseau, and in 1803 *Le peintre de Salzbourg*, inspired by Goethe's *Werther*. In 1804 appeared *Essais d'un jeune barde*; in 1815 the *Histoire des sociétés secrètes de l'armée*. *Trilby ou le Lutin d'Argail* came out in 1822, and the Romantic School began to gather about Nodier in the salon of the Arsenal toward 1823. Nodier, like most of the romantic writers, is in love with the sensational, exotic, and fantastic, and is fond of turning history into romance. In 1830 he put forth the *Roi de Bohême et ses sept châteaux*, and in 1832 *La fée aux miettes*, a fairy tale. In 1834 he became an Academician, ten years after he had been made director of the Library of the Arsenal. He died in Paris, January 26, 1844. Nodier outgrew his sentimentalism, and became through his *Jean Sbogar* (1818), *Rutwen* (1820), *Smarra* (1821), and *Trilby*, the herald of romantic fiction in France. *Bertram ou le château de Saint-Aldebrand*, a tragedy, shows English influence, particularly that of Sir Walter Scott. His versatility is shown by his publication in 1808 of a *Dictionnaire raisonné des onomatopées* (2d ed. 1828) and by his *Dictionnaire universel de la langue française* (1823). An edition in twelve volumes of his *Œuvres* appeared in 1832-34. Con-

sult Mme. Menessier-Nodier, *Charles Nodier, épiques et souvenirs de sa vie* (Paris, 1867).

NODULAR DISEASE (from Lat. *nodulus*, diminutive of *nodus*, joint). A disease due to the presence of a roundworm (*Æsophagostoma columbianum*) in the intestinal walls of sheep, which has often been mistaken for tuberculosis of the intestines. Positive diagnosis can be made only after death. Affected animals become anemic and debilitated, the wool becomes dry, and there may be profuse diarrhoea. The larger tumors will be found to contain the small nematode worm, surrounded by a greenish, cheesy mass. The adult worm is found free in the large intestine.

NOË, nò'á', AMADÉE DE. A French caricaturist. See his pseudonym, **CHAM**.

NOEL, nò'él, BAPTIST WRIOTHESLEY (1798-1873). An English clergyman. He was born at Leightmount, Scotland, and educated at Westminster and Trinity College, Cambridge. He studied first for the bar, but abandoned this profession for the Church of England. In 1827 he became minister of Saint John's Chapel, Bedford Row, London, where his eloquence won for him a large congregation from the upper classes, and he assumed a place of leadership among the preachers of evangelical tendencies. In 1846 he assisted in organizing the Evangelical Alliance. During the Gorham controversy (q.v.) of 1848-50, Noel withdrew from the Established Church and entered the Baptist denomination, at the same time publishing his grounds for so doing in an *Essay on the Union of Church and State* (1848). Later he published an *Essay on the Act of Baptism* (1850). A permanent contribution to the subject of American affairs was *Freedom and Slavery in the United States of America* (1863).

NOETIANS, nò-é'shans. See **PATRIPASSIANISM**.

NOËTIC CONSCIOUSNESS (Gk. *νοητικός*, *noëtikos*, relating to perception, from *νόησις*, *noësis*, perception, from *νοεῖν*, *noein*, to perceive, from *νός*, *noos*, *νός*, *nous*, perception, mind; probably connected with *γινώσκειν*, *gignóskein*, to know, and ultimately with Eng. *know*). It is affirmed by many psychologists that the essential characteristic of mental process is its reference, beyond itself, to some object; so that the only possible criterion of the ultimateness and irreducibility of a mental function is the irreducibility of the mode in which it thus refers to its object. Brentano distinguishes between ideation (or noetic consciousness), judgment or belief, and interest or liking. Stout, however, has recently raised the question whether it is possible for a sentient being to exist entirely devoid of thought, i.e. to possess an anoetic consciousness. To such a consciousness the antithesis of subject and object would be meaningless; while there would seem to be no road from mere sentience to thought by any process of differentiation or complication. Stout leaves the question unanswered, except in so far as the two difficulties just raised appear to prevent, for him, any genetic passage from an anoetic to a noetic mind. The problems raised are of special interest to the epistemologist and the student of the evolution of mind. The term noetic has had a long history in psychology. Plato distinguishes be-

tween a noetic or incorporeal world of concepts, and an æsthetic or corporeal world of perceptions, the latter being but an image of the reality of the former. Aristotle uses the word in the sense of 'capable or rational apprehension.' Hamilton employs it to "express all those cognitions that originate in the mind itself," while "dianoetic denotes the operations of the discursive, elaborative, or comparative faculty." Stout restricts the phrase 'noetic synthesis' to "that union of presentational elements which is involved in their reference to a single object; or, in other words, to their combination as specifying constituents of the same thought." Consult: Stout, *Analytic Psychology* (London, 1896); Brentano, *Psychologie vom empirischen Standpunkte* (Leipzig, 1874); Sir W. Hamilton, *Lectures on Metaphysics*, vol. ii. (London, 1859).

NOGALES, nó-gá'lás. A frontier town of Mexico, situated on the boundary of Arizona and on the Santa Cruz River (Map: Mexico, D 2). It is a station on the Sonora Railroad, and is the seat of a United States consul. Population, in 1901, 2738.

NOGENT-SUR-MARNE, nó-zhán'sur-márn'. A town of France, in the Department of Seine, situated on a bend of the Marne, three miles east of Paris, to the east of the Forest of Vincennes. The Eastern Railroad from Paris here crosses the valley of the Marne on a long, curving viaduct. The town contains numerous fine villas, and has manufactures of pottery and chemicals. Population, in 1901, 10,391.

NOHL, nöl, LUDWIG (1831-85). A German musical lecturer, scholar, and writer. He was educated for the law, but subsequently followed the profession of music. He studied under Dehn and Kiel, and in 1860 became lecturer at Heidelberg. He held several other important university and conservatory appointments, and toward the close of his life settled in Heidelberg as a lecturer at the university. His writings are standard, and have been translated into both French and English. They include: *Beethovens Leben* (1864-77); *Briefe Beethovens* (1865); *Mozarts Briefe* (1865); *Beethoven, Liszt, Wagner* (1874); and *Beethoven nach den Schilderungen seiner Zeitgenossen* (1880).

NOILS (OF. *noiel*, *nuiel*, button, buckle, *neuel*, stone of a fruit, Fr. *noyau*, kernel, from Lat. *nux*, nut, or possibly a diminutive of OF. *nou*, knot, from Lat. *nodus*, knot). The short and broken hairs which are removed from wool in the process of combing and preparing it for worsted manufactures. The noils are used for making inferior yarns, and are valuable for felting purposes, in which they are largely employed.

NOIRÉ, nwá'rá', LUDWIG (1829-89). A German philosophical writer, born at Alzey, in Hesse. From 1846 to 1848 he pursued his studies at Giessen, after which he became a teacher at the gymnasium in Mainz. His study of the works of Spinoza, Schopenhauer, Lazarus Geiger, and the modern naturalists led him to the effort to construct a system of monistic philosophy according to which the universe is a single reality of which sensation and motion are the two aspects. In 1874 he published *Die Welt als Entwicklung des Geistes*. This was followed by *Der monistische Gedanke. Eine Konkordanz der Philosophie Schopenhauers, Darwins, Robert Meyers,*

und L. Geigers (1875). He also wrote the preface to Max Müller's English translation of Kant's *Kritik der reinen Vernunft*, which is a sketch of the history of philosophy; *Der Ursprung der Sprache* (1877); *Die Doppelnatur der Kausalität* (1876); and *Einleitung und Begründung einer montistischen Erkenntnistheorie* (1877).

NOISSEVILLE, nwa'svél'. A village of Lorraine, about 4 miles east of Metz, noted as the scene of a battle fought between the French under Bazaine, numbering about 120,000 men, and an army of 40,000 Germans, August 31-September 1, 1870. Hoping to break the German cordon around Metz and effect a junction with the army of MacMahon, Bazaine transported his forces to the right bank of the Moselle, and by a fierce attack succeeded in taking the villages of Montoy, Courcy, and Servigny. The Germans rallied toward the evening and recaptured Servigny. Fighting was resumed on the following day, and resulted in the retreat of the French across the river.

NOLA, nò'la. A city in the Province of Caserta, Italy, 15 miles east-northeast of Naples by rail (Map: Italy, J 7). It is the see of a bishop. The cathedral, dating from the fifteenth century, was partly destroyed by fire in 1870. The seminary near by has interesting antique inscriptions. The ancient Nola fell into the hands of the Romans in the Samnite war, B.C. 313. The town held out against Hannibal in the Second Punic War. Augustus died at Nola A.D. 14. The first bells for Christian churches are said to have been cast here in the fifth century. Numerous coins, and beautiful vases which anciently were made here, and other antiquities have been found in the vicinity. Population (commune), in 1881, 11,931; in 1901, 14,622.

NÖLDEKE, nöl'de-ke, THEODOR (1836—). A distinguished German Orientalist. He was born in Harburg and pursued his university studies chiefly at Göttingen, where in 1861 he became privat-docent. In 1864 he was made extraordinary professor at Kiel and in 1868 full professor. In 1872 he became professor of Semitic philology in Strassburg. Nöldeke is the leading authority in general Semitic philology. Among his works may be mentioned *Geschichte des Korans* (1860); *Das Leben Mohammeds* (1863); *Die alttestamentliche Litteratur* (1868); *Grammatik der neu-syrischen Sprache* (1868); *Untersuchungen zur Kritik des alten Testaments* (1869); *Die Inschrift des Königs Mesa von Moab* (1870); *Mandäische Grammatik* (1874); *Geschichte der Perser und Araber zur Zeit der Sasaniden* (1879); *Kurzgefasste syrische Grammatik* (1880); *Die semitischen Sprachen* (1887); *Aufsätze zur persischen Geschichte* (1887); *Delectus Veterum Carminum Arabicorum* (with A. Müller, 1890); *Orientalische Skizzen* (1892). He wrote besides several hundred contributions to encyclopædias and magazines and many valuable reviews, chiefly in the organ of the *Deutsche morgenländische Gesellschaft* and *Litterarisches Centralblatt*.

NOLHAC, nò'lák', PIERRE DE (1859—). A French historian, born at Ambert, Puy-de-Dôme. He received his early education in Paris, and was a student at the French school in Rome (1882-85). On his return he received the degree of doctor of letters and studied at the Bibliothèque Nationale for a year, when he was made professor at the Ecole des Hautes Etudes. His contribu-

tions to the history of Italian literature and of the French Renaissance are specially valuable. His works include: *Le dernier amour de Ronsard* (1882), an edition of the *Lettres de Joachim du Bellay* (1883); *Le "Canzoniere" autographe de Pétrarque* (1886); *La bibliothèque de Fulvio Orsini* (1887); poems entitled *Paysages d'Auvergne* (1888); *Érasme en Italie* (1888); *Mario-Antoinette* (1890); *Le château de Versailles sous Louis XV.* (1898); and *Histoire du château de Versailles* (1899). In 1892 M. Nolhac was made director of the National Museum at Versailles.

NOLI ME TAN'GERE (Lat., Touch me not). The words spoken by the risen Christ to Mary Magdalene, used as the title of a number of paintings, including those by Titian in the National Gallery, London, and by Rembrandt in Buckingham Palace.

NOLL. A popular name for Oliver Cromwell.

NOLLEKENS, JOSEPH (1737-1823). An English sculptor. He was born in London, August 11, 1737, the son of a painter. In 1750 he studied sculpture with Peter Scheemakers, and as the winner of several prizes offered by the Society of Arts, was enabled in 1760 to start for Rome. A portrait bust of Garrick was followed by a bust of Sterne and others. While at Rome he supported himself by taking active part in the traffic and restoration of antiquities. In 1770 he settled in London, where he was made a member of the Royal Academy in 1772. His portrait busts are good likenesses, and he displayed skill in the treatment of his draperies. His portraits include busts of George III., Prince and Princess of Wales, Duke and Duchess of York, Oliver Goldsmith, Dr. Johnson, and Warren Hastings, the statue of Pitt in Cambridge, the sepulchral monument of the "Three Captains," Westminster Abbey, and of Mrs. Howard, Corby Church, Cumberland. Of his ideal statues the most popular are the so-called "Venuses," the best of which are "Venus Chiding Cupid," "Venus Anointing Her Hero," and the "Seated Venus," now at Petworth. Nollekens died in London, April 23, 1823.

NOLLE PROSEQUI (Lat., will not prosecute). An entry on the records of a court by the public prosecutor in a criminal case, or the plaintiff in a civil action, to the effect that the proceedings against the defendant shall be discontinued. This method of terminating legal proceedings originated in England during the reign of Charles II., and seems to have been devised as a convenient means of nullifying certain obnoxious statutes, by thus ending any prosecution under them. The practice was subsequently adopted into the civil procedure in England to enable a plaintiff to discontinue his action, but it was later superseded by the common-law nonsuit.

In the United States to-day the practice of entering a *nolle prosequi*, or *nol. pros.*, as it is usually called, is confined almost exclusively to criminal proceedings. The right to thus discontinue a criminal prosecution is a prerogative of the State, and it generally rests in the discretion of the prosecuting officer whether to exercise it or not; but where the case has proceeded to trial, by the general rule he should make a motion to the court for leave to do so. A *nol. pros.* entered after the jury has been sworn and trial commenced will operate as an acquittal and a bar

to any future prosecution for the same offense. (See JEOPARDY.) Under modern codes of civil procedure, the method of abandoning legal proceedings is by discontinuance, or by allowing a nonsuit; but in a few jurisdictions, where common-law pleading and practice still obtains, a *nolle prosequi* seems to be a permissible way of ending an action on the part of the plaintiff. See NONSUIT; PLEADING; PRACTICE.

NOMA. See CANCERUM ORIS.

NOM'AD (from Lat. *nomas*, from Gk. *νομάς*, roaming, from *νόμος*, *nemein*, to pasture, distribute). A term primarily applied to those peoples whose resources were chiefly flocks and herds. All the industries and conveniences of nomadic life grow out of this one fact. Grass and water are the chief essentials, hence nomads dwell always in regions where pasture is the best and water is not far to seek. Their habitations must admit of being transported from place to place, and hence consist of tents; their furniture is largely of skins; they clothe themselves in hides and woolen cloth. The saddle and harness, sleds and wagons, roads and land commerce, all spring out of the taming of horses, asses, cattle, sheep, goats, camels, and reindeer—the characteristic wealth of nomadic peoples.

NOMADA (Neo-Lat., from Gk. *νομάς*, *nomas*, roaming). A genus of bees typical of the family Nomadidae, including species which live parasitically in the nests of other bees and are called 'cuckoo-bees.' Often there is enough food both for the larvæ of the cell-maker and the larvæ of the cuckoo-bee, and both thrive and issue simultaneously as adults. The larva is smooth, tapering toward each end, and has a small head. The pupa has three conspicuous spines on the upper and posterior edge of the orbit, which seem to aid in locomotion. See CUCKOO-BEE.

NO MAN'S LAND. (1) A region 170 miles in length and about 35 in width, north of Texas, ceded to the United States in 1850 and made a part of Oklahoma in 1890. Between those years the district was under no form of government, and became a resort of outlaws.

(2) A narrow district on the line between Delaware and Pennsylvania. Although it is held to belong to Pennsylvania, some of the inhabitants perform their legal obligations in Delaware, while others do not recognize their citizenship in either State.

NOMARCHY, or **NOME.** The largest administrative division of Greece. Since 1899 the nomarchies have numbered twenty-six. They are subdivided into eparchies, which in turn are made up of demarchies. The administration of the nomarchy is in the hands of a nomarch, appointed by the Government for an indefinite term. His duties are much like those of the French prefect. Like him, he is assisted by a council elected by universal suffrage, but for a fixed term. The eparchy corresponds to the French *arrondissement* and the demarchy to the commune.

NOME (Lat. *nomus*, from Gk. *νόμος*, *nomos*, province, district, from *νόμος*, *nemein*, to pasture, distribute). The name given by the Greeks to the provinces or districts into which Egypt was divided, from the earliest historical period down to the time of the Roman dominion. It is probable that the nomes were the remains of small

independent States, which in very early times were united under a single monarchy. Each nome possessed its own god or group of gods, worshiped in the local temple, as also its own myths and religious traditions. The government of the nome was a copy, in miniature, of that of the State. At the head stood the nomarch, or governor, and under him was a regular gradation of officials, each responsible to his immediate superior. In the earlier period, each nome had its own treasury, its own courts of justice, and its own military establishment. Under the feudal system of the Middle Empire, the nomarchs were the heads of ancient noble families, and were prompt to take advantage of any weakness in the Central Government to make themselves practically independent princes. The old nobility was, however, extinguished in the Hyksos wars, and from the time of the New Empire the nomes were purely administrative districts ruled by royal governors, who still bore the title of nomarchs. In the time of the Ptolemies the chief officer of the nome was the strategos, under whom the nomarch was a subordinate official charged with supervising the collection of taxes and other financial matters. In general there were some 42 nomes, 22 in Upper and 20 in Lower Egypt, but the number was not invariable. So far as is at present known, the number of the nomes never fell below 36, nor exceeded 47. Consult: Duemichen, *Geschichte des alten Aegyptens* (Berlin, 1878); Budge, *A History of Egypt* (New York, 1902); Brugsch, *Geographie des alten Aegyptens* (Leipzig, 1857); *Dictionnaire géographique de l'ancienne Egypte* (Leipzig, 1879-80); Egypt Exploration Fund, *An Atlas of Ancient Egypt* (2d ed., London, 1894).

NOME. A term used in the ancient Greek music to denote any melody determined by inviolable rules.

NOME, *nom*. The largest city of Alaska, in the Northern District; situated at the mouth of the Snake River, 13 miles west of Cape Nome, on the north shore of Norton Sound, Bering Sea (Map: Alaska, C 3). It is the centre of the productive Cape Nome gold-mining district, which extends west along the coast for about 20 miles from Cape Nome. In the fall of 1898 the small streams in the vicinity were prospected with promising results, and in the following summer the creek diggings were being actively operated when the news of the rich beach deposits, first discovered in January, 1899, though their importance remained unrecognized until July, caused a rush to the beach, where about 2000 men were working by October. The output of the district for 1900 was more than \$5,000,000, and in 1901 it was estimated at \$7,000,000. During this period a 'mushroom' settlement of tents, first called Anvil City, had sprung up. This town was gradually replaced by a permanent city of frame structures after the arrival in June, 1899, of the first consignment of lumber. In the early days the matter of food and fuel supplies was a source of great anxiety; and the unsanitary conditions due to the level and undrained site of the town, its scanty water-supply, and the climatic changes resulted in considerable sickness. There now exists a fully organized city, compactly built over half of its length along the beach, with a municipal government, fire and police departments, sewerage, water, and electric-

light systems, telephone service, etc.; and with a number of substantial commercial buildings, banks, commercial organizations, a court house, and a post office, hospitals, clubs, etc. A railroad extends from the coast to the mining claims at the foot-hills of the mountains. Population, in 1900, 12,488.

NOME, CAPE. See **CAPE NOME**.

NOMENCLATURE, SCIENTIFIC. See **CLASSIFICATION OF ANIMALS**.

NOMINALISM (from *nominal*, from Lat. *nominalis*, relating to names, from *nomen*, name; connected with Gk. *ὄνομα*, *onoma*, Skt. *nāman*, OChurch Slav. *ime*, OIr. *ainm*, Goth. *namō*, OHG. *namo*, Ger. *Name*, AS. *nama*, Eng. *name*). The philosophical theory that only individual objects have real existence, and that so-called universals (see **JUDGMENT**) are nothing but names given in common to actually different and incommunicable objects. These names were considered as nothing but so much breath (*flatus vocis*), without indicating any real identity in the objects sharing in identical names. This view was an extreme development of the Aristotelian doctrine that all reality is individual, and that universals have existence only in individual objects; and it was called forth by the extreme Neo-Platonism of Erigena, who maintained that universals have an existence prior to particulars and individuals, and that the process of creation is only the progressive, logical differentiation of the universal. This Neo-Platonic view of the relation of the universal and the particular is called *realism*, and was advocated by Bernard of Chartres, Guillaume de Champeaux (q.v.), and Walter of Mortagne. Nominalism, on the contrary, was maintained by Roscelinus (q.v.). Abélard represented a modified nominalism in maintaining that the universal is not a real objective existence, nor, on the contrary, a mere word (*vox*), but the meaning of the word. This view, which is called sermonism (from *sermo*, which in scholastic Latin meant 'predicate'), is a type of conceptualism (q.v.) peculiar to Abélard, and is to be distinguished from other forms of conceptualistic doctrine in that it did not point expressly to the fact that meanings are mental facts. With Abélard meanings seemed to reside in words, not as *words*, but as predicates of propositions. The Arabian philosophers, and especially Avicenna (q.v.), succeeded in mediating between nominalism and realism by maintaining that universals are before individuals (realism) in the mind of God, in individuals (Aristotelianism) as their developed essence, and after individuals (nominalism) in human minds (conceptualism). This was the view adopted by Thomas Aquinas (q.v.) in his system and so incorporated in the received philosophy of the Roman Church. Nominalism received its last strong support in the teaching of William of Occam (q.v.) in the fourteenth century; but the influence of this revival was transitory, coming as it did upon the eve of the Renaissance and the general decline of interest in scholastic problems. See Löwe, *Der Kampf zwischen Nominalismus und Realismus im Mittelalter: sein Ursprung und sein Verlauf* (Prague, 1876); also the histories of philosophy by Ueberweg-Heinze, Windelband, Erdmann.

NOMINATION (Lat. *nominatio*, from *nominare*, to name, from *nomen*, name). In politics,

the formal selection and presentation of a candidate for an elective office. In the United States, before the development of political parties, candidates for office were frequently nominated at private conferences or caucuses of the leading citizens of the community. Sometimes no formal nominations were made, and candidates were self-announced. By 1800 parties were fairly well organized, and the necessity arose of devising some means of selecting the candidates for offices. In national elections this was supplied by the Congressional caucus, which assumed the right of choosing Presidential and Vice-Presidential candidates, and of determining the policy of the party. (See **CAUCUS**; **CONVENTION**.) This method lasted until 1824. With the commencement of the revolt against the Congressional caucus several other temporary methods of nomination sprang into existence. These were nomination by the State legislatures as a whole, nomination by party caucuses of the State legislatures, nomination by State conventions, and nomination by public meetings. All these proved to be ineffectual and were superseded by the method of national convention, which came permanently into existence between 1830 and 1840, the first such convention being that of the Anti-Masonic Party in 1832. This has continued to be the accepted method of nominating candidates for President and Vice-President. Generally the choice of the convention is determined by the votes of a majority of the delegates; but in the case of the Democratic Party a two-thirds vote is necessary for a choice. In the nomination of State and local officers the convention has also come to be the recognized method, although in case of some of the minor offices nominations are frequently made directly by the party voters in the so-called primary elections. The national nominating convention consists of a certain number of delegates from each State, while local conventions are made up of delegates representing the several local units of the electoral district. The principle of representation according to the total population prevailing in both cases. Exceptions to the general rule that candidates for public office are nominated by delegate convention are, first, the old English method of self-announcement, which exists in communities like some of the Southern States, where practically only one political party exists, and where the success of the party is not endangered by a multiplicity of candidates; second, the method of nomination by primary election, where the individual voters directly select the candidate without the intervention of a convention; and, third, the method of nomination by petition, according to which the candidate may be put forward by filing with the proper officer a paper signed by a certain specified number of qualified voters. In those parts of the country where the New England town meeting exists, local candidates are frequently put in nomination by that assembly. In the cities local elective officers are almost invariably nominated by primary caucus or delegate conventions. Consult Dallinger, *Nominations for Elective Office in the United States* (New York, 1897); Bryce, *American Commonwealth*, vol. ii., chap. lxix.

NOMINATIVE CASE. See **DECLENSION**.

NOMOCANON (Gk. *νόμος*, *nomos*, law + *κανών*, *kanōn*, rule,

canon). In the Greek Church, the collection of ecclesiastical laws, both those proceeding from the Church (*canones*) and those from the State (*nomoi*). The first collection was made in the sixth century, but the most important in the fourteenth, the so-called *Synagma*.

NO NAME. A novel by Wilkie Collins (1862). It is the story of a prosperous English family, but it turns out that the parents have not been married. That having been finally done, before a new will can be drawn up, the father is killed by accident, the mother dies, and the illegitimate daughters are left destitute, in spite of their father's wealth. The purpose is to show the evils resulting from the English law on such cases.

NON-COMBATANTS (in War). Officers and men charged with the administrative duties of the military or naval services, who do not fight except in self-defense.

NON-COMMISSIONED OFFICER. A soldier holding a rank intermediate between that of the enlisted man or private soldier and the commissioned officer. The following classification gives the various non-commissioned grades of the United States Army in the order of their precedence: (1) Sergeant-major, regimental, and sergeant-major, senior grade, artillery corps; (2) quartermaster-sergeant, regimental; (3) commissary-sergeant, regimental; (4) ordnance sergeant, post-commissary-sergeant, post-quartermaster-sergeant, electrician sergeant, hospital steward, first-class sergeant signal corps, chief musician, chief trumpeter, and principal musician; (5) squadron and battalion sergeant-major, and sergeant-major, junior grade, artillery corps; (6) first sergeant and drum-major; (7) sergeant and acting hospital steward; (8) corporal. In each grade, date of appointment determines the order of precedence. See **CORPORAL**; **SERGEANT**; **STAFF**.

The non-commissioned officer of to-day must possess the ability to assume executive command in any emergency demanding prompt action and tactical ability; consequently only the most intelligent of the enlisted men are selected for promotion. United States Army regulations permit a certain proportion of non-commissioned officers to obtain commissions annually, and in other ways make the rank very desirable. In the English army, except in rare instances, social conditions preclude the possibility of any non-commissioned officer of humble birth attaining the commissioned rank as a combatant officer; for although commissions are granted as quartermasters, riding masters, and occasionally as officers in certain divisions of the artillery and in the engineers, they are only given after a lifetime of service, and are to all intents and purposes honorary positions. During the Boer War of 1899-1902 the heavy casualties among officers made it necessary in many instances to admit qualified non-commissioned officers to the commissioned ranks, apart from any family or social consideration—and it is expected that this initiative will lead to an order of things similar to that of the United States Army. In Italy nearly one-third of the officers of each arm of the service are taken from the non-commissioned ranks. (See **MILITARY EDUCATION**.) The German army system, as also that of France,

makes special provision for the training of non-commissioned officers.

NON COMPOS MENTIS (Lat., not having power over the mind). A legal term for lunacy. See **INSANITY**.

NONCONFORMISTS (from *non*, not + *conformist*, from Lat. *conformis*, similar, from *com*, together + *forma*, form). A name given generally to those who do not conform to the religion of an established Church. The most frequent use of the word, however, is in relation to those who at any period in English history since the Reformation have refused to conform to the doctrines and practices of the Church of England; though even here, in ordinary usage, it designates only Protestant dissenters. The unification of the English Nonconformists, in spite of their varying beliefs, as one body over against the Established Church practically dates from the repressive measures enacted soon after the Restoration in the first flush of reactionary zeal. The Act of Uniformity, requiring assent from all clergymen to everything contained in the Prayer-Book, drove out nearly 2000 of them, or about one-fifth of the whole number of clergy; these were the first to be formally known as Nonconformists. In the place of Puritanism, now extinct, came political nonconformity, which has since had its seat principally in the middle or lower-middle classes of England, and whose incessant efforts have by this time succeeded in depriving the Church of England of most of its exclusive privileges. The Act of Uniformity was followed by the Corporation Act, which attacked the dissenters in one of their strongholds; the Conventicle Act, which prevented their gathering in any number; and the Five Mile Act, whose result was in many places to deprive them of religious teaching of their own sort.

The next epoch-making date is that of the Toleration Act of 1689, which, while it only relaxed and did not repeal the penal statutes, was at the time regarded as a great charter of religious liberty. Nonconformists acquired legal security for their chapels and funds, with something approaching a clerical status for their ministers. But its policy of grudging and partial indulgence perpetuated the division of the nation into two more or less hostile bodies of Churchmen and Dissenters. Niggardly as it was, it recognized dissent, and shook the belief that the State was bound to provide all its members with a religion and to force it, if necessary, upon their acceptance.

The history of the nineteenth century, or at least the last two-thirds of it, is that of a pertinacious struggle for further recognition on the part of the Nonconformists, crowned with considerable success—though the great object of political nonconformity, the disestablishment of the Church of England, seems further off than it was. In 1836 Dissenters were allowed to be married by their own ministers and rites; the commutation of tithes (q.v.) into a rent-charge rendered their collection less odious; registration of births, deaths, and marriages was transferred from the Church to the State; and a charter was given to the free University of London, which imposed no religious tests. Perhaps the most important of the later gains of nonconformity have been in the department of education—the great universities having been thrown

open to its young men in 1871, and a system of State schools rendering them independent of the Church for primary education. The Burials Act of 1880, allowing their ministers access to the churchyards for funerals, was another concession that had been loudly demanded by them. Generally of an aggressive liberal type in politics, and still smarting under a sense of social inferiority, they form a compact body of no small political power. See **ESTABLISHMENTS**, **ECCLÉSIASTICAL**; **LIBERTY**, **RELIGIOUS**.

NON-EFFECTIVE. This term in its military sense applies to all officers or men not available for effective service. Retired or half-pay officers, pensioners, deserters, sick or wounded, and those held prisoner by an enemy are reported as non-effectives.

NONES. See **KALENDS**.

NON-EUCLIDEAN GEOMETRY. See **GEOMETRY**.

NONFEASANCE (from *non-*, not + *feasance*, deed, from Fr. *faisant*, pres. part. of *faire*, from Lat. *facere*, to do, make). The omission to do an act which one is under a legal obligation to do. It is the view of some writers that nonfeasance never amounts to a tort (q.v.); that to avoid committing a tort one need only to forbear to act. But this is clearly erroneous; as, if an owner of a factory fails to comply with a law requiring him to equip it with fire-escapes, in case of fire he is liable in damages to the person burned. His nonfeasance is a tort.

The term is frequently used in connection with the liability of an agent or servant to third persons. The owner of property employs an agent to manage it and keep it in proper repair. The agent omits to make repairs. Clearly he has violated his contract with his principal, who may call him to account therefor; but the weight of judicial authority in this country holds there is no privity between the agent and a third person, and that in such a case there must be misfeasance or malfeasance by the agent to render him liable. On the other hand, it has been held by a number of courts that the agent is liable to the injured person. His liability should be determined by the rules applicable to negligence (q.v.), not by a dictum of two hundred years, although its author was the distinguished Lord Chief Justice Holt (q.v.), that "a servant or deputy cannot be charged for nonfeasance, but for a misfeasance an action will lie against him." Consult: Jaggard, *Hand-Book of the Law of Torts* (Saint Paul, 1895); Huffcut, *The Law of Agency* (Boston, 1901).

NONIUS. See **VERNIER**.

NONIUS MARCELLUS. A Latin grammarian, born at Thubursicum Numidarum, in Africa, at the beginning of the fourth century A.D. His work entitled *De Compensiosa Doctrina* consisted originally of twenty books, of which the sixteenth is now lost, and was intended as a book of reference on points of lexicography, grammar, and antiquities. Though it shows little critical sagacity, the work is valued for its citations from the lost authors, particularly of the archaic period. There are editions by Mercier (Paris, 1583; reprinted 1826), by Quicherat (Paris, 1871), and by L. Müller (Leipzig, 1888). Consult also Nettleship, *Essays in Latin Literature* (London, 1885).

NON-JUROR, THE. A comedy by Colley Cibber, produced in 1717. It was adapted from Moliere's *Tartufe*. *Tartufe*, transformed into an English Catholic priest, tampers with the loyalty of an English gentleman. It gained for Cibber much favor from the Hanoverian party.

NONJURORS (from *non-*, not + *juror*, from Lat. *jurator*, swearer, from *jurare*, to swear, from *ius*, law, right). The name given to those clergy of the Church of England who refused to take the oath of allegiance to William and Mary, believing themselves still bound by their allegiance to James II. They had been avowed champions of the doctrine of passive obedience on the part of subjects toward kings; indeed, Lake, Bishop of Chichester, said on his deathbed that he looked on the doctrine as the distinguishing character of the Church of England, for which he would lay down his life. The House of Commons allowed the clergy six months longer than the laity to take the oath. Sancroft, Archbishop of Canterbury, with seven bishops and about 400 other clergy, refused it, and were deprived of their sees and benefices. The most distinguished of the Nonjurors was the saintly Bishop Ken; the scholars Hickes and Dodwell were also Nonjurors. They treated all who took the oath as schismatics, and themselves and their adherents as the only true members of the Church of England, and even went so far as to draw up a new liturgy of their own. Their organization, unsubstantial as it was, lingered for over a century, its last bishop dying in 1805. Two of the early missionaries in America, Welton and Talbot, were said to have received episcopal consecration from them, and there is evidence that the latter occasionally exercised episcopal functions in the United States half a century before Bishop Seabury's consecration. Consult Lathbury, *History of the Nonjurors* (London, 1845), a careful work, as far as it goes, supplemented rather than superseded by the most recent authority, Overton, *The Nonjurors* (ib., 1902).

NONNUS (Lat., from Gk. *Nónnos*, *Nonnos*). A Greek poet of Panopolis, in Egypt, probably of the fifth century A.D. While a pagan he wrote a vast epic, preserved under the name of *Dionysiaca* (*Διονυσιακά*) in forty-eight books. Though somewhat bombastic in style, the work is not without poetic spirit, and is one of the chief sources of information on the growth and development of the Dionysiac cycle of myths. After adopting Christianity, he made a paraphrase of the Gospel of Saint John in Greek hexameters. The best editions of the *Dionysiaca* are those of Graefe (Leipzig, 1819-26) and Köchly (ib., 1858). The paraphrase has been edited by Passow (Leipzig, 1834). Consult: Köhler, *Ueber die Dionysiaka des Nonnus* (Halle, 1853); and Ludwig, *Beiträge zur Kritik des Nonnus* (Königsberg, 1873).

NONPAREIL. See **PRINTING**.

NONSUIT. The termination of an action by entry of judgment against the plaintiff upon his failure to appear or prosecute the action, or because of his inability to sustain his case at the trial, in consequence of which the action is ended without a determination of the merits. Under the early system of common-law practice a nonsuit was entered only on motion of the defendant when the plaintiff was in default in prosecuting his action, and if the latter wished

to end the suit, he was obliged to resort to the procedure known as *nolle prosequi* or *retrahit*. However, in modern common-law procedure, a plaintiff is sometimes allowed to end his action by nonsuit, in the discretion of the court, and usually upon payment of costs. Under the various codes of procedure at the present time, the same result is effected by a discontinuance. Where the plaintiff fails to introduce sufficient evidence to make out a *prima facie* case, in many jurisdictions a nonsuit may be ordered by the court before the defendant has introduced any testimony whatever. But where the plaintiff does make out a *prima facie* case, even though the defendant's evidence appears to the court to disprove conclusively the truth of the testimony introduced by the plaintiff, the court cannot allow a nonsuit, against the objection of the plaintiff, as the latter is entitled to have the facts of his case determined by a jury.

A nonsuit differs from a "dismissal" of the complaint or declaration, only in that the latter is a broader term and may involve a determination of the merits of the action. A direction of verdict is also distinguishable from a nonsuit because it involves the merits of the controversy. It is, therefore, important whether an action is terminated by dismissal on the merits, verdict, or direction of verdict, in which cases the party against whom the court decides must appeal if he thinks the judgment erroneous; or whether a nonsuit is entered, as in the latter case the plaintiff can immediately commence a new action on the same state of facts. See ACTION; JUDGMENT; APPEAL; NOLLE PROSEQUI; VERDICT. Consult the authorities referred to under PRACTICE.

NOOTKA, *noot'ka*. A name sometimes applied to a group of closely related tribes of Wakashan stock (q.v.), occupying the west coast of Vancouver Island, southern British Columbia, and including also the Makaw (q.v.), who have conquered for themselves a territory upon the opposite coast of Washington. From their frequent repetition of the word *wakash*, 'good,' Vancouver in 1792 called them Wakash Indians, whence their stock-name *Wakashan* is derived. They are also frequently known as *Aht*, from the termination of the tribal names. The official Canadian report distinguishes eighteen tribes, but Boas counts twenty-two, including the Makaw. Those under Canadian jurisdiction have decreased from 3160 in 1888 to about 2600 at present, of whom 1600 are professedly Christians of various denominations, the others retaining their ancient forms. For general characteristics and customs, see WAKASHAN STOCK.

NOOTKA SOUND. An inlet on the west coast of Vancouver Island, British North America, in latitude 49° 35' N., longitude 126° 34' W. (Map: British Columbia, D 5). Its entrance is protected by an island of the same name, and the Sound can be entered on both sides of the island. It extends inland for ten miles in a north-northeast direction, and affords good anchorage. According to some writers, the Sound was discovered by the Spaniard Don Juan Perez, in 1774; according to others, by the English navigator Capt. James Cook, in 1778. In 1788 Capt. John Meares established an English settlement on the coast, which, however, in the following year was broken up by the Spaniards, who at the same time captured

several British vessels in the Sound. War for a time seemed imminent, but Spain finally agreed in 1790 to restore the property of British citizens and make due restitution.

NORBERT, SAINT. See PREMONSTRATIENSIS.

NORD, *nör*. The most northerly department of France. It is conterminous with the former Province of Flandre (French *Flanders), and stretches along the Belgian frontier, with a shore line on the North Sea (Map: France, J 1). Area, 2228 square miles. It is well watered, exceedingly fertile, and well cultivated, being one of the most densely populated departments of France. The chief agricultural products are wheat, oats, potatoes, and sugar beets. Stock-raising and fisheries are important, and the department is very rich in coal deposits. The Nord is also one of the foremost industrial departments, producing machinery, textiles, porcelain, glass, chemicals, and sugar. The chief of its many large cities are Lille, the capital, Dunkirk, Roubaix, and Valenciennes. Population, in 1891, 1,736,341; in 1901, 1,866,994.

NORDAU, *nör'dou*, MAX SIMON (1849—). A German author, pathological critic of literature and of morals, and a prominent leader in the Zionist movement in Europe. He was born in Budapest of an educated Jewish family; studied medicine in the university of that city, getting his degree in 1872, and after six years of travel throughout Europe practiced in his native town for two years. His earlier writings, chiefly for newspapers and showing something of his later censorious manner, were reprinted under the titles, *Aus dem wahren Milliardenland* (1878); *Vom Kreml zur Alhambra* (1880); and *Paris unter der dritten Republik* (1881). Two years (1880-82) were spent in further medical study in Paris, where Nordau established himself in practice. In France and Germany his literary reputation began with *Konventionelle Lügen der Kulturmenschheit* (1884; French trans. 1886; Eng., 2d ed. 1895), a bold attack on the ethics of modern civilization in general, with particular treatment of the 'religious lie,' or false reverence for the Bible; of the 'governmental lie,' or the falsity of monarchy and aristocracy; of the 'economic lie,' or the untruth of our social system; of the 'social lie,' urging the falsity of conventional marriage laws, and not, as some of his critics have urged, a frenzied treatise against the white lies of society. In the same spirit was *Paradoxe* (1885; 7th ed. 1901; French trans. 1896; and in English, 1895), ironic rather than pessimistic in tone. Nordau's fame in England and America rests almost entirely (unfortunately) on the third of his satiric works, *Degeneration* (1893), from the German *Entartung*, a vigorous polemic against vice or abnormality, and a eulogium of decency in literature and art, at times approaching prudery. The work was dedicated to Cesare Lombroso, and, like the studies of that alienist, has for its theme the relation between genius and degeneracy. Nordau approaches the question from the artistic and moral side; examines the work of art produced, and if it be immoral and foul argues that the artist is, ergo, degenerate, and no genius. The manner of treatment is large and loose, and the chief value of the work is ethical. Nordau's other writings in-

clude the novels, *Die Krankheit des Jahrhunderts* (1889), *Gefühlskomödie* (1891), and *Drohnenschlacht* (1897); the plays, *Neue Journalisten* (1880, with Ferdinand Gross), *Krieg der Millionen* (1882), *Das Recht zu lieben* (1893); *Die Kugel* (1894), and *Dr. Kohn* (1898); and a volume of essays, *Zeitgenössische Franzosen* (1901).

NORDEN, nôr'den, EDUARD (1868—). A German classical philologist, born at Emden; professor in the University of Breslau. His most important publication is a brilliant and comprehensive history of ancient prose style from the sixth century B.C. to the time of the Renaissance, entitled *Die antike Kunstprosa* (2 vols., Leipzig, 1898).

NORDENBERG, nôr'den-bâr'y', BENGT (1822-1902). A Swedish genre painter, born at Kompinkulla, Province of Blekinge. For seven years employed as a house painter, he went in 1841 to Stockholm, and while still following his trade, frequented the Academy until 1851, when he proceeded to Düsseldorf. There he studied under Theodor Hildebrandt and in Paris (1857-58) under Couture. Then he visited Italy and finally settled at Düsseldorf. Much influenced by Tidemand, he chose his subjects almost exclusively from Swedish peasant life, which he depicted with a keen sense of observation and deep feeling. Prominent among such popular scenes are: "Communion in a Village Church" (1856, National Gallery, Christiania); "The Organist" (1861, Leipzig Museum); "Levying the Tithe in Schonen" (1862) and "Wedding Procession in Vårend" (1873), both in the Stockholm Museum.

NORDENFELT MACHINE GUN. See MACHINE GUNS.

NORDENSKJÖLD, nôr'den-shêld, NILS ADOLF ERIC, Baron (1832-1901). A famous geographer and explorer. He was born at Helsingfors, Finland. He entered the university of his native town in 1849, where he devoted himself especially to chemistry and mineralogy. In 1853 he accompanied his father to the Urals and studied particularly the iron and copper mines at Tagilsk. Returning home, he published his first papers, dealing with the minerals and mollusca of Finland, and received an appointment as curator of the mathematico-physical faculty. He was suddenly dismissed, however, because he offered a toast at a banquet to which the Governor gave an obnoxious political significance. Visiting Berlin, he engaged in researches in mineral analysis at Rose's laboratory, and in 1857 returned to Finland, obtained the Alexander traveling stipend from his university, together with his degree as master and doctor, and prepared for a geological expedition to Siberia and Kamchatka. Another unlucky toast gave offense to the Russian Governor-General, and he drove the offender from the country, following him up with a dispatch depriving him of the right of ever holding office in the university. This disqualification lasted until a new Governor-General was appointed in 1862. Nordenskjöld settled in Stockholm in the winter of 1857-58, and Sweden became his adopted country. During 1858 he made his first voyage to Arctic seas as companion to the Swedish geologist Torell, and made valuable discoveries of the remains of Tertiary plants. After his return he was appointed professor and

director of the Royal-Museum, Stockholm. In 1861 he made a second expedition to Spitzbergen with Torell, and surveyed the northern part of the archipelago. Upon invitation of the Royal Academy of Sciences of Sweden, Nordenskjöld led an expedition to Spitzbergen in 1864, completing a preliminary survey for the arc of the meridian, mapping the southern part of Spitzbergen, and collecting new data as to fauna and flora. His next expedition was in 1868, when in the *Sofia* he penetrated to latitude 81° 42' N. A visit to Greenland had important scientific results in that he was enabled to formulate a theory as to the nature of the ice-sheet that once covered the greater part of Europe by his examinations of similar formations upon the Greenland ice-cap. The expedition of 1873 accomplished the discovery of what he supposed to be cosmic dust on polar ice and the survey of part of Northwest Land. Crossing the Kara Sea in 1875, he penetrated to the Yenisei and returned home overland, believing that a northeast passage could be made from Europe to the eastern shore of Asia. The opinion was put to the test in 1878-79. He left Tromsø on July 21, 1878, in the *Vega*, and continued his journey eastward till the end of September, when he became ice-bound in latitude 67° 7' N. and longitude 173° 23' W., not far from Bering Strait. Here he remained imprisoned until July 18, 1879, when the expedition was released. He then passed through Bering Strait and sailed to Japan. For this achievement the King of Sweden and Norway conferred upon Nordenskjöld the rank of a baron in the Swedish peerage, and he was appointed commander of the Order of the North Star. In 1883 he made his last expedition to Greenland. Nordenskjöld was a liberal in politics and sat in 1870-72 in the Lower House of the Swedish Diet. He discovered uranium in many varieties of coal, and showed that fresh water could be found anywhere in Sweden at a depth of 100 feet through the Archæan rocks. Besides scientific reports and monographs, his principal works are: *The Voyage of the Vega Around Asia* (1881); *The Second Swedish Expedition to Greenland* (1885); *Facsimile Atlas to the Early History of Cartography* (1889); and *Periplus* (1897). Consult the autobiographical sketch in Bejér's *Swedish Biographical Lexicon*, a translation of parts of which may be found in *The Arctic Voyages of Adolf Erik Nordenskjöld*, edited by Alexander Leslie (London, 1879); also articles and bibliography in *Ymer*, vol. xxii. (Stockholm, 1902).

NORDERNEY, nôr'der-nî. The most important of the East Frisian Islands, lying off the northwest coast of Germany, and belonging to the Prussian Province of Hanover (Map: Prussia, B 2). It is eight miles long, about a mile wide, and covered with dunes 50 to 75 feet high. The island is the most popular German sea-bathing resort, visited annually by over 14,000 persons. The village at the western end is protected by a large sea-wall. It has a handsome Konversationshaus with a museum, and a national hospital for children. A large lighthouse stands in the centre of the island. The permanent population is about 4000.

NORDHAUSEN, nôr't-hou'zen. A city in the Province of Saxony, Prussia, on the Zorge, 38 miles north-northwest of Erfurt (Map: Prussia, D 3). The Church of Saint Blasius with paintings by Lucas Cranach, the Roman Catholic late-

Gothic Cathedral, and the museum of antiquities, are worthy of note. The town is the centre of a large general trade, especially in grain and cattle. It has extensive distilleries and breweries, and considerable manufactures of tobacco, chemicals, leather, cloth, sugar, and machinery. Population, in 1890, 26,847; in 1900, 28,500. Nordhausen is mentioned in the tenth century, and was made a free Imperial city in 1253.

NORDHOFF, nörd'hóf, CHARLES (1830-1901). An American journalist, descriptive and miscellaneous writer, born in Erwitte, Westphalia. He came to America in 1835, was educated in Cincinnati, and was for nine years at sea, in the navy and merchant service; from 1853 to 1857 in various newspaper offices; was then employed editorially by the Harpers (1861), and for the next ten years on the staff of the *New York Evening Post*. From 1871 to 1873 Nordhoff traveled in California and visited Hawaii. He then became Washington correspondent of the *New York Herald*. The more noteworthy of his books are: *Man-of-War Life*, largely autobiographical (1855); *The Merchant Vessel* (1855); *Whaling and Fishing* (1856), both the result of personal experience, as was also *Nine Years a Sailor* (1857); then for ten years politics and sociology were his themes in *Secession Is Rebellion* (1860); *The Freedmen of South Carolina* (1863); *America for the Working Men* (1865). To sociology he contributed: *Politics for Young Americans* (1875), perhaps the best known and most useful of his books; *The Communist Societies of the United States* (1875). Later volumes are *God and the Future Life* (1881) and *Peninsular California* (1888). Nordhoff died in California in July, 1901.

NORDICA, LILLIAN, born NORTON, (1859—). An American soprano, born at Farmington, Me. She was pupil of the New England Conservatory and of J. O'Neill, making her début in 1876. Then followed two years of successful concert work, on the conclusion of which she accompanied Gilmore's band to Europe, and later took up the study of opera with San Giovanni. She was an earnest student, and possessed of considerable stage aptitude, which, together with her magnificent voice and pleasing presence, won her an immediate success. After touring Germany and Russia, she appeared in 1881 in Paris, where her success was absolute. Her marriage with Frederick A. Gower in 1882 turned out to be unfortunate, and three years later she sued for a separation, the proceedings in which were brought to a close by the disappearance of Gower, supposedly in a balloon accident. In 1887 she appeared in London, and in 1895 made her first appearance in opera in her native land, at the Metropolitan Opera House, New York. Two years later she married Döme, an Hungarian singer. She achieved her greatest successes in *Aida*, *Les Huguenots*, and the soprano parts in the Wagnerian operas, and came to be regarded as one of the greatest prima donnas of her day, being especially noted for her coloratura work.

NÜRDLINGEN, nörd'ling-en. A town in the western part of Bavaria, Germany, on the Eger, 39 miles northwest of Augsburg (Map: Germany, D 4). It is an ancient town with walls and towers. The Gothic Saint George's Church, and the late-Gothic Rathaus, with a collection of old German pictures and fine mural paintings, are

worthy of mention. The town has a Realschule and a fine library. Among the manufactures of Nördlingen are furniture, linen, woolen, and leather goods, carpets, and agricultural implements. Population, in 1890, 8004; in 1900, 8299. Nördlingen is mentioned for the first time about 900, and became an Imperial city under the Emperor Frederick II. The town is best known for the two battles of which it was the scene during the Thirty Years' War. In the first, fought on August 27 (new style, September 16), 1634, the Protestant army of Bernhard of Weimar and the Swedes under General Horn were overwhelmed by a superior force of Imperial troops under Ferdinand, the King of the Romans. This was the first defeat of the Swedes on German soil, and its effect was the delivery of South Germany from the foreigner. The second battle, fought on August 3 (13), 1645, between the French and the Imperial troops, resulted in the defeat of the latter and the death of their commander, General Mercy.

NORDMANN, nört'mán, JOHANNES (1820-87). An Austrian author, whose family name was Rumpelmaier. He was born at Landersdorf, and studied at Vienna, whither he returned in 1848, after several years in Dresden and Leipzig, and where as a member of the Academic Legion he played a prominent part in the Revolution. From 1859 to 1869 he edited the *Wanderer*, and subsequently wrote for the *Neue Freie Presse* and other papers. *Gedichte* (1847), a volume of lyrics, contains the best of his poetical works. A posthumous volume of poems appeared in 1889. He also wrote the epic *Eine Römerfahrt* (1875-77); various novels and tales, *Zwei Frauen* (1850), *Frühlingsmächte in Salamanca* (1857; 3d ed. 1880), *Ein Wiener Bürger* (1860; 2d ed. 1882), and *Der zerbrochene Spiegel* (1870); and books of travel.

NOREEN, nō-rän', ADOLF GOTTHARD (1854—). A Swedish philologist. He was born at Oestra Emtervik, Sweden. After graduating from the University of Upsala in 1877, he became a privat-docent there and in 1887 professor of the Scandinavian languages. Among his principal publications are: *Aeldre Västgötalagen* (1876); *Altisländische und altnorwegische Grammatik* (2d ed. 1892); *Abriss der urgermanischen Lautlehre* (Strassburg, 1894); *Altswedische Grammatik mit Einschluss des Altgutnischen* (1898). Noreen contributed the article on the Scandinavian language to Paul's *Grundriss der Germanischen Philologie*, and is the author of a number of articles published in the *Arkiv för Nordisk Filologi*, of which he is one of the editors. He holds a very high place among European philologists.

NORFOLK, nōrfak. A maritime county of England, bounded north and northeast by the North Sea, and south by the county of Suffolk (Map: England, G 4). Area, 2037 square miles, mostly level ground. The soil, consisting chiefly of light sands and loams, is not naturally of a productive character, but has been made so by systematic treatment, and Norfolk is chiefly an agricultural, stock and poultry raising county. The principal rivers are the Ouse, Yare, and Bure. Capital, Norwich. Population, in 1891, 454,500; in 1901, 460,000. Consult: Mason, *History of Norfolk* (London, 1882-85); Rye, *History of the County of Norfolk* (London, 1885).

NORFOLK. The second largest city of Virginia, and a port of entry, in Norfolk County, 88 miles in a direct line, and 116 by water, southeast of Richmond; on the Elizabeth River, an arm of Chesapeake Bay, opposite Portsmouth and Berkley, the three cities practically forming one municipality, having a population, within a radius of three miles, of more than 115,000 (Map: Virginia, H 5). Norfolk is the terminus of many steamship lines, including transatlantic, coastwise, and interior lines, the Albemarle and Chesapeake and the Dismal Swamp canals affording additional means of communication with inland towns. The railroad facilities comprise the Atlantic Coast Line, the Seaboard Air Line, the Chesapeake and Ohio, the Norfolk and Western, the Norfolk and Southern, the New York, Philadelphia and Norfolk, and the Southern. Norfolk has an area of about 3¼ square miles, and is irregularly laid out on level ground. The more prominent buildings include the custom-house, the city hall, Saint Vincent's Hospital, the Norfolk Protestant Hospital, the post-office, and the Citizens' Bank. Saint Paul's Church is of historic interest, having been built in 1737. The city maintains a public library (10,500 volumes), and has several private secondary schools, among which is the Norfolk Mission College (United Presbyterian), an institution for colored students. There is a public park of 95 acres. The Norfolk Navy Yard is at Portsmouth (q.v.).

Norfolk is one of the most important Southern ports, its excellent transportation facilities contributing largely to its commercial prominence. The harbor is commodious, accessible for the largest ships, has a channel 30 feet deep, and is well protected, the defenses including Fort Monroe (q.v.). Norfolk and Portsmouth together constitute a Federal customs district, the foreign trade of which in 1901 comprised exports valued at \$10,308,000 and imports aggregating \$594,000. The commerce of the port is principally in lumber, coal, grain, cotton, peanuts, oysters, vegetables, and fruit. One of the largest coaling stations in the world is here—Lambert's Point coal piers, which handle annually some 2,500,000 tons. Norfolk is developing rapidly also as an industrial centre, a number of large plants having been established since 1900, when its manufactures, according to the census, represented capital to the amount of \$6,425,000, and had a production valued at \$9,397,000, a notable gain in output over that of 1890 (\$5,100,000). The most important industrial establishments are fertilizer works, lumber mills, hosiery and knitting mills, cotton and silk mills, oil mills, carriage and wagon shops, foundries and machine shops, a steel shutter and blind manufactory, ship and boat building yards, creosoting works, agricultural implement works, tobacco and cigar factories, a large pickling establishment, etc. Under the charter of 1884, as subsequently amended, the government is vested in a mayor, elected every two years, and a council consisting of two bodies, the members of the select council being chosen by all the councilmen from among their own number. The council controls appointments of all administrative officers, excepting those elected by popular vote—school trustees, treasurer, attorney, street inspector, commissioner of revenue, collector of taxes, health officer, and minor officials. Norfolk spends

annually in maintenance and operation about \$845,000, the principal items being: for interest on debt, \$250,000; for streets, \$80,000; for water, \$65,000; for the police department, \$60,000; for schools, \$60,000; for the fire department, \$45,000. There are municipal water-works, built in 1872, and acquired by the city in the following year; the system cost \$1,235,000 and has about 59 miles of mains. Population, in 1840, 14,620; in 1880, 21,966; in 1890, 34,871; in 1900, 46,624.

Organized as a town in 1682, Norfolk was incorporated as a borough in 1736, and was chartered as a city in 1845. On January 1, 1776, it was bombarded and set on fire by the English under Lord Dunmore, and nine-tenths of the buildings were destroyed. In 1855 the city suffered severely from the ravages of yellow fever. In April, 1861, General Taliaferro, at the head of a body of Virginia troops, entered the city, and soon afterwards the navy yard was fired by order of the Federal commandant, but comparatively little damage was done. Until May, 1862, when the Federal forces took possession, the city was the chief naval station of the Confederacy. Consult: Forrest, *Historical and Descriptive Sketches of Norfolk and Vicinity* (Philadelphia, 1853); Burton, *The History of Norfolk, Virginia* (Norfolk, 1877); Lamb, *Our Twin Cities of the Nineteenth Century* (ib., 1887-88).

NORFOLK, DUKES OF. See HOWARD.

NORFOLK ISLAND. An isolated island in the Pacific Ocean, 500 miles northwest of New Zealand, and 1200 miles northeast of Sydney; latitude 29° 3' S., longitude 167° 58' E. (Map: Australasia, J 5). Its area is 10 square miles. The coasts are high and steep, and the interior is mountainous, rising in Mount Pitt to a height of 1040 feet. In its forests the most conspicuous tree is the magnificent Norfolk Island pine (*Araucaria excelsa*). The soil is fertile and the climate is healthful. The inhabitants in 1901 numbered 870, most of whom are the descendants of the mutineers of the *Bounty*, who in 1856 were transferred hither by the British Government from Pitcairn Island (q.v.). Others are pupils in the Melanesian mission school established here. The island is governed by a resident magistrate and council under the administration of New South Wales. It was discovered by Cook in 1774, and was used by New South Wales as a penal settlement down to 1851.

NORFOLK ISLAND PINE. See ARAUCARIA.

NORFOLK SPANIEL. See SPANIEL.

NORICUM. A province of the Roman Empire, corresponding to Styria, Carinthia, parts of Upper and Lower Austria and Bavaria, and Salzburg. It was bounded on the north by the Danube, on the east and south by Pannonia; also south by Illyricum and Cisalpine Gaul; on the west by Rhætia. The region is mountainous, the Noric Alps stretching through the centre of the province; the chief rivers were the Enus (modern Inn), Dravus (Drave), and Murius (Mur). The chief town was Noreia, mentioned by Caesar in his *Commentaries*. The province was subdued by the generals of Augustus (c.13 B.C.). The Romans obtained iron and salt from the region, and, it is said, gold.

NORMA. An opera by Bellini (q.v.). produced at La Scala, Milan (1832). The libretto

by Romain was based on Saumet's tragedy *Norma*, which appeared in 1831. Norma, a high priestess of the Druids, secretly married Pollio, the Roman general. He, faithless to her, urges the virgin Adelgiza to fly with him. She confesses to Norma, who in fury calls the Druids, and Pollio is condemned. Norma, confessing her broken vows, dies with him.

NORMAL. A town in McLean County, Ill., 61 miles northeast of Springfield; on the Illinois Central and the Chicago and Alton railroads (Map: Illinois, C 3). It is the seat of the Illinois State Normal University, and of the State Soldiers' Orphans' Home. Nursery stock, fruit, and vegetables are extensively cultivated in this vicinity; and Normal is also an important horse market. There are municipal water-works. Population, in 1890, 3459; in 1900, 3795.

NORMAL (Lat. *normalis*, according to rule, from *norma*, rule, carpenter's square). In mathematics, a straight line perpendicular to a tangent at the point of its contact with the given curved line or surface. The evolute (q.v.) of a curve may be considered as the envelope of the normals to the given curve. This relation is evident since the centres of curvature of which the evolute is the locus are the intersections of normals at adjacent points of the curve; e.g. the semicubical parabola, an evolute of the common parabola, is an envelope of the normals to this curve. See PARABOLA.

The *subnormal* corresponding to any curve is the segment of the axis intercepted by the normal and the ordinate of the point of contact.

NORMAL COLLEGE. An institution for the training of teachers, in New York City, founded in 1869 and having its inception in the growing demand for professionally trained teachers in the public schools of New York. Previous to its foundation the secondary education of women in New York was supplied by private schools and the supplementary classes of the public grammar schools. The inadequacy of this method was, however, soon felt, and as early as 1847 the State Legislature contemplated an institution similar to the City College. (See NEW YORK, COLLEGE OF THE CITY OF.) In 1856 a Daily Normal School was actually established, but it ceased to exist after a precarious career of about three years. The Saturday Normal School was then organized for the training of teachers. While these makeshifts were being resorted to in New York, the State at large was rapidly increasing its number of normal schools, and otherwise multiplying the facilities for the training of teachers. This educational awakening throughout the State had the effect of hastening the establishment of a normal institution in New York City. In 1869 the Board of Education was empowered to establish a female institution similar to the City College, and the same year the Normal and High School was established. The name was changed in the following year to Normal College. The pupils of the various supplementary classes were admitted to advanced standing and a three years' course was organized. The task of arranging the work of the new institution fell to Dr. Thomas Hunter, the president since its inception. Under his vigorous administration the college grew rapidly. A building erected on the block bounded by Lexington and Park Avenues and Sixty-eighth and Sixty-ninth streets, at a cost of over \$350,-

000, was opened in 1873. A model primary school was opened for practice teaching at an additional cost of \$80,000, and the first free public kindergarten in the United States was established at the Normal College in 1871. The Board of Education and the president of the college have since its organization constituted an ex officio board of trustees. The attendance, which in 1870 numbered 969, with a graduating class of 97, increased by 1902 to 2844. In the same year the staff of instructors, including those in the training department, numbered 101. The total number of graduates since the foundation of the college was, in 1902, over 9000. There has been a constant tendency to raise the requirements for graduation; the course was extended to four years in 1879, to five, for students taking a degree, in 1888, and in 1902 a professional course of six and a collegiate course of seven years were organized, the institution thus being raised to the standard required by the University of the State of New York for degree-conferring institutions. The college includes five fully equipped laboratories and the Alumnæ library. High school graduates are admitted to advanced standing.

NORMAL SCHOOL. In general, any institution for the professional training of teachers. In a special sense, the term is used to designate a school for the training of elementary school teachers, carried on usually by the State, sometimes by private enterprise, which receives students who have had more or less high school training, and gives them academic and professional courses. Normal schools in some form are now found throughout the civilized world, usually as integral parts of the systems of public education in the several countries or States. The earliest successful normal school appears to have been that established by La Salle in 1685 at Rheims, France. Not until early in the nineteenth century, however, were public normal schools established in France. In Germany the first attempt to provide professional training for teachers is attributed to August Hermann Francke, who in 1704 founded the normal school at Halle, which still bears his name. During the reign of Frederick the Great, and especially during the period after the French Revolution, many normal schools (or teachers' seminaries, as they are called) were founded, especially in Prussia. There are to-day in Prussia alone no fewer than 116 normal schools. In Great Britain there is a well-developed system of public normal schools (called also teachers' training colleges), the growth chiefly of the last fifty years. The British system has been successfully extended to Canada, Australia, and South Africa. In America the first normal schools were founded in Massachusetts in 1839 and 1840 at Lexington, Barre, and Bridgewater. They were the result, in particular, of the combined efforts of the following men toward securing higher qualifications among teachers: Charles Brooks, who visited Prussian normal schools in 1834, and disseminated the ideas he had gained during the following two years; of Henry Barnard, the distinguished pioneer in educational journalism and educational progress; of Edmund Dwight, who offered the Legislature \$10,000 on condition that it should appropriate an equal amount to promote the preparation of teachers for the com-

mon schools; and especially of Horace Mann, who as secretary of the State Board of Education did more than any other man to develop the normal school idea and to make it effective. The course in these early normal schools included (1) the science and art of teaching the common school branches; together with (2) the subject matter of these branches, and, if possible, of such higher studies also as algebra, geometry, general history, natural philosophy, and astronomy; and (3) practice teaching in a model school. In the thirty years following the establishment of these schools, no fewer than fifteen leading normal schools of the highest type were established in as many different States; and many more of inferior quality. In 1898-99 there were in the United States 166 public and 165 private normal schools, with a total enrollment of 68,380 students.

In standards and courses of study the normal schools of the United States vary widely. The minimum entrance requirements are indicated by the subjects in which examinations are required for admission, viz. arithmetic, geography, grammar, composition, orthography, American history, civil government, physiology and hygiene, and penmanship. Students presenting these qualifications may be graduated on completion of a two-year course, including one year devoted to the theory and practice of teaching. The more advanced courses include high school subjects, methods in elementary subjects, psychology, the science of education, history of education, child study, and practice teaching. Many normal schools offer special courses for the training of kindergarten teachers.

The name Normal College has been given to certain institutions, like the Albany State Normal College, and the Michigan State Normal College, which require a full high-school course for admission, and which, in addition to more extended professional courses than are usually offered by normal schools, undertake the preparation of teachers for secondary schools. Such institutions are empowered to grant pedagogical degrees.

The establishment of university chairs and departments of education, a movement of the greatest significance for education, has been the growth of the past fifty years. Its beginnings were weak and tentative. In America the honor of the earliest attempts is due to President Francis Wayland at Brown University (in 1850), to Horace Mann, at Antioch College (in 1853), and to President Barnard, at Columbia College (in 1858). The first chair of education to be established on a solid basis in an American college or university was that at the University of Michigan under President Angell in 1879, since which time such departments have been established in large numbers throughout the country.

The rapid growth of large cities has created a demand for trained teachers, which all the agencies thus far mentioned have proved entirely inadequate to supply. This need has been met in part by the establishment of city training schools. The Brooklyn Training School, organized by Superintendent William H. Maxwell, is a type of the best of such schools. It receives on examination the graduates of public high schools, and prepares them to be teachers in elementary schools by a course in the history of education, pedagogy, methods of teaching ele-

mentary subjects, etc. A half year is also spent in substituting for pay in the public schools.

For the benefit of teachers in the service, particularly those who have had little or no professional training, teachers' institutes have been organized, and have been a feature of American education for the past sixty years. The teachers' institute is a short-time school, whose aim is to give stimulus and guidance to teachers in personal knowledge and skill, and in personal culture. Its curriculum usually includes methods of teaching and school management, the subject matter of some branch or branches of literature, science, or art, together with general lectures for culture or recreation. The method of instruction is usually by lectures; but sometimes lessons are assigned and recitations held—the best institutes having modified the formal lecture system. The instruction is given either by a regular institute corps, as in the State of New York, or by a special corps organized for each institute, as in Pennsylvania. See NATIONAL EDUCATION, SYSTEMS OF; NORMAL COLLEGE; PEABODY NORMAL COLLEGE; SUMMER SCHOOL; TEACHERS COLLEGE.

NORMAN. A city and the county-seat of Cleveland County, Okla., 50 miles south of Guthrie; on the Atchison, Topeka and Santa Fe Railroad (Map: Oklahoma, F 3). It is the seat of the University of Oklahoma, which was opened in 1892, and of the Territorial Insane Asylum. There are manufactures of cottonseed oil, flour, etc., and some trade with the fertile agricultural section adjacent. The water-works are owned by the municipality. Population, in 1890, 787; in 1900, 2225.

NORMAN, HENRY (1858—). An English traveler and author, born in Leicester, September 19, 1858. He graduated from Harvard and studied at Leipzig University. For some years he was on the *Pall Mall Gazette*, and later he became assistant editor of the *Daily Chronicle*, from which he withdrew in 1899. His voyages include the United States and Canada, Japan, China, Siberia, Korea, India, Siam, the Malay Peninsula, and Egypt. We may mention these works: *An Account of the Harvard Greek Play* (1881); *The Real Japan* (1892); *The Peoples and Politics of the Far East* (1895); *The Near East* (1899); *All the Russias* (1902); and *Delhi: An Account of the Great Mutiny in India* (1902). The work of this writer is characterized by keen insight, fairness, and brilliant sobriety of tone.

NORMAN ARCHITECTURE. A style originated and chiefly used by the Normans, and a subdivision of Romanesque (q.v.) architecture, under which its principal monuments are described. Soon after their conquest of the

north of France, during which they had indulged in wholesale burning of churches and monasteries, the Normans began to rebuild religious structures on a larger scale, as a consequence of their conversion. They accordingly expanded the dimensions, while to a great extent at first retaining the style of the buildings they found in France. They seem also to have borrowed some of their ideas from the Rhine, and from Lombardy, especially the use of vaulting. They carried the architecture of their province and of France with them to England with the Conquest, and even to South Italy, where they established a great kingdom in the eleventh century. The leading characteristics of their style were great size, simplicity, and massiveness. They adopted the old Basilical plan of central and side aisles and semicircular apse, though the square apse was sometimes used in England toward the close of the style. They seized on the tower as a distinguishing feature, and developed it as their style progressed, placing one usually on each side of the façade. The ornaments are simple and of great variety; but the most common and distinctive are the zigzag, billet, chevron, nail-head, etc. The windows and doors are simple, with semicircular arched heads—the former without tracery. The tympanum of the door-arch is occasionally filled with sculpture. The nave arches are carried sometimes on heavy single pillars in English examples, but more frequently, especially as the style advanced, on piers with shafts. Owing to the great size of the buildings, the architects were unable at first to vault the main aisle, which, accordingly, had usually a wooden roof, the side aisles only being vaulted. In France, however, vaulting of the nave became common after 1100, though not in England.

The masonry was at first rude, the joints being large, and the stones hewn with the axe; but in the twelfth century the technique improved with the use of the chisel. The style prevailed from about the beginning of the eleventh century until the rise of Gothic in the thirteenth. There are many examples in Normandy, the churches at Caen being well-known buildings of the date of William the Conqueror. The chapel in the white tower of the Tower of London is the earliest example of pure Norman work in England. The development of vaulting in the French section of the Norman school furnished the models for the development of the Gothic method of ribbed vaulting, while the English section remained stationary and maintained itself longer than in France, until early in the thirteenth century. The Normans, while good builders, did little in sculpture, painting, or the minor arts.

BIBLIOGRAPHY. The most important publication is Ruprich-Robert, *L'architecture normande* (Paris, 1884-90), which illustrates the principal buildings both in Normandy and in England. An even fuller illustration is given in Dehio and Bezold, *Kirchliche Baukunst des Abendlandes* (Stuttgart, 1892).

NORMANBY, CONSTANTINE HENRY PHIPPS, Marquis of (1797-1863). An English statesman and author. He was the eldest son of the first Earl Mulgrave. He was educated at Harrow and Cambridge, and became member of Parliament for Scarborough in 1818. Although of a Tory family, he acted with the Liberals; his first speech was in favor of the political claims

of the Roman Catholics, and his second advocated Lord John Russell's proposals for Parliamentary reform. He succeeded to the title in 1831, and soon after was made Governor of Jamaica, where he successfully executed the act for the emancipation of the slaves, and suppressed without loss of life a mutiny of the soldiers. Returning to England, he succeeded the Earl of Carlisle as Lord Privy Seal in 1834. He was Lord Lieutenant of Ireland (1835-39), and displayed an impartiality which won the approbation of O'Connell. He was made a marquis at the coronation of Victoria, and was Colonial Secretary for a short time in 1839, but was soon transferred to the home department, where he remained till 1841. From 1846 to 1852 he was Ambassador at Paris, and from 1854 to 1858 at Florence. He published *A Year of Revolution* (1857), containing his personal observations at Paris, and a number of novels, including: *Matilda* (1825), *Yes and No* (1828), and *The Contrast* (1832).

NORMANDY (Fr. *Normandie*). A former province of France, bordering on the English Channel. Its capital was Rouen. It is comprised in the modern departments of Seine-Inférieure, Eure, Orne, Calvados, and La Manche. In the northeastern part of Normandy (formerly Upper Normandy) are the towns of Rouen, Dieppe, Havre, Harfleur, Honfleur, Lisieux, Evreux, Yvetot; in the southern and western parts (Lower Normandy) are Caen, the chief town, Falaise, Saint-Lô, Bayeux, Coutances, Avranches, Granville, Alençon, and Cherbourg.

In the time of the Romans the region was included in *Gallia Lugdunensis Secunda*. Under the Frankish monarchs it formed a part of Neustria, and came to be known as Normandy after Charles the Simple, in 911 (912?), had given it to Hrolf or Rollo, the leader of a band of Norse rovers (see **NORMANS**), as a fief of the French Crown. From Hrolf (baptized under the name of Robert) and Gisela, the daughter of Charles the Simple, sprang the dukes of Normandy, of whom Richard I. (grandson of Hrolf) vigorously maintained his authority against his liege lords, Louis IV. and Lothaire. William II., son of Robert II., *le Diable*, became Duke of Normandy in 1035, and in 1066 established a Norman dynasty on the throne of England (see **WILLIAM I.**), thereby politically uniting Normandy with the latter country. In 1077 his eldest son, Robert, wrested Normandy from him, but it was again united to England under Henry I. in 1106. With this monarch the direct male line became extinct. Henry II., the son of Henry I.'s daughter, Matilda, after the death of Stephen of Blois, obtained in 1154 the government of England and Normandy; but in the reign of his son, John, Normandy was conquered by Philip Augustus of France (1202-04). It remained a portion of the French monarchy for over two centuries, save when conquered by Edward III. in 1346; but after the battle of Agincourt (1415) it was reconquered by the English, who held it till 1449, when it was finally wrested from them by Charles VII. The Channel Islands, which were once a part of Normandy, have remained in possession of England. Consult: Dumoulin, *Histoire générale de Normandie* (Rouen, 1631); Goube, *Histoire du duché de Normandie* (Rouen and Paris, 1815); Barthélemy, *Histoire de la Normandie ancienne et moderne* (Tours, 1857).

NORMAN FRENCH. A French dialect which originated in Normandy after the Scandinavian invaders, under Rollo, had settled there about 911. (See NORMANDY and NORMANS.) At a very early date these Scandinavians adopted the French language, together with French religion and culture. The Normans in adopting French as a medium of communication and for purposes of literary expression retained many Scandinavian words, which are still, though in a greatly changed form, characteristic of this French dialect. It is not always possible, however, to distinguish these elements, because the Norman French has been influenced, though undoubtedly to a much less extent, by another Germanic tongue, the Saxon. The largest class of Scandinavian derivatives in Norman French is that of proper names of persons and places. Among the first of these, occurring in early works, may be mentioned *Boudre*, from *Baldr*; *Héroult*, from *Haraldr*; *Turquetil*, from *Thor-ke-till*; *Sigvard*, from *Sigvarth*. In place names suggestions of a Danish origin are numerous, as in *Danneval*, *La Dennerie*, *Danemarche*, *Dan-court*. Many Northern suffixes occur in Norman place names, as *dalle* in *Brecoquedalle*, *bee* in *Caudebec*, *Houlbec*, etc., *torp*, familiar in English words of Northern origin, in *Torgistorp*, and *stein*, in *Crestein* and *Goustein*. Among other words of possible Scandinavian origin the following may be noted: *bruman*, a newly married man; *vin huet*, white wine; *raguer*, to shave or rake; *tang*, seaweed, Old Icelandic *thang*. Several nautical terms in use in Norman French seem to be of Norse origin, as *brant*, the bow of a ship, Old Norse *brandr*, *escuif*, a ship; *hune*, top of a mast, Old Icelandic *hunn*. A few of these words have passed into standard French, but most of them are used only dialectically. Norman French is also distinguished by its sounds, prominent among which is the pronunciation of initial *h*, which in the other French dialects is silent. During the early period Norman French played an important part in French literature, some of the most important monuments being written in this dialect.

Of greater interest to English readers than the peculiarities of Norman French at home is its development in England after the Conquest. In order to distinguish between the French used on the Continent and that used in England, the latter is often called Anglo-Norman or Anglo-French, of which terms the second is now the more generally used. One of the most obvious of these influences in the case of Anglo-French was the introduction of English words, especially those that expressed specifically English ideas, for which no French word existed. The pronunciation, too, was influenced by the English, especially in connection with the accent. The influence of French had begun before the Conquest, as a result of the strong French sympathies of Edward the Confessor, and for several centuries after the Conquest French continued to be the Court language. A considerable French literature was produced in England, both in poetry and prose, and many works of a non-literary character, such as law codes, wills, etc., have been preserved. Many French words were borrowed, forming the first period of the French element.

The best popular account of the Anglo-French is found in Skeat, *Principles of English Ety-*

mology, second series (Oxford, 1891). The best technical treatment is by D. Behrens, in Paul's *Grundriss der germanischen Philologie* (2d ed. 1897). There is no complete dictionary of Anglo-French, though a number of texts have been edited. Useful lists of English words found in Anglo-French have been published by Skeat (1882-89). The question of the influence of Scandinavian culture on the Normans has been discussed from opposite sides by Le Héricher, *Les Scandinaves en Normandie* (Paris, 1877), and A. Fabricius, *Danske Minder i Normandiet* (Copenhagen, 1897).

NORMAN LAW. When, about 911, Charles the Simple ceded to the Scandinavian pirate Hrolf, or Rollo, that portion of Neustria which was thenceforth known as the Duchy of Normandy, the institutions and customs of the country were Frankish. These institutions and customs the conquerors apparently accepted, for there is little trace in the later Norman law of Scandinavian influences. Some at least of the Frankish imperial institutions were more fully preserved under the Norman dukes than in other parts of France. Our knowledge, however, of Norman law in the tenth and eleventh centuries is very imperfect; it is based largely on inferences from earlier Frankish and later Anglo-Norman sources.

For the period from the Norman conquest of England in 1066 to the French conquest of Normandy in 1202-04 we have considerable material; we have twelfth century documents (printed by Bigelow as an appendix to his *History of Procedure in England*, 1880) and more or less complete Exchequer Rolls of various dates from 1180 to 1203 (published by Stapleton, with valuable observations, 1840, 1844). That the organization of the exchequer was originally Norman and not English is shown by its existence in the Norman Kingdom of Sicily in the first half of the twelfth century. As later in England, exchequer was a judicial as well as an administrative authority, and from the time of Henry I. it included trained lawyers. Like the Frankish emperors, the Norman dukes sent out *missi*, or itinerant justices, who held court in various parts of the duchy. In the ducal court and in the circuit courts procedure was initiated by ducal writ (*breve*), and proof by wager of battle was supplanted by an inquest of the vicinage. This was a further development of the Frankish *inquisitio*; and the Norman 'jury of proof,' as Brunner calls it, was transferred to England and became the jury of judgment. That in other respects the influence of Norman law upon English law was very great is universally admitted; but there is as yet no agreement as to the extent to which it superseded the older Saxon law.

When Philip Augustus conquered Normandy he promised that the duchy should preserve its privileges. Shortly before, about 1200, a private compilation had been made, known as the *Statuta et Consuetudines Normannia*. To this was added, about 1218, a *Tractatus de Brevis et Recognitionibus*. Later in the same century appeared compilations of judgments rendered in the exchequer and of judgments rendered in assize. The most complete statement of Norman law, however, is the *Grand Coutumier de Normandie*, described in the oldest Latin texts as the *Summa de Legibus Normannia* or *Jura et Consuetudines Normannia*. See GRAND COUTUMIER OF NORMANDY.

Gradually, by judicial interpretation, the law of Normandy was assimilated to that of Paris and of Northern France generally. Not only were the courts filled with French judges, but cases were carried to the Parliament in Paris. The notes or glosses which accompany the fifteenth century copies of the *Grand Coutumier* misinterpret some passages and declare that others are no longer in force. About the middle of the sixteenth century Guillaume Terrien wrote a commentary on the laws of Normandy, which was printed in 1574. This work and the original *Grand Coutumier* still constitute the basis of the law of the English Channel Islands.

In 1577 Henry III. ordered that a new *coutume* be drawn up for Normandy. The royal commissioners stated in their report that the old *coutume* was largely unintelligible and for the most part no longer in use; and in their revision they omitted some of the most important institutions, which give to the Norman law its historical importance, including the incompletely developed jury. The new *coutume* remained in force until the Code Napoléon gave France a common law.

BIBLIOGRAPHY. Brunner, *Das anglonormannische Erbfolgesystem* (Leipzig, 1869); id., *Die Entstehung der Schwurgerichte* (Berlin, 1871); id., "Die Quellen des normannischen Rechts," in Holtzendorff, *Encyklopädie der Rechtswissenschaft* (5th ed., Leipzig, 1890); and "Die Quellen des anglonormannischen Rechts" (ibid.); Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899). Both in Brunner's encyclopædia articles and in Pollock and Maitland full references are given to the sources and the older literature.

NORMANN, nôr'mân, EILEST ADELSTEN (1848—). A Norwegian landscape painter, born at Bodø. He studied (1869-73) under Eugen Dückér at the Academy in Düsseldorf, whence he afterwards made annual trips to his native country. The Norwegian fjords and their majestic surroundings furnished the themes for most of his works, executed with truly poetic conception and luminous in color. In 1887 he removed to Berlin, where his style gradually changed to a more realistic treatment. His best known views include: "Harbor of Bodø" (Düsseldorf Gallery), "Midnight in Lofoten Islands" (Cologne Museum), "Romsdals Fjord" (Stockholm Museum), "Summer Night in Lofoten Islands" (National Gallery, Berlin), "Narø Fjord" (Dresden Gallery and Museo Civico, Turin), "Sogne Fjord" (Rudolphinum, Prague, and National Museum, Budapest).

NORMANS (OF. *Norman*, *Normand*, from Dan. *Normand*, Icel. *Norþmaðr*, Northman, from Icel. *AS. norþ*, OHG. *nord*, Ger. *Nord*, north, probably connected with Umbrian *neritro*, to the left, Gk. *νεπρος*, *nerteros*, lower + *maþr*, Goth. *manna*, AS. OHG. *man*, Ger. *Mann*, man). A name generally restricted in its application to those sea rovers who established themselves in the part of France called, after them, Normandy; but sometimes embracing also the early inhabitants of Norway. During the Middle Ages the name Northmen, or Norsemen, was often used in a broader sense, to denote the entire population of Scandinavia. The Germans and French called the piratical hordes who ravaged their shores Normans or Northmen; the Saxons, usually Danes or Eastmen. They were also distinguished

by the latter as *Mark* (or March) men (from *Danmark*), as *Ash-men* (i.e. men of the *ashen-ships*), and as the *Heathen*. The primary cause of the plundering expeditions southward and westward across the seas, undertaken by the Norse Vikings, 'Sea-Kings,' was doubtless the over-population and consequent scarcity of food in their native homes; besides, the relish for a life of warlike adventure, conjoined with the hope of rich booty, strongly attracted them. Finally, discontent with the ever-increasing power of the greater chiefs or kings induced many of the nobles with their followers to seek new homes.

The first Danish Norsemen made their appearance on the eastern and southern coasts of England about 787. In 795 they settled in some of the towns on the coast of Ireland. After 832 their invasions of England were repeated almost every year. In 851 they wintered for the first time in the island, and after 866 obtained firm footing there. The Anglo-Saxon Ethelred I. fought valiantly against them. His brother, Alfred the Great (q.v.), after a long and doubtful struggle, partially reduced them to subjection; nevertheless, he was compelled to leave them in possession of Northumbria and East Anglia, and had not only to defend himself against a new and fierce invasion led by the famous rover Hastings (q.v.), but to contend against the revolts of his Dano-Norman subjects, which continued to trouble his immediate successors. A period of external peace ensued; but in 991 the invasions of the Danes and Norwegians began anew. The Saxon King, Ethelred II., at first sought to buy them off by paying a sort of tribute money, called *Danegeld* (q.v.); but the massacre of the Danes living in England, by command of that monarch, November 13, 1002, was avenged by four expeditions under the Danish King, Sweyn, who frightfully wasted the country, and finally conquered it in 1013, dying the following year. His son, Knut, or Canute (q.v.), after carrying on a struggle for the supreme power with Ethelred and his successor Edmund Ironside (q.v.), at length, on the death of the latter, became sole monarch of England, which now remained under Danish or Norse rulers till 1042. The government of the country then reverted into the Saxon hands of Edward the Confessor (q.v.), who was succeeded in 1066 by Harold II. (q.v.), son of the powerful Godwin (q.v.), Earl of Wessex; but in October of the same year Harold lost his life and crown at the battle of Hastings, and William the Conqueror, a descendant of a Norwegian chief who had settled in Normandy, once more established a Norse dynasty on the throne of England.

It was also Danish Norsemen, in particular, who ravaged the western coasts of the European mainland, from the Elbe to the Garonne. As early as 810 the Danish King, Gottfried, had overrun Friesland; but the power of Charles the Great was too much for these undisciplined barbarians, and they were overawed and subdued for a time. Soon after his death, however, they recommenced (c.820) their piratical expeditions, and, favored by the weakness and dissensions of the Carolingian rulers, became, during the ninth century, the terror and scourge of North-western Germany and France. They plundered Hamburg several times, ravaged the coasts of the Frisians (whose country then extended as far as the Scheldt), and in 843 firmly planted themselves at the mouth of the Loire. Ere long

they swarmed up the great rivers into the interior of the country, which they devastated far and wide. In 842 they were at Rouen. In 845 they ascended the Seine and plundered Paris—an exploit which was frequently repeated. In 885 not less than 40,000 of these Vikings, in 700 vessels, are said to have ascended the river from Rouen, under the leadership of one Siegfried, and besieged the capital for ten months. It was only saved at the expense of Burgundy, which was abandoned to their ravages. In 881 Louis III., King of the West Franks, inflicted a severe defeat on the invaders at Vineu, near Abbeville, in Picardy; but neither that nor the repulse which they sustained from the brave German monarch Arnulf near Louvain in 891 could hinder them from making fresh irruptions. In 892 they appeared before Bonn, and tradition says that bands of Danish rovers penetrated even into Switzerland, and established themselves in the Canton of Schwyz and the Vale of Hasli. From their settlements in Aquitania they proceeded at an early period to Spain, plundered the coasts of Galicia in 844, and subsequently landed in Andalusia, but were defeated near Seville by the Arab prince Abd-ur-Rahman. In 859-860 they forced their way into the Mediterranean, plundered the shores of Spain, Africa, and the Balearic Isles, and penetrated up the Rhone as far as Valence; then, turning their piratical prowls in the direction of Italy, entered the Tyrrhenian Sea, burned Pisa and Lucca, and actually touched distant Greece before their passion for destruction was satiated.

Doubtless Norwegian rovers also took part in these so-called Danish expeditions. We know that as early as the beginning of the ninth century they made voyages to the north of Ireland, Scotland, the Hebrides, the Orkney and Shetland Isles; and the increasing power of Harald Haarfagr (q.v.), in the ninth and tenth centuries, exciting great discontent among the smaller chiefs, great emigrations took place, and these islands became the new homes of these Norwegian Vikings. About the same period colonies were settled in the Farøe Isles and Iceland, from which some Vikings proceeded westward across the North Atlantic to Greenland about 983, and thence about 20 years later southward to a region which they called *Vinland*, believed by some to be the coast of Canada or of New England, thus probably anticipating the discovery of America by Columbus by nearly 500 years. From Norway also issued the last and most important expedition against the coast of France. It was led by Hrolf or Rollo (q.v.). Hrolf forced Charles the Simple to grant him possession of all the land in the valley of the Seine, from the Epte and Eure to the sea (911 or 912). The invaders firmly planted themselves in the country, which henceforth went by the name of Normandy (q.v.). They and their descendants are, strictly speaking, the Normans of history. They rapidly adopted the more civilized form of life that prevailed in the Frankish kingdom—its religion, language, and manners. At a later period, the twelfth century, they even developed a great school of narrative poetry, whose cultivators, the *Trouveurs*, or *Trouvères*, rivaled in celebrity the lyrical troubadours of Southern France. But though the Normans had acquired comparatively settled habits in France, the old passion for adventure was still strong in their blood; and in the course of the eleventh century many nobles with their

followers betook themselves to Southern Italy, where the strifes of the native princes, Greek and Arab, opened up a fine prospect for ambitious designs. In 1059 Robert Guiscard (q.v.), one of the ten sons of the Norman Count Tancred de Hauteville, all of whom had gone thither, was recognized by Pope Nicholas II. as Duke of Apulia and Calabria. His brother and liegeman, Roger, conquered Sicily. Roger II. of Sicily united the two dominions in 1127 and in 1130 assumed the title of King of Sicily; but in the person of his grandson, William II., the Norman dynasty became extinct, and the kingdom passed into the hands of the Hohenstauffen family. These Normans of Italy played also a considerable rôle in the Crusades, especially in the first, of which Bohemund I. (q.v.) and Tancred (q.v.) were among the principal leaders. See CRUSADES.

The Swedish Norsemen directed their expeditions chiefly against the eastern coasts of the Baltic—Courland, Esthonia, and Finland—where they made their appearance in the ninth century, at the very time when their Danish and Norwegian brethren were roving over the North Sea, the English Channel, and the Bay of Biscay, and were establishing themselves on the shores of England and France. According to the narrative of the Russian annalist Nestor, they appear to have penetrated into the interior as far as Novgorod, whence they were quickly banished by the native Slavic and Finnish inhabitants, but were as quickly solicited to return and assume the reins of government. Rurik (q.v.) founded one kingdom at Novgorod (862), which stretched northward as far as the White Sea. His successor, Oleg, united with that a second, established by other Swedish adventurers at Kiev. (See RUSSIA.) For a long period these Norsemen, who, it appears, became completely identified with their Slavic-speaking subjects in the tenth century, were dangerous enemies of the Byzantine Empire, whose coasts they reached by way of the Black Sea, and whose capital, Constantinople, they frequently menaced, as, for instance, when Igor is said to have appeared before the city with upward of 1000 ships or boats, about the middle of the tenth century. Earlier in the same century these warriors had found their way into the Caspian Sea, and actually penetrated as far as Persia. Partly from them and partly from native Scandinavians came those soldiers who from the ninth to the twelfth century formed the bodyguard of the Byzantine emperors, the celebrated Varangians (q.v.). Consult: Depping, *Histoire des expéditions maritimes des Normands* (2d ed., Paris, 1843); Freeman, *History of the Norman Conquest* (Oxford, 1867-76); Delarc, *Les Normands en Italie* (Paris, 1883); Keary, *Vikings in Western Christendom* (London, 1891); Du Chaillu, *Viking Age* (New York, 1890); Oman, *History of the Art of War* (London, 1898).

NORMANTON, nor'man-ton. A town in the West Riding of Yorkshire, England, near the Calder, eight miles southeast of Leeds (Map: England, E 3). It is an important railway junction, and has coal-mining industries and iron works. Population, in 1891, 10,200; in 1901, 12,350.

NORNS (Icel. *Nornir*, Fates). The Fates of the Scandinavian mythology. They were three young women, by name Urd, Verdandi, and

Skuld—i.e. past, present, and future. They sit by the Urdarwell under the world-tree Yggdrasil, and there determine the fate both of gods and men. Every day they draw water from the spring, and with it and the clay that lies around the wells sprinkle the ash-tree Yggdrasil, that its branches may not rot and wither away. Besides these three great norns, there are also many inferior ones, both good and bad; for, says the prose Edda, when a man is born there is a norn to determine his fate; and the same authority tells us that the unequal destinies of men in the world are attributable to the different dispositions of the norns. These lesser norns corresponded to the *genii* of classic mythology. Women who possessed the power of prediction or magic also bore this name.

NORONA, *nô-rô'nyâ*, GASPARE MARIA DE NAVA ALVAREZ, Conde de (1760-1815). A Spanish poet and soldier, born at Castellón de la Plana. He served with distinction at the siege of Gibraltar and afterwards was made lieutenant-general. He had meanwhile been Ambassador to Russia. At the time of the French invasion he was Governor of Cadiz. His works include: *Madama Gonzales*, a tragedy; *El hombre marcial* and *El cortejo enredador*, comedies; *Poesías* (1799); and *Ommi-ada* (1816), an epic poem of 15,000 verses, pronounced very dull reading. A selection of his works is found in *Biblioteca de autores españoles*, vol. lxiii. (Madrid, 1871).

NORRIDGEWOCK (properly *Nakrantswak*, where the river falls again). A tribe of Algonquian stock (q.v.), the leading member of the Abnaki (q.v.) confederacy. Their principal village, which bore the tribal name, was on the left bank of the Kennebec River, just below the rapids at Indian Old Point, near the present Norridgewock, Maine. Their territory embraced the whole Kennebec River region nearly to the coast, whence they were frequently called Kennebec Indians. The French established a mission at Norridgewock in 1688, and in 1695 the Jesuit Rasse took up his residence there, where he remained for the rest of his life, and succeeded in attaching the tribe so warmly to the French cause that they came to be regarded as the most dangerous enemies of the English colonists. In 1724 an expedition was sent against the settlement, which resulted in the destruction of the village and the dispersion of the tribe, Rasse himself being shot. A part of the fugitive Norridgewock afterwards returned and rebuilt their village, but on a second attack by the English in 1749 they retired to Canada, most of them joining the other New England refugees at Saint Francis.

NORRIS, EDWIN (1795-1872). An English Orientalist, born in Taunton, Somerset. He was one of the first to decipher the Assyrian cuneiform inscriptions, was intimately associated with Rawlinson at various times, and published three parts of an *Assyrian Dictionary* (1868-72). His other works include studies of African dialects, an *Ethnographical Library*, of which, under his editorship, there appeared two volumes, and *The Ancient Cornish Drama* (1859), with an essay on Cornish grammar.

NORRIS, FRANK (1870-1902). An American novelist, born in Chicago, Ill. He studied art in Paris from 1887 to 1889, and pursued literary courses at the University of California and at

Harvard. *Yberville*, a story of Spanish life in old California, appeared in 1891. He was correspondent in South Africa for the *San Francisco Chronicle* at the time of the Jameson Raid, in 1896 and 1897 edited the *San Francisco Wave*, and in 1898 was a war correspondent in Cuba. *McTeague* (1899), a realistic story, was his first novel to attract attention. *Moran of the Lady Letty* (1900) is a story of adventure off the California coast. *The Octopus*, the first novel of a trilogy embodying an 'epic of the wheat,' was published in 1901. It concerns the growing of the wheat and arraigns the oppressive methods of railroad monopoly as existing in California. *The Pit* (1903) deals with the battles over the exchange of the wheat. The last part, *The Wolf*, as planned, was to depict the struggle for the wheat in a famine-stricken community in Europe. At the time of his death he held a position as literary adviser in a publishing house in New York City.

NORRIS, HENRY (?-1536). An English courtier, son of Sir Edward Norris of Norreys. As a young man he became a favorite with Henry VIII., and was an opponent of Wolsey, to whose fall he contributed. Norris's attempts to advance Anne Boleyn were entirely successful, but his intimacy with her gave his enemies at court a means of attack. He was accused of an intrigue with her, quite unjustly it would seem, and was executed in 1536. His son became Baron Norris of Rycote.

NORRIS, WILLIAM EDWARD (1847-). An English novelist, born in London. After going through Eton he went to the Continent to study languages, with the intention of entering the diplomatic service, but, changing his plans, he studied law, and was admitted to the bar in 1874, though he has never practiced. His short stories, contributed to the *Cornhill Magazine*, attracted the especial notice of the editor, Leslie Stephen, by whom he was encouraged to attempt the longer novel. *Heaps of Money* (1877) was followed by *Mademoiselle de Mersac*, a serial in *Cornhill* for 1879, and *Matrimony* (1880), a novel showing fine discrimination in character-drawing. Among his other novels are: *No New Thing* (1882); *Thirly Hall* (1883); *Adrian Vidal* (1884); *A Bachelor's Blunder* (1885); *My Friend Jim* (1886); *Major and Minor* (1887); *The Rogue* (1888); *Miss Shafto* (1889); *Mrs. Fenton* (1889); *Marvita* (1890); *Mr. Chaine's Sons* (1891); *His Grace* (1892); *A Deplorable Affair* (1893); *The Dancer in Yellow* (1896); *Clarissa Furiosa* (1897); *The Widower* (1898); *Giles Ingilby* (1899); *An Octave* (1900); *Lord Leonard the Luckless* (1903).

NORRISTOWN. A borough and the county-seat of Montgomery County, Pa., 18 miles west by north of Philadelphia; on the Schuylkill River, the Schuylkill Canal, and the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, F 3). It is beautifully situated among hills and on the Schuylkill and two tributaries, and is popular as a place of residence. Among the institutions here are the county prison, the Norristown Hospital for the Insane (State), Charity Hospital, the Agnes Stinson Home for Aged Ladies, Friends' Home, Saint Joseph's Protectory (Roman Catholic) for girls, McCann Library (public), and Montgomery County Historical Society. Other prominent

buildings and places of interest are the county court house, municipal building, high school, Masonic Temple, Montgomery Cemetery, with a tomb of Gen. W. S. Hancock and a shaft to Gen. John F. Hartranft, the Schuylkill Bridge (1829), and Valley Forge, but six miles distant. Norristown is in a rich agricultural and mining region, and has extensive manufactures of glass, wire, screws, iron, hosiery, knitting machines, shirts, etc. The government is administered by a burgess, elected every three years, and a unicameral council, which controls elections of subordinate municipal departments. The borough owns and operates its electric light plant. Founded in 1785 and named in honor of Isaac Norris, who had formerly owned a large part of the land in this vicinity, Norristown was incorporated as a borough in 1812, its population then being about 500. It was enlarged in 1853. It is claimed that the earliest settlement here was in 1688 by Friends from Wales. Population, in 1890, 19,791; in 1900, 22,265.

NORRKÖPING, nôr'chê-pîng. A seaport on the east coast of Sweden, situated at the head of the Bråvik, 75 miles southwest of Stockholm (Map: Sweden, G 7). It is regularly laid out with streets crossing at right angles, and has several beautiful parks, squares, and promenades. There are many fine modern buildings, among the best of which are the almost palatial public schools, the new Church of Saint Matthew, the city hall, and the labor lyceum. The Motala, which flows through the town, is extensively utilized for water power, and Norrköping is one of the foremost manufacturing towns of Sweden. In 1900 there were 175 factories, whose products for the year were valued at \$9,650,000. The most important manufactures are woolen and cotton textiles, paper, tapestries, and sugar. Norrköping is also one of the most important commercial ports in the country. Its harbor admits the largest vessels. The shipping in 1899 amounted to nearly 375,000 tons. The chief exports are manufactured goods, grain, wood, and dairy products. Population, in 1890, 32,826; in 1900, 41,008.

NORRLAND, nôr'lânt. The northernmost and largest, but least populous, of the three historical divisions of Sweden. It extends south as far as Gefle, and has an area of 80,785 square miles, with a population in 1901 of 860,254.

NORSEMEN, or **NORTHMEN**. See **NORMANS**.

NORSE MYTHOLOGY. See **ÆSIR**; **SCANDINAVIAN MYTHOLOGY**.

NORTH, CHRISTOPHER. The pseudonym of the part author of the *Noctes Ambrosianæ*, John Wilson (q.v.).

NORTH, FRANCIS, Baron Guilford (1637-85). A celebrated English jurist. He was born November 2, 1637, the third son of the fourth Lord North. Prejudiced against Presbyterians by the sternness of his early teachers, North was confirmed in this feeling by Dr. Stevens, a sturdy Royalist, head of the school at Bury Saint Edmund, where he finished his preparation for college. Matriculated at Saint John's College, Cambridge, he withdrew in two years to become a student of law in the Middle Temple. He was admitted to its practice in 1661, and as he had always been a student of great application, he

soon gained a high rank at the bar. Indeed, his rise in favor at the Court was so rapid that he has been accused of using unworthy means to gain his end. He became Solicitor-General in 1671, Attorney-General in 1673, and Lord Chief Justice of the Common Pleas in 1675. In 1682 he was made Lord Keeper of the Great Seal. With other members of the Court party he was hostile to Titus Oates, and as judge ruled in such a manner against Stephen College that it aided in securing a death sentence. This act constitutes the most serious blot on his fame as a judge, for in most cases his decisions were marked by their ability and justice. He was a Royalist, true to Charles II. at all times. In 1683 he entered the House of Lords as Baron Guilford, but took little part in its proceedings. He was a man of vast knowledge and wide culture, an excellent musician, a patron of artists, and a friend of natural sciences, yet withal too complaisant to the corruptions of his day. As a lawyer his ability and learning were undoubted, and his decisions did much to increase the jurisdiction of the Court of Common Pleas. Consult Roger North, *The Lives of the Norths* (London, 1890).

NORTH, FREDERICK, Lord, Earl of Guilford (1732-92). An English statesman. He was a son of Baron Guilford. After a course at Eton and Trinity College, Oxford, and a period of Continental travel, North was at the age of twenty-two sent to the House of Commons as member from Banbury, a borough controlled by his father. From 1759 until the fall of the Rockingham Ministry in 1765 he held the position of a junior lord of the treasury. In December, 1766, after a short tenure of the office of paymaster, he was admitted as a member of the Privy Council. His ability won for him, in March, 1767, an offer of the chancellorship of the exchequer, which he at first declined, but upon the death of Townshend in September finally accepted. With this post went the leadership of the House of Commons, for which he was well qualified by his eloquence, good humor, wit, and readiness of resource. His attitude on the Townshend tea tax, however, was one of the immediate causes of the American war. It was North's own boast that as a member of the Commons he had "voted against all popular and in favor of all unpopular measures." In 1770 he succeeded the Duke of Grafton as Prime Minister. He was called by Horace Walpole the ostensible Minister; for the real Minister was King George III. It has since been proved that North as early as 1776 believed that the unyielding policy he was pursuing with regard to the American colonies would end in ruin to the King and to the country; yet in the face of the powerful opposition of Fox and Burke, he allowed his own convictions to be overborne by the obstinacy of King George's ultra-Tory purpose. In 1778 he was forced to a renunciation of the right to tax the colonies; but the concession came too late, and in 1782, finding it impossible to carry on the war any longer, he resigned. With North's retirement came to an end George III.'s scheme of governing the country by his own will, and of ruling the House of Commons. Soon, however, Fox entered into a coalition with North, against whom he had for so many years inveighed. North and Fox took office under the

Duke of Portland in 1783, but the coalition lasted only a few months. He succeeded his father as Earl of Guilford in 1790. During the last five years of his life North was totally blind. He bore his afflictions with great cheerfulness. He died August 5, 1792. North was an amiable man, possessed of considerable wit and talent, but lacking those powers necessary to carry a country well through a crisis like that which England experienced during his administration. Consult Donne, *Correspondence of George III. with Lord North* (London, 1867).

NORTH, Sir THOMAS (1535?-1602?). An Elizabethan translator, the son of Edward, first Baron North, and younger brother of Roger North (1530-1600), the courtier and soldier. He was probably educated at Peterhouse, Cambridge, and certainly studied at Lincoln's Inn (1557). In 1588 he was captain of three hundred men at Ely; was styled a man of courage; and was knighted in 1591. In 1601 he received a pension of £40 for his 'good and faithful service.' North, a master of clear and robust English, performed still greater service to literature. Under the title *The Diall of Princes* (1557), he Englished the Spaniard Guevara's *Libro aureo*. North's version was exceedingly popular. From the Italian of Antonio Francesco Doni he published the *Morall Philosophie of Doni* (1570; reprint by J. Jacobs, London, 1891), a collection of Eastern fables. Better known now is his version of Plutarch's *Lives* (1579; 2d edition 1595; enlarged 1603), made from the French of Amyot. It was the source of Shakespeare's Roman tragedies. Consult the reprint of the first edition of North's Plutarch, ed. by Wyndham (Tudor Library, London, 1895).

NORTH, WILLIAM (1752-1836). An American soldier, born at Fort Frederick, Maine. He entered the Revolutionary army in 1775, and in 1778 was a captain at the battle of Monmouth. The next year he was transferred to the staff of Baron Steuben and remained with him until the surrender of Cornwallis. He left the army with the brevet rank of brigadier-general, and went to live with Steuben, whose favorite he had become. A zealous Federalist, he took an active interest in politics, and was a member of the United States Senate in 1798-99. During the trouble with France in 1798 he was appointed adjutant-general of the army with the rank of brigadier-general. He wrote a valuable memoir of Baron Steuben.

NORTH ADAMS. A city, including several villages within its corporate limits, in Berkshire County, Mass., 21 miles north of Pittsfield; on the Hoosac River, and on the Boston and Albany and the Boston and Maine railroads (Map: Massachusetts, A 2). An attractive feature of the city is its beautiful location, amid mountain scenery, at the foot of Greylock, the highest mountain in the State. It is near the western end of the famous Hoosac Tunnel, and the natural bridge which spans Hudson Brook at a height of 50 feet is in North Adams. The more prominent institutions are a State normal school, North Adams Library, and North Adams Hospital. The principal industries include the manufacture of cotton, woolen, and print goods, boots and shoes, machinery, etc. North Adams was one of the first places in the United States east of the Pacific slope where Chinamen were em-

ployed. The government is administered, under the charter of 1895, by a mayor, annually elected, and a unicameral council, elected on a general ticket. The majority of subordinate municipal officials are appointed, either absolutely or with the consent of the council, by the executive, but with these exceptions: city clerk and auditor of accounts, elected by the council, and assessors, trustees of public library, and school committee, chosen by popular vote. The water-works are owned and operated by the municipality. Population, in 1890, 16,074; in 1900, 24,200. Settled about 1765, North Adams was separated from Adams and incorporated as a town in 1878. In 1895 it became a city. The site of Fort Massachusetts, which was captured by the French and Indians under Vaudreuil in 1746, is in the western part of the city. Consult Spear, *History of North Adams* (North Adams, 1885).

NORTHALLERTON. A market-town in the North Riding of Yorkshire, England, 30 miles northwest of York (Map: England, E 2). It has a large number of public schools and other institutions, manufactures of linen and leather, brick-making, and malting. It is famous as the place where the battle of the 'Standard,' so called from a high standard erected on a car by the English, was fought, August 22, 1138, between the English under the earls of Albemarle and Ferrers and the Scotch under King David. The latter were defeated. Population, in 1891, 3802; in 1901, 4009. For the history, consult Ingledew (London, 1858) and Saywell (Northallerton, 1886).

NORTH AMERICA. See AMERICA.

NORTHAMPTON. The capital of Northamptonshire, England, a market-town, Parliamentary and municipal borough, on rising ground on the Nen, 67 miles northwest of London (Map: England, E 4). The principal edifices are the shire hall, the handsome town-hall, the corn exchange, the numerous churches, several of which are unusually interesting, as Saint Peter's, a restored specimen of enriched Norman, and Saint Sepulchre's, one of the four round churches in the Kingdom, and dating from the twelfth century. Northampton has numerous endowed charitable and educational establishments. It is a horse-racing centre, and two meetings annually are held on a fine course in the suburbs. The town owns the water supply, markets, and a sewage farm; maintains a free library, museum, cemetery, fire brigade, and police force; and provides technical instruction. Northampton is the centre of the English shoe-making industry, and has currying works, iron foundries, maltings, breweries, flour and paper mills, and brick and tile works. Of early English origin, in the *Saxon Chronicle* it is called Mamp-tune. It was long in the possession of the Danes, who burned it in 1010. It was walled and strongly fortified by Simon de Saint Liz in 1075. During the Civil War it was held for Parliament. The meadows below the town witnessed the defeat of Henry VI. by the Yorkists in 1460. Population, in 1891, 75,075; in 1901, 87,021. Consult: *Liber Custumarum: the Ancient Customs of the Town of Northampton* (Northampton, 1895); Adkins, *Northampton in English History* (London, 1898).

NORTHAMPTON. A city, including several villages, and the county-seat of Hampshire Coun-

ty, Mass., 17 miles north of Springfield; on the Connecticut River, and on the Boston and Maine and the New York, New Haven and Hartford railroads (Map: Massachusetts, B 3). The city, which occupies elevated ground and is noted for its beautiful scenery, has become widely popular as a summer resort. It has, among noteworthy institutions, Smith College (q.v.), the Clarke Institute for Deaf Mutes, richly endowed by John Clarke, Northampton Insane Hospital (State), Smith Charities, Cooley Dickinson Hospital, Home for Aged and Invalid Women, the Burnham Classical School, Public, Forbes, and Lilly libraries, Memorial Hall, and Academy of Music. Among the conspicuous edifices are the court house and high school building. In the immediate vicinity of Northampton are Mount Tom and Mount Holyoke, both ascended by mountain railways and commanding magnificent views. The principal industries are the manufactures of silk, cutlery, brushes, lumber products, furniture, hosiery, wood pulp, emery wheels, boxes, foundry products, baskets, sewing machines, pocketbooks, etc. The government is administered, under the charter of 1883, by a mayor, annually elected, and a bicameral council, which controls appointments of the subordinate departments, excepting those of schools and the Forbes Library, chosen by popular vote. The water-works are owned and operated by the municipality. Population, in 1890, 14,990; in 1900, 18,643. Northampton was first settled in 1654 by a small company from Springfield, and was named (in 1655) after Northampton, England. In 1676, during King Philip's War, it was attacked by Indians. Jonathan Edwards was minister here from 1729 until dismissed in 1750. Northampton was chartered as a city in 1883. Consult Trumbull; *History of Northampton* (Northampton, 1898).

NORTHAMPTON, Assize of. A royal decree issued in January, 1176, by Henry II. of England. Like the Assize of Clarendon (q.v.), it is in the form of instructions to the itinerant justices. The penalties are severer than they were in the earlier document, and there are special orders in regard to difficulties due to the rebellion of 1173 against Henry II. (q.v.), which had centred about Henry's eldest son and namesake. Consult: Stubbs, *Constitutional History of England*, vol. i. (8th ed., Oxford, 1897); id., *Select Charters* (8th ed., Oxford, 1895), for the Latin text; Adams and Stephens, *Select Documents of English Constitutional History* (New York, 1901), for an English translation of the document.

NORTHAMPTONSHIRE, or NORTHANTS. A southern midland county of England, bounded on the north by Lincoln, Rutland, and Leicester, on the east by Bedford, Huntingdon, and Cambridge, on the south by Oxford and Buckingham, and on the west by Warwick and Oxford (Map: England, F 4). Area, 998 square miles. The surface generally is undulating and well wooded; the northeast belongs to the Bedford Level (q.v.). The chief rivers are the Nen, Welland, and Avon. Stock-raising and the cultivation of pasture land are the chief branches of agriculture, but Northamptonshire is principally an iron-producing and manufacturing county. Northampton (the capital), Peterborough, Wellingborough, Daventry, and Kettering are the principal towns. Population, in 1891, 302,183; in 1901, 338,064. Con-

sult Baker, *History and Antiquities of the County of Northamptonshire* (London, 1841).

NORTH ANDOVER. A town in Essex County, Mass., 28 miles north of Boston and two miles southeast of Lawrence; on the Boston and Maine Railroad (Map: Massachusetts, E 2). It is important both as a residential place and as a manufacturing centre. There are several large woolen mills and manufactories of woolen mill machinery. North Andover was set off from Andover and incorporated as a town in 1855, the original form of government, by town meeting, still prevailing. The town owns and operates the water-works. Population, in 1890, 3742; in 1900, 4243.

NORTHANGER (nóth-an'jēr) ABBEY. A novel by Jane Austen (1818). It is a picture of commonplace English life in the latter part of the eighteenth century at Bath and at the Abbey, the countryplace of friends of the heroine, Catherine Morland. It was written early in her career (though not published till after her death) with a view of showing that the every-day life of ordinary people could be made as interesting as the absurd romances, like the *Mysteries of Udolpho*, which were then popular.

NORTH ATTLEBORO. A town, including several villages, in Bristol County, Mass., 32 miles south-southwest of Boston; on the New York, New Haven and Hartford Railroad (Map: Massachusetts, E 4). It has the Richards Memorial Library (public), with 6000 volumes. There are extensive manufactories of jewelry, also establishments producing jewelers' supplies, cotton yarn, silverware, rope, braid, boxes, buttons, etc. North Attleboro was incorporated in 1887; its government is administered by town meetings. The water-works and electric light plant are owned by the municipality. Population, in 1890, 6727; in 1900, 7253.

NORTH BAY. A town in Nipissing district, Ontario, Canada; on Lake Nipissing, and the Canadian Pacific and Grank Trunk railroads (Map: Ontario, D 1). Small steamers ply on the lake, and the place is much visited by tourists and fishing parties. There is a United States consular agent. Population, in 1901, 2530.

NORTH BERWICK, bē'wīk. A seaport town in Haddingtonshire, Scotland, at the entrance to the Firth of Forth, 19 miles east-northeast of Edinburgh (Map: Scotland, F 3). Formerly a fishing-village, North Berwick has now become a watering-place, noted for its fine sandy beach, and its five-mile course golf links. Near by are Bass Rock, North Berwick Law, and the ruins of Tantallon Castle, graphically described in Scott's *Marmion*. Tantallon Castle is an irregular pile, two miles east of the town, on a high rock, surrounded by the sea on three sides, with a ditch on the land side, where there was formerly a drawbridge. North Berwick Law is a conical hill of an elevation of 612 feet, on the south, close to the town. Population, in 1891, 1500; in 1901, 2784.

NORTH BRABANT. A province of the Netherlands, adjoining Belgium and occupying the northern part of Brabant (q.v.) (Map: Netherlands, D 3). Area, 1980 square miles. It has a low surface and belongs to the basin of the Meuse. Agriculture and the raising of domestic animals are the chief occupations, but the manufacturing

industries are also well developed. The chief manufactures are cotton and woolen fabrics, linen, hats, leather, etc. Population, in 1889, 509,628; in 1899, 553,845.

NORTH BRADDOCK. A borough in Allegheny County, Pa., ten miles from Pittsburg, on the Pennsylvania Railroad (Map: Pennsylvania, B 3). It is mainly a residential and manufacturing place, and has a large plant, making chiefly steel rails, of the United States Steel Corporation. Organized from a part of Braddock Township, North Braddock was incorporated in 1897; its government is administered by a burgess, elected every three years, and a council. Population, in 1900, 6535.

NORTH BRIDGE. A town, including several villages, in Worcester County, Mass., 13 miles southeast of Worcester; on the Blackstone and Mumford rivers, and on the New York, New Haven and Hartford Railroad (Map: Massachusetts, D 3). The town has a public library, and its industrial interests are represented by extensive manufactures of cotton mill machinery, cotton and woolen goods, etc. Settled in 1662, Northbridge was set off from Mendon and incorporated as a separate town in 1772. The government is administered by town meetings. The water-works are owned and operated by the Whitin Machine Works, one of the town's great manufacturing plants. Population, in 1890, 4603; in 1900, 7036.

NORTH BROOK, EARL. See **BARING, THOMAS GEORGE.**

NORTH CAPE. A promontory projecting into the Arctic Ocean from the island of Magero (q.v.), off the north coast of Norway, in latitude $71^{\circ} 11'$ north (Map: Norway, L 1). It is generally considered as the northernmost point of Europe, though a little to the west of it a low point of land, the Knivskjoerodde, extends a few minutes farther north. The northernmost point of the European mainland is Cape Nordkyn, 44 miles east of North Cape, in latitude $71^{\circ} 7'$. North Cape is a precipitous rocky headland, rising 988 feet above the sea. Its summit is crowned by a granite monument; in summer it is visited by numerous tourists.

NORTH CAROLINA (popularly called the 'Old North State,' also the 'Turpentine State'). A South Atlantic State of the United States. It lies between $33^{\circ} 50'$ and $36^{\circ} 33'$ north latitude, and between $75^{\circ} 27'$ and $84^{\circ} 20'$ west longitude. It is bounded on the north by Virginia, on the east and southeast by the Atlantic Ocean, on the south by South Carolina and Georgia, and on the west by Tennessee. Its extreme length from east to west is $503\frac{1}{4}$ miles, and its extreme breadth $187\frac{1}{2}$ miles, the average breadth being about 100 miles. Its area is 52,250 square miles, including the large coast lagoons, the land surface covering 48,580 square miles, or 31,091,200 acres. Its gross area is, according to the latest official figures, exactly equal to that of Alabama, and is exceeded by 23 of the other States. In land area North Carolina ranks 25th.

TOPOGRAPHY. The State may be divided into three distinct topographical belts, the Appalachian mountain region in the west, the Piedmont plain in the middle, and the coastal plain in the east, the dividing lines between these running obliquely across the State from southwest to

northeast. The mountain belt, taken as a whole, consists of a high plateau covering about 6000 square miles and lying at an average elevation of 2000 to 5000 feet. It is bounded on the east by the Blue Ridge, which rises in a steep and rugged escarpment from the Piedmont plain to a height of nearly 4000 feet above sea level in the north, becoming lower southward. On the west the plateau is bounded by the Great Smoky Mountains, whose crest separates North Carolina from Tennessee. Between these ridges the plateau itself is much dissected by river valleys running in all directions, and broken up into cross ranges and irregular mountain groups. These are generally rounded, forest-covered heights, but there are several pointed peaks, and some precipitous slopes and rocky cliffs. More than twenty-five peaks are over 6000 feet high. Their summits are generally bare. The highest is Mount Mitchell, in the group known as the Black Mountains, the culminating point of the Appalachian system and the highest peak in the eastern half of the continent. It rises from the centre of the plateau in North Carolina to a height of 6711 feet above the sea.

The portion of the State east of the mountain belt is about equally divided between the Piedmont and the coastal plains. The former reaches its widest development in this State, of whose area it includes nearly one-half. It slopes gradually from an elevation of 1000 feet at the foot of the Blue Ridge to less than 500 feet where it merges into the coastal plain. Its surface is undulating, rugged, and hilly near the mountains, but gradually levels toward the east. It is partly forested, but consists largely of cultivated land, being the most populous and best developed region of the State. The coastal plain occupies the eastern belt stretching from 100 to 150 miles from the coast. It is level and sandy, consisting in parts of pine barrens, and everywhere is less than 500 feet in elevation. It merges through low swamps into the shallow coast lagoons, of which Pamlico and Albemarle sounds are the largest. They are bounded on the ocean front by narrow sand beaches.

HYDROGRAPHY. The greater part of the State belongs to the Atlantic slope, but the western mountain region beyond the Blue Ridge belongs to the Mississippi basin, being drained by the headstreams of the Tennessee River, chief among which are the Little Tennessee and the French Broad River. The eastern slope of the Blue Ridge in this State is the watershed for nearly all the Atlantic rivers of both North and South Carolina, all of them having a generally southeast course. In the northern half of the State the Roanoke, the Tar, and the Neuse enter Albemarle and Pamlico sounds, through deep and wide estuaries. The southern portion is drained by the Cape Fear River, and the western part of the Piedmont plain by the Yadkin or Great Pedee and the Catawba, both of which flow into South Carolina. The large rivers of the coastal plain, especially their magnificent estuaries, offer facilities for communication, and on the Piedmont plain they furnish a vast amount of water-power.

CLIMATE. North Carolina lies in the warmer part of the temperate zone. The climate becomes almost sub-tropical in the southeastern corner. The mean temperature near the coast is 61° , and in the mountains 56° ; the mean summer tempera-

tures for the two regions are 77° and 72°, and the winter temperatures 45° and 40°. The normal maximum is about 100°, and the minimum for the central part of the State 10°, though such cold is rare. In the mountains the winters are more severe, but the Blue Ridge protects the rest of the State from the cold northwest waves. The rainfall is abundant and very evenly distributed, both in regard to seasons and localities, though the central region receives somewhat less rain than the coast and mountain regions, and the summer somewhat more than the other seasons. The annual average for the State is 53.3 inches. The average snowfall is about five inches, but snow rarely remains on the ground more than one or two days. The prevailing winds are from the northeast and southwest. The State lies outside the path of the cyclonic storms, and tornadoes are extremely rare; but the sub-tropical storms from the southwest sometimes endanger navigation along the coast.

FLORA. North Carolina, being the meeting ground of the temperate and sub-tropical floras, and having all varieties of climate from sub-tropical to sub-arctic, is unrivaled by any State east of the Mississippi in the variety of its plant life, and is probably surpassed by no region of similar area elsewhere. In the swamps along the coast the prevailing tree is the bald cypress, with the white cedar and live oak. Here also are numerous bulrushes and several species of carnivorous plants (*Sarracenia* and *Drosera*). In the sandy parts of the coastal plain the long-leaf pine (*Pinus Australis*) is predominant, together with the loblolly-pine (*Pinus taeda*) and scrub oak. Composite and leguminous plants are here abundant, as well as blueberries, sumacs, alders, a profusion of wild grapes and other vines, and, in the south, palmettos. In the Piedmont plain the indigenous species have been largely supplanted by those introduced by settlers. Oaks, hickories, and elms are predominant in the forests of this plain. In the mountains the forest of the common northern trees covers a remarkable and typical northern undergrowth of gorgeous shrubbery, magnolias, rhododendrons, and similar species.

For Fauna, see that section under UNITED STATES.

GEOLOGY AND MINERALOGY. The main geological surface formations are coincident with the topographical belts described above; in fact, the latter are a result of the former, and the coastal plain is a geological rather than a topographical division. It consists of Cretaceous and Tertiary sands, gravels, clays, and marls covering the underlying bed-rock of granites and limestones. The remainder of the State, the Piedmont plain and the mountains, has as its principal feature an immense belt of granites and gneisses running across the State from southwest to northeast, and flanked on the east by a narrower belt of crystalline schists and other slates. Between the latter and the coastal plain deposits is a still narrower belt of more recent formation—the Triassic red sandstone. The Great Smoky Mountains in the extreme west and the southern portion of the Blue Ridge consist of rocks of the Ocoee formation. The red sandstone formation contains coal deposits, and also yields the most valuable building stones. The crystalline rocks, which are much folded,

tilted, and broken, are penetrated in many places by quartz veins, some of which are auriferous. Other veins are impregnated with copper ores, and valuable iron deposits are also found both in the granite and slate belts, while ores of silver, lead, and zinc are also found, sometimes associated with gold.

MINING. Gold-mining began early in the nineteenth century, yet the industry shows little signs of extensive development, and the annual output remains small. The State is noteworthy for its production of corundum and mica, there being few other regions in the country where these are found. In 1900 the corundum mined for the year was valued at \$102,715, and represented all that was mined in the United States during that year. Both corundum and mica are found in the counties west of the Blue Ridge. In 1900 the ores mined included the red and brown hematite and the magnetite varieties of iron ore, their respective outputs being 55,844 tons, 259,863 tons, and 20,479 tons. Coal-mining has been carried on in Chatham County since 1889, but the output is small. Granite quarried in 1900 was valued at \$257,962—much in excess of any other year between 1890 and 1900. The production of talc and soapstone is rapidly increasing, the value in 1900 being \$75,308. Some sandstone and phosphate rock are also obtained. In 1900 the value of brick and tile was estimated at \$797,112. A little pottery is also produced.

FISHERIES. Fishing is the most important industry in the eastern part of the State. North Carolina is naturally adapted for this pursuit by its sounds and other coastal bodies of water, fresh and salt. The annual catch is more than twice that of South Carolina, Georgia, and Florida (Atlantic Coast side) combined. In 1897, the last year in which fishery statistics were compiled, there were 12,045 men engaged in the industry. The value of the product reported was \$1,316,017. Shad and oysters are by far the most prominent, the value of the former being \$362,811. Of the many other varieties the more important are squeteague, alewife, mullet, striped bass, clams, and bluefish. The seine fisheries of the Albemarle Sound section are the most important in the State. Vessel fishing is not yet extensive.

AGRICULTURE. Agriculture is the leading industry. Yet the largest part of the swampy coast land is unreclaimed, and there is also much waste land in the mountainous area of the west. In 1900, 73.2 per cent. of the land surface was included in farms—the largest per cent. recorded since 1860. While the per cent. of improved land is still small, being in 1900 only 36.6 of the farm land, there was a large gain from 1850 to 1900, the corresponding figures for 1850 being 26.0. The most remarkable agricultural development of that half century was the change from large to small farms, the average size having decreased steadily from 368.6 acres in 1850 to 101.3 acres in 1900. This decrease is a part of the general process which the overthrow of slavery precipitated. Negroes who were formerly slaves on large plantations became renters or owners of small holdings. Also the holding of the white farmer was reduced more nearly to an area which it was possible to cultivate by his own efforts. In 1900, 24.4 per cent. of the farms were operated by colored farmers, the average size of the farms being 53.6 acres, or less than half

* Established since the last census was taken..

that of the farms operated by white farmers. The per cent. of rented farms is high, having been 41.4 per cent. of the total number of farms in 1900. Renting is much more common among the negroes than among the whites, the percentage of renters among each being respectively 68.0 and 33.4. In the western counties, where nearly all the farmers are white, the share system of renting prevails. Among the colored farmers of the cotton-growing counties the cash and share tenants are about equal. The negro farmers usually mortgage their crops.

As may be inferred from the paragraphs under *Topography*, there is a great diversity of agricultural products, three agricultural sections being recognized. These are the eastern or coastal plain region, containing much sandy and barren soil; the middle or Piedmont section, more undulating, and with a soil more fertile and better adapted to diversified farming; the western or mountainous section, characterized by a fertile loam and best suited to grazing and the raising of temperate zone crops. The crop which stands out prominently as to acreage is corn, the acreage for 1900 exceeding 47 per cent. of the total crop area, and the receipts equaling 25.2 per cent. of the total crop receipts. Since the Civil War the corn acreage has steadily increased. Wheat, the next most prominent cereal, has only one-fourth as large an acreage. The acreage devoted to oats and rye each decreased one-half from 1890 to 1900. The yield per acre of all these crops is very low. The acreage of hay and forage crops is comparatively small. The two crops which yield the largest receipts from sales are cotton and tobacco. The acreage of each fluctuates greatly. An increase in one usually is accompanied by a decrease in the other, the respective acreages being determined by the rise or fall in the price of one or the other crop. The State ranks about eighth as a cotton State, and cotton does not hold the dominant position it maintains in the Commonwealths farther south. However, there was a very decided increase in production from 1850 to 1900, the crop for 1900—459,707 bales—being over three times that of 1850. The utilization of the seed has greatly increased the value of the cotton yield.

Likewise there has been a large increase in the attention given to tobacco-raising. From 1890 to 1900 the acreage was more than doubled, and North Carolina took rank next to Kentucky. The State holds third rank in the production of peanuts and second in the production of sweet potatoes. The former are grown most extensively in the northeastern counties. They are, however, put on the market bearing the Virginia label, being sold to Virginia factories. The area of production increased enormously during 1890-1900. Garden farming has become a prominent industrial feature. The climate enables gardeners to produce for the early Northern market, and cheap transportation is furnished by ocean navigation. The southeastern or Wilmington section has made the greatest progress in this line. Watermelons, cabbages and other vegetables, and strawberries and other small fruits are there grown in abundance. Orchard fruits are most common in the western part of the State, the apple being the principal variety. Peaches are raised, but not in such great quantities as in other Southern States. Rice is raised

along the tide-water rivers, where the construction of dikes makes possible a system of flooding and draining. In Hyde County, however, irrigation is accomplished by pumping. The last census reported 22,279 acres devoted to rice. Peas and sorghum are among the other crops grown.

The following table of acreages explains itself:

CROPS	1900	1890
Corn.....	2,720,206	2,360,627
Wheat.....	746,984	666,509
Oats.....	270,876	541,851
Rye.....	28,074	56,496
Hay.....	229,998	190,754
Cotton.....	1,007,020	1,147,136
Tobacco.....	203,023	97,077
Peanuts.....	95,856	17,767
Sweet potatoes.....	68,730	71,752

STOCK-RAISING. Stock-raising is of secondary importance. Swine is about the only variety of farm animal raised on a scale which permits any considerable outside shipments. There were five times as many mules and asses in 1900 as in 1850. During that period the number of sheep decreased almost two-thirds, the decrease being the most marked in the last decade. The number of horses has increased considerably since 1870, particularly since 1890. Dairying is becoming more important. The following table needs no further comment:

	1900	1890
Dairy cows.....	233,178	223,418
Other cattle.....	391,340	407,487
Horses.....	159,153	131,451
Mules and asses.....	136,435	100,011
Sheep.....	208,412	402,247
Swine.....	1,300,469	1,251,008

MANUFACTURES. Prior to 1880 the manufactures were little more than such necessary neighborhood industries as are common to rural communities. In the two decades following 1880 the value of products increased 100.9 and 135.1 per cent. respectively, and the corresponding increase in the number of wage-earners engaged was 85.7 and 109.9 per cent. In 1900 the total number of wage-earners was 70,570, or 3.7 per cent. of the total population. The absence of legislation bearing upon child labor is reflected in the unusually large total of persons employed who are under sixteen years of age. They number one-tenth of the total employed. Most mill-owners, however, have agreed to discontinue the employment of children under twelve years of age.

From the table appended it will be seen not only that each of the ten leading industries made gains from 1890 to 1900, but in a number of them the value of the product increased three-fold or more. The manufacture of cotton goods has realized the largest growth. Several favorable conditions have united to bring about this result. The fact that the cotton fields are near the factories results in the saving of the cost of transportation; the cheapness of living results in lower wages; there is a plentiful supply of wood for fuel; and there is, as already mentioned, plenty of water power. The streams of the State, it is estimated, can furnish 3,500,000 horse power, only a little more than one-fifth of which is now utilized. From 1890 to 1900 the value of the manufactured cotton product in-

creased 196.7 per cent., amounting in 1900 to 29.9 per cent. of the total value of the products of the State. The cotton manufactures employed 42.9 per cent. of the wage-earners, the rank of North Carolina during that period rising from tenth to third in the value of this product, Massachusetts and South Carolina alone exceeding it. North Carolina was exceeded by Massachusetts alone in the number of wage-earners in this branch of industry. The spindles now running annually consume an amount of cotton almost equal to the crop grown in the State. The industry is carried on for the most part by small mills scattered over the Commonwealth. The value of cottonseed oil and cake increased over 400 per cent. in the decade 1890-1900.

A number of other important industries are included in the group dependent upon agricultural products, the manufactures of tobacco being of greatest importance. This is one of the earliest established industries in the State. North Carolina has a wide reputation for certain brands of smoking tobacco and cigarettes. The value of the product increased 184.7 per cent. from 1890 to 1900. The manufacture of flour and grist-mill products is another large and flourishing industry. The tanning and currying of leather developed from comparative insignificance into an industry of some prominence during 1890-1900. The following table of the leading industries explains itself:

INDUSTRIES	Year	Number of establishments	Average number wage-earners	Value of products, including custom work and repairing
Total for selected industries for State.....	1890	4,071	55,642	\$77,351,282
	1890	2,068	24,045	26,707,151
Increase, 1890 to 1900.....		2,003	31,597	\$48,644,131
Per cent. of increase.....		96.9	131.4	169.4
Per cent. of total of all industries in State.....	1900	56.3	78.8	81.5
	1890	56.4	71.5	71.1
Cotton goods.....	1900	177	30,273	\$26,372,796
	1890	91	8,515	9,563,443
